COAL AGE

With Which is Consolidated
The Colliery Engineer

INDEX FOR VOLUME VIII

July 1 to December 31, 1915

Note—Illustrated articles are denoted by an asterisk (*), book notices by a dagger (†). Titles are often abbreviated. They are indexed under their most important words, or, if no word be distinctive, under their first one (except "A," "The," etc.), or under some topical word not found in the title. Authors', geographical and other proper names are also used freely. In some cases references to subsequent discussion are appended to a writer's name.

Following is a list of the pages included in the several numbers of the volume, by date:

July 3	pages	1-42
" 10	"	43-78
" 17	"	79-118
" 24	"	119-158
" 31	"	159-200
Aug. 7	"	201-246
" 14	"	247-286
" 21	"	287-326
" 28	"	327-368
Sept. 4	"	369-412
" 11	"	413-448
" 18	"	449-492
" 25	"	493-532
Oct. 2	"	533-578
" 9	"	579-618
" 16	"	619-662
" 23	"	663-700
" 30	"	701-738
Nov. 6	"	739-788
" 13	"	789-830
" 20	"	831-872
" 27	"	873-912
Dec. 4	"	913-960
" 11	"	961-1000
" 18	"	1001-1046
" 25	"	1047-1090

COAL AGE

Vol. 8 NEW YORK, JULY 3, 1915 No. 1

Coke Plants and the War

THE war in Europe has suddenly brought home to the managers of American byproduct ovens the realization that vast quantities of benzol have been wasted and are still going to waste in the coke-oven gases.

> With practically no demand for coke and hundreds of ovens idle the byproduct plants are taxed to capacity and are working overtime to fill orders.

With the price of benzol now ruling, it is quite doubtful whether the coke or the benzol should be classed as the byproduct. There is no question as to which is in greater demand; in fact, at some byproduct plants where there is practically no demand for coke the ovens are being run for the byproducts and the coke is being put in stock piles.

For several years German engineers have been trying to enthuse American coke-oven men with the possibilities of benzol recovery plants, but mostly with poor success; for this the Germans are now undoubtedly thankful, as the benzol recovered from American plants that have been built is being used mostly for manufacturing explosives destined for the Allies. Such is the uncertainty of fate.

If efficient benzol plants could be built overnight, every byproduct coke plant in the United States would have a benzol plant in operation tomorrow. However, since months instead of weeks are required, inefficient makeshift plants are springing up that will pay handsome dividends in spite of their shortcomings. Because of their inefficiency, there is little danger of the market being flooded by the output of benzol.

In their failure to discover these mushroom benzol plants, the Sunday - supplement editors have overlooked the sensation of the year, because the man who is most prominent in their development is none other than Thomas A. Edison, our most famous inventor. Think of the possibilities.

Nor is benzol the only coke-oven byproduct that is in demand just now. Even plain, sticky black tar that used to be a drug on the market and was gladly furnished to mine superintendents who would consent to use it on haulage ropes has suddenly assumed a value that has justified an attempt at cornering the market.

The effect of this unusual activity in byproducts will be noticeable when the coke-oven statistics for the year 1915 are compiled, in that it will greatly increase the proportion of byproduct coke produced for the year. The demand for coke is below normal and hundreds of beehive ovens are idle, but practically every byproduct plant is being run to capacity.

Ideas and Suggestions

Need for an Arbitration Law

By Charlton Dixon*

Now that the long strike has been ended in the "No. 8" field of Ohio a partial counting of the cost is in order. According to Coal Age the miners' union disbursed about one and a half million dollars. This large sum, however, probably amounts to only one-seventh of the aggregate which the miners, under normal conditions, would have earned during the same time at 44.6c. per ton of run-of-mine coal. The loss to the operators owing to the depreciation of their mines, to the dislocation of business and to the expense of maintenance is also serious. The coal irrecoverably lost to the state owing to the caving of rooms, the flooding of workings, etc., is immense.

Like most strikes, that in eastern Ohio had its inception in selfishness, was carried on in stubbornness without reason and terminated without honor or profit to either side.

Why Did So Simple a Solution Take So Much Time and Money?

Was there no means of discovering over 12 months ago that there was no other settlement possible than the one finally adopted? Had there been an interested third party with authority to speak and act before a cessation of operations took place—or in other words, had there been a compulsory arbitration board as in Canada—there would in my opinion have been no strike.

There was not a day in the 13½ months of strife when the operators would not have welcomed the assistance of such a board. They were always ready and willing to state the facts of their side as they did unreservedly before the investigating committee which Washington sent after a long wait.

The "No. 8" mine owners were given to understand that the settlement at the end of the biennial period would be based on the Pittsburgh district price—44.6c. for run-of-mine coal, the price paid then and now. The slack average proved that this price was fair and in all honor was the one to be adopted. Instead of the union favoring it, a demand was made for a higher figure, for which that organization was, however, unable to prove any just claim.

In the Hocking Valley the paying of 47c. for run-of-mine coal was justified because the slack average in that region made it a fair price. That figure looked good to the union and the miners of the "No. 8" field. Consequently they gave the operators in the Hocking Valley their word that if the operators in other parts of Ohio would immediately resume operation they would not permit the eastern Ohio field to operate unless it would pay 47c. for run-of-mine coal. This agreement was made to effect a break in the operators' ranks. The promise was made despite the fact it was a violation of a former undertaking.

Any such agreement was without justification and extremely dishonorable, but it was also imprudent as it cut all the ground from under the feet of the union, preventing any compromise on price. Thus came the deadlock, which again proved that honesty is the best of policies. It will take many years to compensate the monetary loss of the miners, and what of their moral obliquity? My advice to Ohio coal operators is, in future, stop, stay and start together.

The Canadian Industrial Disputes Investigation Act Shows the Way

To prevent another disastrous affair of this kind, let us hope that some legislator desirous of conserving the assets of the state from waste and its citizens from periodical spells of idleness will in the near future formulate and introduce a bill for a compulsory arbitration board. Such a body is best calculated to deal with just such cases. Every fair-minded miner and operator would give his moral support to such a bill. Whenever a party is unwilling to submit its case to investigation there is something wrong in its position.

The Canadian Industrial Disputes Investigation Act of 1907 governs all matters relating to wage allowances or other remuneration of employees, terms and conditions, etc. The Minister of Labor has general administration of the act. The board consists of three members, one being recommended by the employees and one by the employers, and these two choosing the third. Whenever any dispute exists between any employer and his employees, and the parties thereto are unable to adjust it, either of them may make application to the minister for the appointment of a board. The board must be established within 15 days.

When the creation of the board is requested, a statement is furnished telling who are the parties in the dispute, estimating approximately the number of persons affected or likely to be involved in the controversy and reciting the efforts to adjust the matter which have been made by the parties themselves up to that time. The board has the authority to make all suggestions and to do whatever it deems right to induce the parties to come to an amicable settlement.

The following clause is the important part of the act: "It shall be unlawful for any employer to declare or cause a lockout or any employee to go on strike on account of any dispute prior to or during a reference of such dispute to a board of conciliation and investigation."

A Crime to Fight First and Talk Afterwards

The penalty for a breach of this provision by the operator is not less than $100 and not more than $1000. If the employee violates it, the penalty is not less than $10 nor more than $50 for each day or part of a day that such a lockout or strike exists. The act further states that it shall be an offense for any party to incite, encourage or aid any employer in any manner to declare or continue a lockout or to induce any employee to go or to remain on strike contrary to the provisions of the act. Such an offender shall be liable to a fine of not less than $50 nor more than $1000.

---

Saved Millions of Dollars

This law has prevented the loss of millions of dollars to employers and employees, not only to those engaged in coal mining, but to men in all other industries in the Dominion. Of course, even after all in reason has been done to avoid a stoppage of work, it is possible for one to take place, as happened in Vancouver under the guise of a "vacation," but neither the government nor the public was deceived by such shallow tactics and the strike ended ignominiously for the party unwilling to arbitrate.

Had the "No. 8" field been compelled to present its troubles before such a board, public opinion would have been all on the side of the operators. Why the United States Government has not long ago seen the wisdom of such an act as that established in Canada long ago is a mystery. Such a law could do no harm, and its power to effect good is incalculable. This is an important subject and a good time for Coal Age readers to debate it.

* * *

Protecting the Workmen

By H. M. Wassum*

During the past few years more and more care has been taken by nearly all the bituminous coal companies to prevent accidents in the mines and to reduce their number. No one questions the fact that all operators should make the conditions as safe as possible for the men; and I have generally found that they are anxious and willing to do this. Of course, as in everything else, there are exceptions to this rule, but it is only by the smaller companies, and such cases are soon brought to the attention of the state inspectors.

The mining laws of most states are rigid in regard to this matter, but we find that the operators, especially the larger ones, are not only obeying the laws, but are going farther and taking extra precautions whenever they think them necessary.

While we do not like to place a value in dollars and cents on human lives, we have often wondered if the coal companies are receiving full value for the large sums of money spent for this purpose. Are they spending the money in the best way possible to save the lives of the workmen? In the care and oversight of the men, I think not.

While the number of fatal accidents per million of tons of coal mined has been reduced, this reduction is not in proportion to the larger sums now being expended to this end, and we have reached or soon will reach the limit of expenditure possible for this work. Now the question is, How will we obtain better results? If we saved 100 lives last year, could we not have saved 200 with the same effort?

Most Accidents Due to Carelessness

What is the cause of the greatest number of accidents in the mines today? From the 1913 report for the bituminous region of Pennsylvania we copy the following statement: "Of the 561 lives lost inside the mines, 325, or 57.93 per cent., are attributable to neglect or carelessness on the part of the victims themselves; 11, or 1.96 per cent., to the carelessness of others; 127, or 22.64 per cent., to accidents beyond the control of the victims themselves, and in 93, or 17.47 per cent., the responsibility was not defined."

Accidents Due to Carelessness

Just think! Almost 58 per cent. of the total mine fatalities are due to the carelessness of the victims themselves. True, conditions have changed during the past ten years, but we are hardly taking this change into consideration in our methods of dealing with the question.

Ten or fifteen years ago the miners were as a rule of the English-speaking race. These men considered their work almost a profession and took pride in it. Today, with the majority of miners resident in this country less than five years, we have an entirely different class of people to deal with, and different methods are required. With the old-time miner, if the operator met him half-way in the prevention of dangers, he would do the rest, and there would be no case for the undertaker. The trouble was that the operator did not share his half of the responsibility at that time. But today the coal companies must shoulder almost the entire burden of protection or be responsible for the result.

More men have been continually placed to oversee and direct the work. This to a certain extent is necessary, for the labor is mostly unskilled. But if a man works at the same job for two or more years, and then requires the same amount of attention as when he started, there is something wrong. It is not through ignorance that the men do not protect themselves as they should nor obey the orders given them. It is as a rule their carelessness. The men are working for what they can get out of it with the least amount of labor, and they are born gamblers when it comes to taking chances with their lives.

Men Must Be Trained to Become Miners, Not Laborers

In many mines today there are so many bosses making inspections that the miner—unless something unusual happens—can not get into danger from the time of one inspection to that of another. But the unexpected frequently happens in coal mines, and if we wish to handle this matter efficiently the men must be trained to become *miners* and not *laborers*. They must be shown that they have a responsibility and that they must assume it.

Several large companies have seen the advantages of teaching and instructing the men rather than directing and overseeing them. The men are shown moving pictures in which the right and wrong ways of doing their work are flashed on the screens. Meetings are held in which the men are invited to take part in the discussions of various subjects.

The men have been made to feel that there is something in their work besides hard labor. They are made to see that they are not simply cogs in a wheel, but human beings with some responsibility placed upon them, and they can not help but become better workmen.

I believe that money spent in this way will bring us more returns in the saving of lives than in the way we have been using it. You do not need to watch a good man; he will watch himself.

Modern Appliances in Coke Manufacture

By E. C. Ricks*

SYNOPSIS—The beehive oven is defended on the ground that it is not now so wasteful as in former years, while the modern machines used in the process of making beehive coke have greatly reduced the cost of manufacture. Coke-oven doors are discussed at some length.

During the past few years, so much has appeared in print regarding the superiority of the byproduct and rectangular types of coke ovens that I fear many of us look upon the beehive oven as being very primitive and wasteful. Be that as it may, the fact remains that many thousands of beehive ovens are still in use, and in view of the progress made during the past year or so toward cheapening the cost of producing coke, the idea of consigning the beehive to the ash dump has been pigeonholed by the majority of coke operators.

It is not my intention to take up the merits and demerits of the different types of coke ovens in this article, owing to the limited space allotted, but simply to mention briefly the different machines and appliances used at a modern beehive-oven plant which have enabled the operators of such plants to reduce the labor cost of producing coke to a figure as low as 9c. per ton and even less. This figure represents the total labor cost from the time the coal is deposited in the ovens until the coke is loaded ready for shipment and the coke ashes hauled to the dump. No labor costs are included previous to leveling the coal, since the charging of the ovens, as well as all other costs up to this point, are practically the same regardless of the type of oven. Neither are any labor costs of upkeep included, as such costs must necessarily depend upon the condition and age of the plant, equipment, etc. I appreciate that the upkeep is a very important item, but owing to the fact that such costs at a new plant, equipped with new machinery and appliances, would be less than at an older installation, no reference to such costs will be made in this article, for fear of being misleading.

Starting with the leveling of the coal in the oven, the strictly modern plant utilizes the Covington leveling machine (Fig. 1), the only mechanical leveler for beehive ovens known. This machine, weighing approximately the same as a larry loaded with coal and geared to travel three miles per hour faster than the average larry, can level 25 ovens per hour easily, including shifting, and performs its work as well as can be done by the hand-method and much better than the average hand-leveler.

On a 200-oven per day basis, the net labor saving effected by this machine is around $10 per day, to say nothing of the additional advantage of being able to completely close and seal the oven door immediately after the coke is drawn, which is made possible by using this machine. The advantage of promptly closing the oven door, regardless of when the oven is to be recharged, is apparent in the length of time required for the new charge of coal to ignite.

This conservation of the heat is particularly appreciated when the coal bins are empty and the hoisting of coal delayed by reason of an accident in the mines or from any other cause. This leveling machine passed through the experimental stage years ago and has given satisfaction for some time, one machine having been in constant operation since June, 1909, and several others since 1912 and 1913.

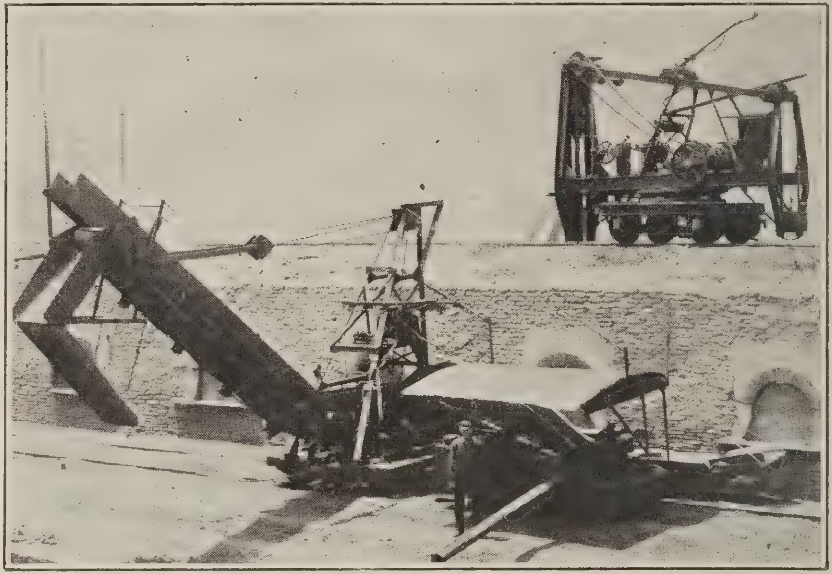

Fig. 1. Leveling Machine in Upper Right-Hand Corner and Coke Drawing and Loading Machine Below

The greatest labor-saver is the coke-drawing machine (Fig. 2), the capacity of which is from four to six ovens per hour, drawn, screened and loaded ready for shipment. So much has appeared in print regarding this machine that a detailed description of the machine and its operation is deemed superfluous. However, so many improvements have been added from time to time, including better designed parts made of better material, etc., that the efficiency of the machine has been greatly increased. The best evidence of the success of the coke machine is the number of repeat orders given the manufacturers by firms that have been using them since 1906. In addition to about six Hebb machines and about the same number of the Stauft design, there are approximately 200 of the Covington coke-drawing machines now in the various coking districts of the United States and Canada, one large coke company in the Connellsville region of Pennsylvania having 82 Covingtons.

As those who use them know, the advantages of the coke-drawing machine are many, as it not only eliminates the labor troubles experienced from time to time by prac-

Mechanical Accessories for Beehive Ovens

Fig. 2—The first electric-driven coke machine built by the Covington Machine Co. and installed at Continental No. 1 plant of the H. C. Frick Coke Co. early in 1906. Fig. 3—An ash car which is used in place of carts for hauling ashes from the coke yard to the dump. It runs on the coke-machine track and holds 6 cu.yd., being drawn by two horses. Fig. 4—Baldwin door-brick conveying truck in use at Continental No. 1 works of the H. C. Frick Coke Co. This saves many brick from breaking by reducing the height of their fall. It will pay for itself in a few months. Fig. 5—Baldwin door-brick conveying truck with the platform in the dumping position. It has just discharged the door brick on the wharf. Fig. 6—In the center is a crane for handling unhinged oven doors, such as those of the Humphrey, McMurray, Auld and McCreary types. The crane is operated entirely by hand. This photograph was taken at the Seabright plant of the Taylor Coal & Coke Co., near Uniontown, Penn. Fig. 7—Lucia door installed at the Phillips works of the H. C. Frick Coke Co. in June, 1911. There have been no repairs whatever at this installation in four years, with the exception of two replacements of tile lining. The saving effected by using this door has averaged about 9c. per oven charge.

tically all operators of hand-drawn plants, but one machine will draw, screen and load as many ovens in a working day as any 20 men in the country can draw in the same time, and the machine will do the job for half the cost of hand-drawing. The machine will also draw easily any size charge it is possible to burn, and it might be well to add that owing to the fact that the machine draws an oven so quickly, allowing the hot oven to be recharged within 30 min. after the drawing begins, a much larger charge can be coked. In the Connellsville region, an average yield of more than five tons of coke from a 12-ft. 3-in. machine-drawn oven is common, while a 13-ft. oven yields as high as 6 tons per charge. A yield of 5 tons from any size hand-drawn oven is extremely good, 4½ to 4¾ tons being an excellent average.

In the Connellsville region, the labor cost in connection with machine leveling and machine drawing will seldom exceed 33½c. per oven, including the entire operation of leveling, watering, bricking and daubing the door and shifting cars. Adding to this the wages of a professional burner who looks after the burning of all ovens, wages of the yard boss, cost of carting ashes to the dump, forking breeze coke from ashes into railroad car, keeping railroad track clean, etc., the total labor cost still does not exceed 42c. per oven. The cost of doing this same work entirely by hand, in the Connellsville region, is seldom less than $1.25 and usually amounts to about $1.35 per oven. Figured on a tonnage basis, the saving effected by machine work is even greater, owing to the greater tonnage as previously noted.

The Improvements Pay for Themselves

As to the ultimate cost of machine work, as compared with the hand method, the net saving effected by the machines, after deducting all proper charges such as interest, depreciation, repairs, power, oil, waste, etc., has in several instances at least paid for the entire installation in from 12 to 14 months, including the labor and material cost of changing oven doors for machine work, as well as the grading of the coke yard and the laying of the machine track.

With the advent of the coke-drawing and coal-leveling machines, the Stauft rotary sprinkler also came into use. This unique contrivance, operated by the force of the water used in quenching the coke, makes it possible for one man to water three to four ovens at a time, doing the work better and cheaper than it can possibly be done in the old way and with less water.

Another improvement is the side-dumping ash car (Fig. 3) which runs on the coke-machine track. The ashes are deposited by the coke-machine conveyor at a point about 3 ft. beyond the outside rail of the coke-machine track, from which point they are shoveled directly into the ash car and hauled to the dump. This ash car holds about 6 cu.yd. and is drawn by two horses hitched tandem.

The Baldwin door-brick conveyor (Figs. 4 and 5) is another great improvement. By using this arrangement, the door brick and mud, instead of falling to the ground in front of the oven door, are deposited on this conveying truck and dumped clear of the coke-machine track. This appliance not only saves the labor cost of forking the brick away from in front of the oven door, but many brick are saved from breakage, owing to the comparatively short distance that the brick fall. The truck weighs about 1300 lb. complete and is easily moved from oven to oven by one-man power. By means of a lever the dumping of the brick from the truck is easily controlled, and this same lever is used to right the empty truck after dumping.

A Satisfactory Coke-Oven Door

Another improvement which is just emerging from the experimental stage, but which bids fair to fill a long-felt want, is a satisfactory coke-oven door. Numerous doors have been tried out in years gone by and found wanting, but the experience derived from these earlier attempts has been valuable, and from now on we may expect to see a vast number of coke-oven doors installed, not only at machine-drawn plants, but at hand plants as well. The brick firms who have reaped such a harvest in the past from the sale of door "cubes" will be called upon to furnish tile lining for doors, unless the asbestos-bound plastic clay lining invented by an enterprising Pennsylvania chemist by the name of Campbell is found preferable to the tile.

The science of coke making has reached the point where a well-burnt charge of the highest quality coke is not all that is expected. The modern coke maker insists upon uniform charging, leveling and burning, as the result of long experience, but in addition his slogan is, "Increase the yield," and in order to do this all unnecessary air must be excluded from the oven. Surplus air means surplus ashes, which spells loss; therefore this surplus air must be excluded, and the coke-oven door is expected to deliver the goods.

Among the doors recently tried out are the Humphrey, McMurray, Auld and McCreary types, all four of these being unhinged doors which, when in place, rest on the sill plate of the door opening and are prevented from falling out partly by the inclination of the top of the door toward the oven and in some cases by a pin inserted in each side of the door frame. To remove this type of door in some cases a crane (Fig. 6, center) mounted on a truck which runs on the coke-machine track is used, the crane depositing the door on a "roost" which is embedded in the oven wall alongside the door opening (Fig. 6, right). When on this "roost," the lining of the door is toward the oven wall and rests against it. Where the crane is not employed, a rail is secured to the oven wall, well above the door arch, on which rail a trolley is suspended, to the lower end of which a short lever provided with a hook is attached. To remove the door with this arrangement, a workman inserts the hook in the proper receptacle on the door, and by pulling down on the lever the door is released and the trolley conveys it clear of the door opening, after which the door either remains suspended or else is deposited on the "roost."

The only hinged door that so far has lived through the experimental stage is the Lucia, manufactured by the Covington Machine Co., of Covington, Va., which firm makes the Covington coke drawer and the Covington leveler. The Lucia door consists of two sections and is hinged in a frame, both sections being hinged on the same side. The ingenious method of hinging this door, together with the manner in which the frame is securely anchored in the oven wall, has overcome the objections to hinged doors of past experience. One of these doors (Fig. 7) was installed in June, 1911, and today appears to be as rigidly mounted and as easy to open and close as the day it was installed.

To operate this Lucia door, all that is necessary is to engage the ring attached to each section and swing it open or shut in the same manner that any other hinged door is operated. This door is made in two sections so that the top section may be left open until the coal is leveled by hand. Where the leveling machine is used exclusively, the door need only be in one section, as the coal is then leveled, not from the door, but from the trunnel head.

Of the doors mentioned the Lucia is designed for either tile or plastic lining, the Auld and McMurray for plastic lining only and the Humphrey and McCreary for tile only. The plastic-lined doors are all made with solid fronts with projecting attachments on the inside for holding the lining in place. Some of the tile-lined doors are solid also, while others are made skeleton in order to reduce the weight.

At this time it would be hard to predict which of these several types of doors will prove the greater commercial success, although the Lucia door seems to conform nearer to safety-first principles and its operation appears more simple. However, suffice it to say that the coke-oven door has come to stay, many of them having already been installed and giving good results, and I predict that before the close of the next two or three years practically every beehive oven in the United States will have been equipped with a door of some description, regardless of whether or not the ovens are drawn by machinery.

⁂

Extracts from a Superintendent's Diary

It might be possible for a mine superintendent to direct an entire mine operation without ever leaving his office during business hours, and occasionally I have found myself attempting that very trick; but there is one thing that it is not possible to do under such a scheme of management and that is to give the feelings of the employees intelligent consideration. For several weeks now, because of a sprained back, I have been unable to travel except by means of a rolling chair, so I have been compelled to run things from the office, and I know exactly what absolute office management would mean, in my case at least.

Today when I discarded the bandages and the rolling chair and ventured forth to hobnob a little with the men, it all came to me suddenly—the realization of how completely I had lost sight of the human factor during the "brown studies" I had indulged in while confined to the office.

It so happened that on the day after I met with my accident the cost sheets of the previous month's operation were received from our auditor's office, and I immediately got busy and examined them carefully—more carefully, in fact, than I had ever done before. Nor did I stop with one examination, but got them out again and again day after day and dug into the whys and the wherefores of every item over and over again. Naturally I began to form certain conclusions and unconsciously decided upon many radical changes that I hoped would correct all of the apparent inconsistencies.

Shut up in the office with only the cold figures before me, it looked so easy and reasonable, this rearranging and consolidating of tasks to make possible the readjustment. But today with the men themselves standing before me it was an entirely different proposition.

Some of the jobs that I proposed to abolish were filled by married men having large families to support, and a few of these families had been born and reared in our camp and the fathers had been considered faithful employees always. Other changes were to affect sons who were supporting widowed mothers, whose husbands had been killed while in the discharge of their duties and in the employ of our company. And there were several newly-weds who were to suffer by the rearrangement, that had been led to believe that they might expect better positions because of their new obligations. I have never argued that it is possible for two to live comfortably on the earnings previously required by one; on the contrary, I have felt that men who annexed sweethearts should be raised to better positions at the first opportunity.

This made it clear that I should have to begin all over again, keeping in mind this time my responsibilities to the men as well as the better dividends I would like to earn for my company.

It is so easy for outsiders to suggest that corporations are not charitable organizations, nor can they be expected to give thought to the domestic affairs of their employees, and it is also easy to remark that corporations are without souls. But taking my own experience of today as typical, I'll have to take issue with the next one of my friends who makes such a statement and assure him that so long as corporations are run by average everyday citizens like myself the same average citizens can hardly be expected to act always as if they were without souls.

⁂

Texas Has Good Coal Output

The amount of coal produced in Texas in 1914 was 2,323,773 short tons, valued at the mines at $3,922,459.

The coal production of the state is nearly evenly divided between lignite and bituminous coal, the balance being slightly in favor of the bituminous. With the exception of the production in 1913, the production in 1914 was the largest on record, according to figures compiled by C. E. Lesher, of the U. S. Geological Survey.

The total production in 1914 was less than in 1913 by 105,371 tons, or 4.34 per cent., in quantity and $366,461, or 8.54 per cent., in value. Most of the decrease in tonnage was in the lignite output, which in 1914 was 1,105,613 tons and in 1913 was 1,181,156 tons, a difference of 75,543 tons, whereas the output of bituminous coal—1,218,160 tons in 1914 and 1,247,988 tons in 1913—decreased but 29,828 tons. In value, however, the bituminous coal decreased much more than the lignite.

The coal mines of Texas were not entirely free from labor troubles in 1914, as 220 men were on strike during the year with an average of three days each of lost time.

Most of the lignite produced in Texas is mined by hand, and of the bituminous coal produced nearly one-half is shot off the solid. The use of mining machines has not made much progress in the state, and those that are employed are in the bituminous mines. The quantity of coal shot off the solid in 1914 was 612,158 tons, or 26 per cent. of the total.

Washing plants have been installed at the mines at Eagle Pass in order to improve the quality of coal sent to market. In 1914 the quantity of coal washed was 23,604 tons, which yielded 19,440 tons of cleaned coal.

⁂

Use of Private Spur Tracks—When a railway company has constructed a spur track to serve a private coalyard, a lessee of the yard is entitled to shipping service on that track. The company's refusal to deliver shipments from persons or locations not served by its line constitutes actionable unjust discrimination. (Texas Court of Civil Appeals, Seeger vs. M., K. & T. Ry. Co., 175 Southwestern Reporter 713.)

Modern Coke-Handling Methods

By F. V. Hetzel*

SYNOPSIS—The manufacture of coke will doubtless increase in this country somewhat as it has in Germany. On account of its bulky character and the fact that breeze has a decided tendency to adhere to larger pieces, proper methods of cleaning and handling domestic coke deserve careful attention if a suitable market is to be secured and maintained.

Various technical journals and daily newspapers have referred to the present extraordinary production of by-product coke in Germany as a result of the great activity there in the manufacture of benzol and ammonium sulphate. In fact the situation is that ovens are operated chiefly for the recovery of these chemical products and the coke is produced in quantities so much greater than the normal consumption that railroads and other consumers of fuel have been directed by the government authorities to use a certain proportion of coke with their coal.

While we have not come to such a pass in this country, it is certain that the use of coke for metallurgic and domestic purposes will increase greatly within a short time and producers of it will give more attention to the preparation of their product, to the demands of the market and also to means for pushing the sale of coke where coal is now used.

In dealing with the domestic trade it is important to clean coke from the adhering breeze. Several coke producers in western Pennsylvania have built crushing and screening plants, some with overhead bins, to do this work. These were described in Coal Age of June 7, 1913, p. 876, and may be taken as representing the most advanced practice. There are, however, many places where it is not convenient to store coke in bins, especially in connection with gas works, where the daily sales of coke do not always keep pace with the production. Here the production is fixed by the output of gas that is required of the works.

In such cases large amounts of coke are often stored in the open, and means must be provided to get it from

---

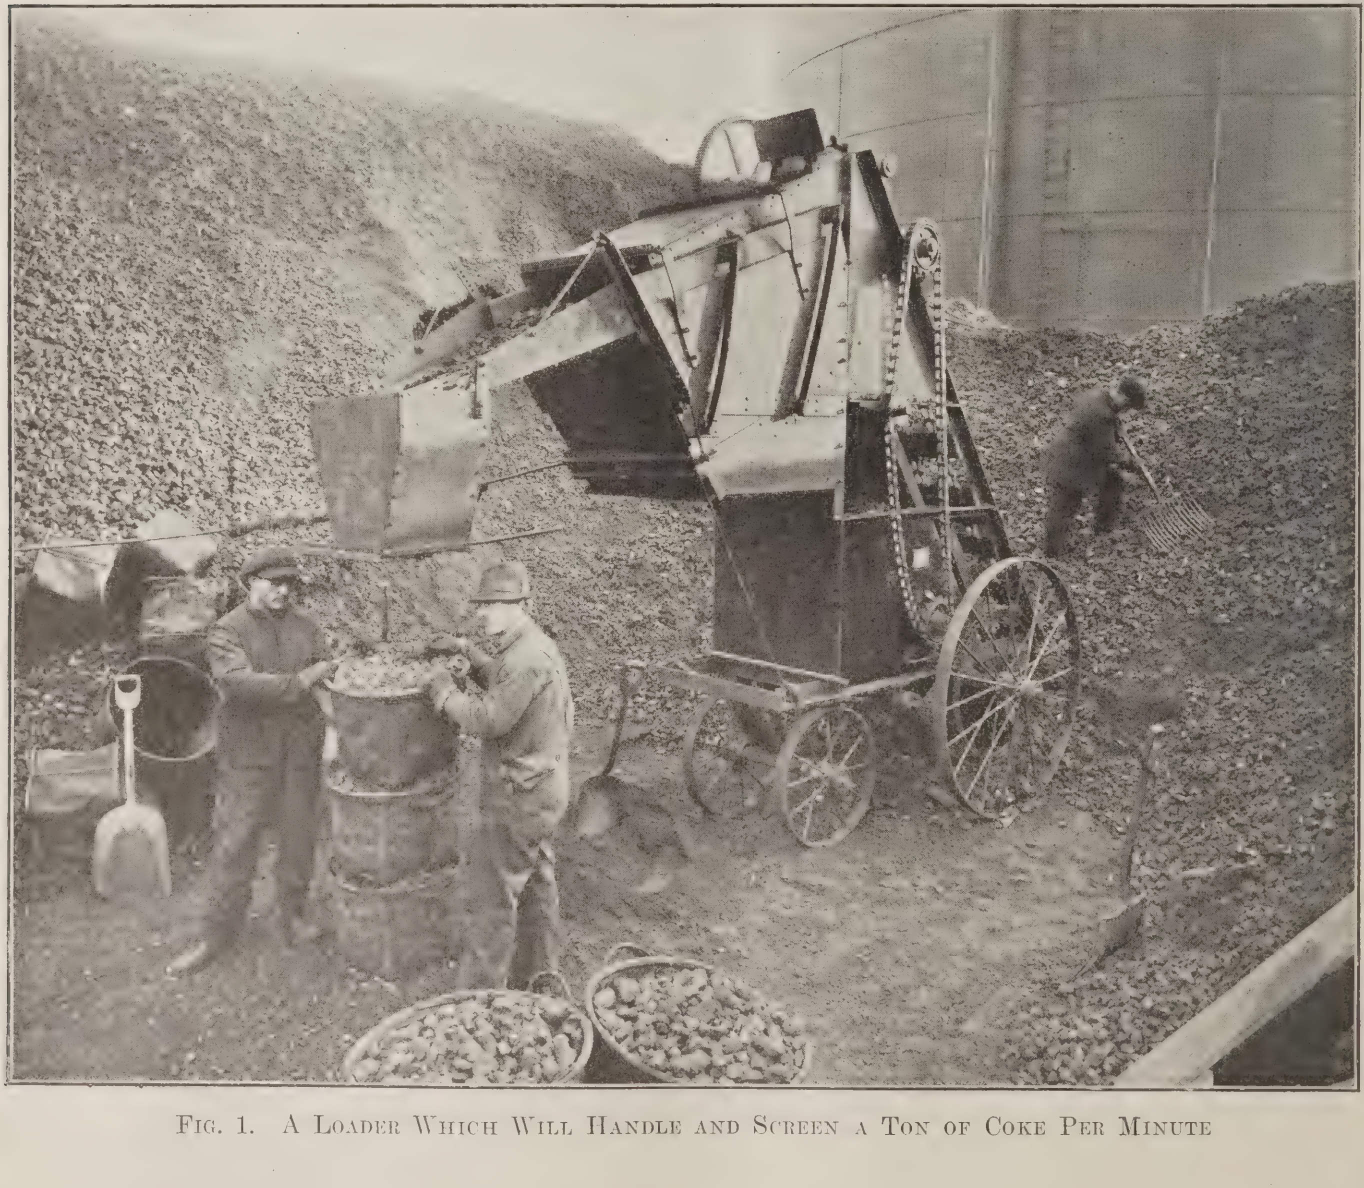

Fig. 1. A Loader Which Will Handle and Screen a Ton of Coke Per Minute

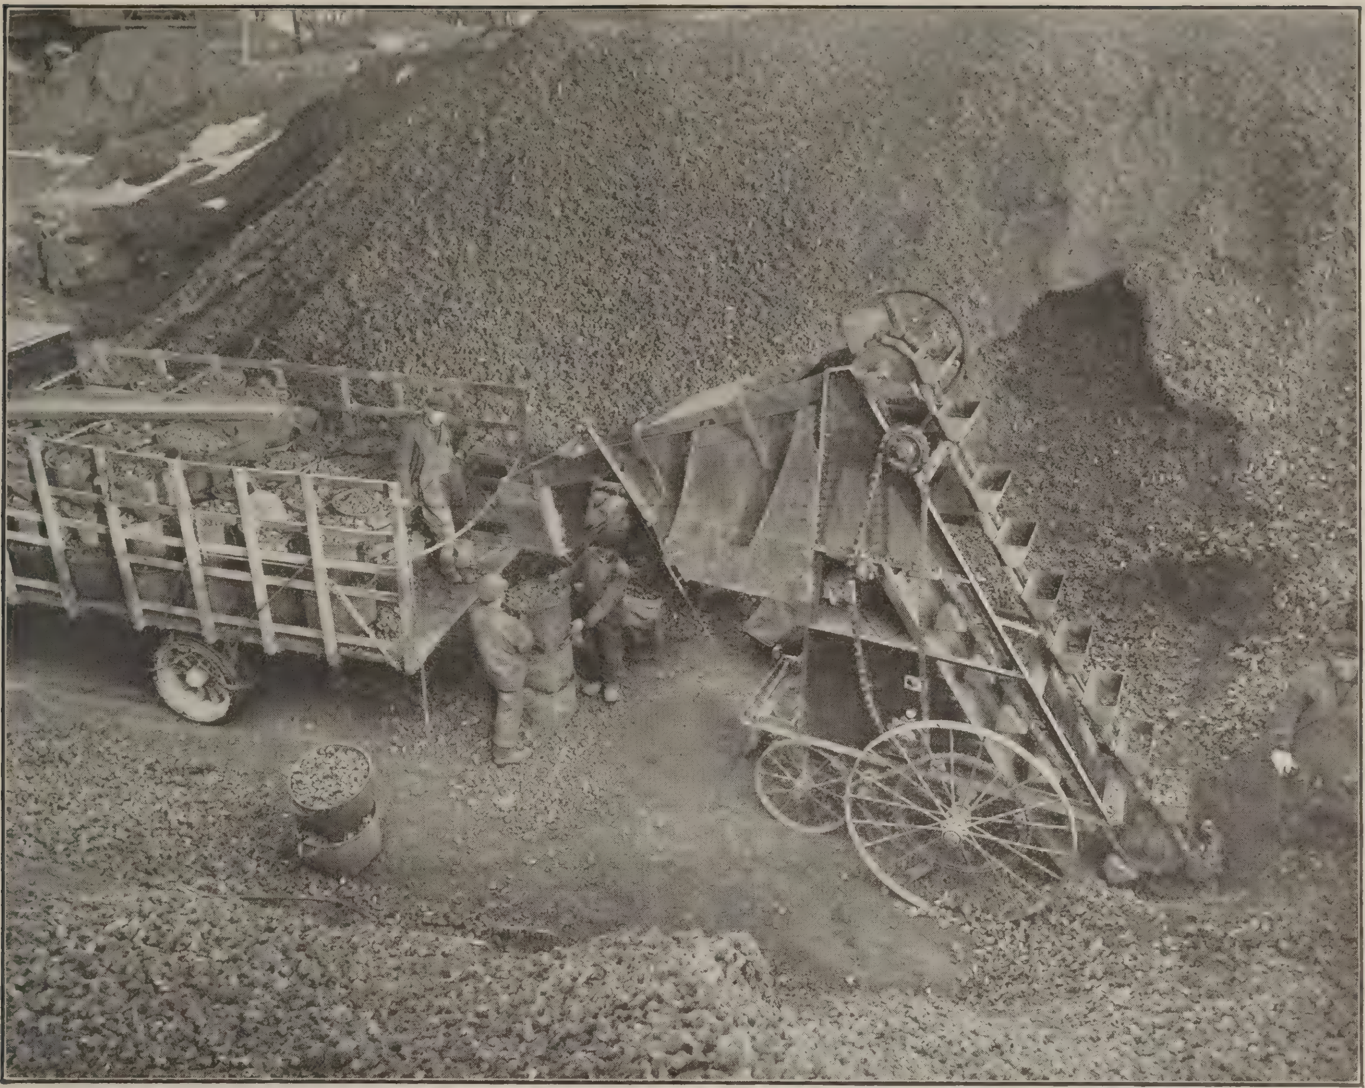

FIG. 2. A SMALLER MACHINE FITTED WITH A BAGGING HOPPER

the ground into wagons or motor trucks. Wagon-loaders are particularly useful for handling gas-house coke because they can be arranged to screen the product as it is delivered. Furthermore, with high wagons and motor trucks it is a hard job to throw coke with forks to the required height.

Another point is that a surprising amount of breeze or fines sticks to coke stored in the open. This cannot be removed by forking. In the domestic sizes the proportion of this breeze often runs as high as 10 per cent., and it needs considerable shaking to get the breeze loose.

To screen coke properly and at the same time avoid breaking it, loaders are now made with shaking screens arranged so as to receive the coke with a short fall from the buckets as they pass around the head wheel and deliver it with a short drop into the trucks. On account of the bulky nature of the product large buckets are necessary to give an ordinary capacity of a ton in one or two minutes, and to insure durability against the grit the chains are often fitted with hardened pins and bushings.

Fig. 1 shows a large loader which has a capacity of one ton a minute and which is fitted with a hopper for screenings. A 7½-hp. motor furnishes the power, and the machine is sometimes made to propel itself. Fig. 2 shows a smaller machine fitted with a bagging hopper, which holds a little more than one bagful of coke.

This machine is used in connection with a large open storage plant, and since its installation it has displaced five men who formerly did the work with forks. Furthermore it delivers coke that is really clean. It does the work more quickly, and when used for loading motor trucks it makes the latter a profitable investment by detaining them in the yard a shorter time and allowing them to be out on the street on delivery service more than formerly. In the yard shown four tons of coke are screened, bagged and loaded in 15 minutes.

On account of the light weight and great bulk of coke, a bin to hold some hundreds of tons becomes quite large and if well-built is comparatively expensive. Storing in the open or under sheds is much cheaper, but the expense of reclaiming and reloading the coke from the ground by forking and screening has in the past been the great objection to such methods.

With the use of the screening loader most of this expense is avoided and the coke can be loaded more quickly and screened much better. As a consequence the cheaper plan of storing coke on the ground has been adopted by a number of coke plants in preference to building bins for storing it overhead.

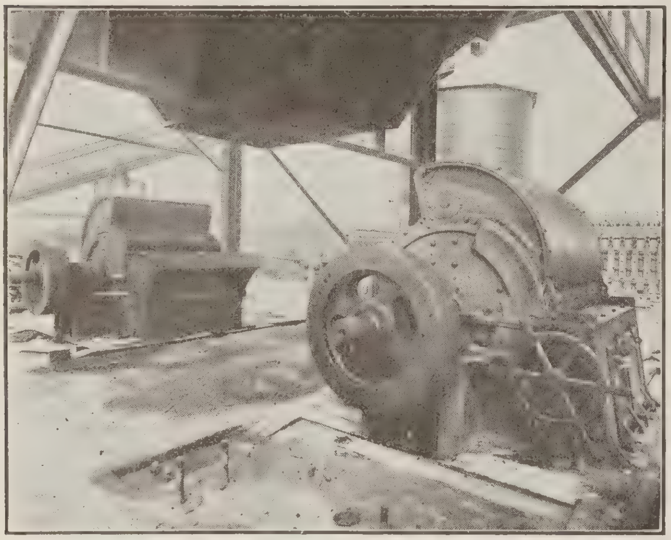
Crushers for Byproduct Ovens

M. J. Williams*

SYNOPSIS—A description of two of the largest machines ever built to crush coking coal through a $\frac{1}{8}$-in. mesh screen. These crushers weigh about 15 tons each and have an hourly capacity of 250 to 300 tons.

The accompanying illustration shows two No. 8 Williams patent jumbo coal crushers installed in the byproduct coke plant of the Minnesota Steel Co., at New Duluth, Minn.

These crushers are intended to pulverize bituminous coal for byproduct coke ovens. The coal is delivered to the storage bin above the crushers in $1\frac{1}{2}$-in. cubes and finer, being broken to this size by Heyl & Patterson Bradford breakers. From the storage bin it passes by gravity to the two crushers, where it is pulverized and ground to a product 90 per cent. of which will pass a $\frac{1}{8}$-in. mesh screen.



Jumbo Crushers for Coal and Coke

These two machines are mechanically interesting for a number of reasons:

1. They are the largest size crushers ever built for reducing coal to $\frac{1}{8}$ in. and finer. They will each be direct connected to motors of approximately 350 hp., operating at a speed of 750 r.p.m. The flexible couplings used to make this connection are of the Baehr type, capable of transmitting from 500 to 600 hp. The use of flexible coupling relieves the motor of any shock or stress caused by intermittent loads. It also does away entirely with belts, makes the installation compact and is the most efficient drive possible for crushers of this character.

2. Each crusher is equipped with a metal trap or arrester, so arranged that a large percentage of stray or tramp iron which may pass the magnets located between the storage bin and the crusher is trapped and can be removed at any time without injury to the internal parts of the crusher. These metal arresters are in successful operation on many crushers of this type and never fail to do the work. They are practically fool-proof.

3. Each crusher is equipped with an $8\frac{15}{16}$-in. shaft, which runs in self-oiling dynamo bearings. These are dust-proof, self-lubricating and remain clean and cool at all times.

4. Each crusher is equipped with cast-steel disks carrying the hammers, with a series of six adjusting holes. These permit the operator to "let out" these hammers as they become worn, $\frac{1}{2}$ in. at a time until 3 in. is worn off the hammer end. This amount of wear ends the usefulness of the hammer. With this adjustment all the available stock in a crushing hammer may be used.

5. Each crusher is equipped with an adjustable breaker-plate and front end. The operator may adjust this plate in toward the revolving hammer from $\frac{1}{32}$ in. up to 2 in., or any distance desired between these limits. Such an adjustment may be made while the machine is in operation.

6. Each crusher is fitted with a Williams adjustable dumping cage, which may be adjusted up toward the hammer any distance desired to compensate for wear, while the entire cage may be dropped or dumped into the discharge chute under the machine at any time. Dropping this cage relieves the crusher from uncrushed coal in the event of a fuse blowing. The failure of a fuse would stop the crusher, and unless the feed to it is cut off simultaneously with the stoppage (which can never be done), the machine will load up with uncrushed coal and cannot be started again until this is removed.

To clean out a crusher under ordinary conditions requires opening the machine and working the coal out by hand. This takes from one to three hours, depending upon the men and the conditions under which they are working. With the Williams dumping cage, however, when such a choke-up occurs, the operator merely releases a pawl engaging a ratchet wheel which is placed outside the crusher, and the entire cage by its own weight drops and discharges all the uncrushed coal through a bypass chute. The turning of a handwheel then raises the cage to its proper position, and the machine is again ready for operation.

The dumping cage is fitted into a cast-steel sub-frame, hinged or pivoted at the front of the crusher. The rear end of this frame is fitted with special steel chains which engage sprockets on a countershaft, the actuating mechanism of which is spur gears and a substantial pilot wheel on the outside of the crusher. The ratio of the gears is such that one man may easily raise the cage to its normal position. The operation of discharging the contents of the crusher, as described, and of bringing the cage back to its proper place is the work of from two to three minutes for an experienced operator. This operation may be made necessary, not only by the blowing of a fuse, but may result from any other stoppage cause.

7. Each crusher is built up in sectional construction, and although each machine weighs 15 to 16 tons, any part may be replaced at any time without disturbing the rest of the crusher, the heaviest individual part not weighing over 1500 lb. It is readily apparent, therefore,

---

*Williams Patent Crusher & Pulverizer Co., Old Colony Building, Chicago, Ill.

that replacements are easy and that the cost of any individual part is comparatively small.

The general construction of these crushers presents some interesting features, such as large doors at the back and front of the machine by which from two to three men may freely enter the chute under the crusher and not be crowded. The hopper opening into each crusher is 2x5 ft. Each machine will easily handlle from 250 to 300 tons of coal per hour, crushing it to a product 90 per cent. of which will go through a ⅛-in. mesh screen.

These crushers are approximately 13 ft. long over all, 11 ft. wide and 6 ft. high. They are set upon steel I-beams embedded in a large concrete foundation at an elevation of approximately 15 ft. from the track or ground level.

Improving the Beehive Output

By H. S. Geismer*

SYNOPSIS—Byproduct ovens possess many advantages over those of the beehive type. To offset these advantages and to produce a product that can compete in the market with byproduct coke great care and attention to minute details are necessary in the manipulation of the beehive oven.

There are in the United States today a large number of idle batteries of beehive coke ovens, and some of the owners are beginning to wonder if they will ever be able to put them in blast again. In some instances their worst fears are well-founded. Because of the present high prices on all coke-oven byproducts there are practically no idle by-product ovens in the country, and in consequence the sale of byproduct coke is being pushed, and a goodly number of foundries and furnaces are using this fuel almost exclusively, or at any rate in larger proportion than ever before.

Whether they will ever go back to beehive coke (assuming of course that they can always obtain a sufficient supply of the byproduct variety) will depend on the results they obtain with the byproduct coke now being furnished. If their former coke supply was obtained from a beehive-oven operation that produced a coke of variable quality—and there have been only too many such operations in the past—it stands to reason that they have learned now what uniform quality in one's coke supply really means, and they will go back to beehive coke under protest, since any byproduct plant furnished with a uniform quality of coal can be depended upon to produce an equally uniform quality of coke. If, however, the results obtained from the two varieties of fuel show little variation, the question of returning to beehive coke will depend largely upon the future selling price of the two grades.

Some half-dozen years ago in taking charge of a group of mines and furnaces I found myself called upon to decide between the possibility of improving the quality and cutting the cost of the beehive coke produced at one of the operations or abandoning that operation. The investigation that resulted was similar to the inquiries that will have to be carried on at many existing beehive-oven plants if they are to successfully compete with byproduct ovens now reaching out for business in their territory. A short account, therefore, of what was accomplished and how it was accomplished may prove of interest.

No originality is claimed for the method used nor for that matter is any great originality required with most efficiency tests. It is largely a question of arousing the interest of the management to a point where it will pry into the details.

Cost Sheets were first Studied

First, a careful study of the cost sheets of the previous management was made, from which it at once became evident that the high cost of coke was due principally to the low yield from the ovens, 50 per cent. being the average. Careful analyses of the coal used threw no light on this low yield.

Next, inquiry was made at the furnace where the coke had been consumed to find out if possible why this fuel had been given such a bad name. The result of this inquiry showed that the ash content of the coke, as delivered at the furnace, was exceedingly variable, and as a result the furnace worked irregularly when burdened entirely with it. Careful analyses of the ash derived from the coke showed that it ran high in alumina, and this probably aggravated the irregular working of the furnace, when the percentage of ash in the coke was excessive or above what would be expected from average coke of high variable ash content.

This variable ash content indicated a lack of proper supervision in operating the ovens or in the preparation of the coal or a combination of both. Thus all of the evidence obtainable from the records indicated that mismanagement at the ovens might be responsible for the poor showing that had been made by the operation.

The investigation was now carried direct to the ovens, and close inspection was made of every step in the operation from the time the coal was loaded into larries for the ovens until the finished coke was forked into railroad cars. It became evident at once that a number of circumstances contributed to the low yield of coke.

The coal used was washed before being sent to the ovens, and as the bin capacity at the washer was small it often happened that the coal was taken from the bins before the water had time to drain out. When this happened the larries might contain as much water as coal, and the oven bottoms were consequently flooded and chilled. As a result these ovens were slow to flame and they did not burn in on time.

If the coke puller who was in charge of the particular oven that had failed to burn in on time got impatient, he might punch a few holes in the oven door to hasten its burning in. This necessarily meant that a considerable quantity of coke would be burned up in the oven before being pulled. Not satisfied with this, the puller would often pull the oven before coking was complete, occasioning further loss as well as a poor quality of coke.

---

*Keiser-Geismer Engineering Co., Birmingham, Ala.

Labor was scarce, and if a puller was reprimanded too severely for pulling an oven before it was burned in, he might walk off without pulling the oven, and the chances were that it might have to stand anywhere from three to six hours before it could be pulled.

THE WEIGHT OF COAL CHARGED VARIED

Another direct result of the variable water content of the washed coal was a considerable variation in the actual weight of coal in each of the larry charges. This meant that the ovens could not be depended upon to deliver the same quantity of coke from each charge nor could they be depended upon to burn in at regular intervals.

Again it was found that the man in charge of the larry stood in with some of the coke pullers and would put small charges in their ovens, thus relieving them of some of their labor without reducing their earnings, as they were paid by the oven and not on a tonnage basis. Ovens with these light charges often burned in before the pullers reported for work, and if not properly drafted they burned up part of their charge.

It took several weeks of close supervision to inaugurate a system which insured uniform oven charges and a fixed coking time for each charge, but when these were obtained the output per oven per day became a dependable quantity.

Only one condition that contributed to the low oven yield was beyond the control of the coke-oven management—the coal as delivered to the oven contained a considerable quantity of "mother coal." It was found that this "mother coal" produced a coke that was very friable, and a good deal of it was broken up into breeze while being handled on the yard. Because the blast-furnace management regularly raised a howl about the importance of screening out more of the fine stuff, which howl was often well-justified, the coke loaders were cautioned to fork the coke carefully on the yard. In doing this, they broke up a considerable quantity of the friable coke, and this also had its effect on keeping down the yield from the ovens. This trouble was later largely overcome by adopting strict dockage rules at the mines governing the loading of "mother coal."

WHAT WOULD BE THE RESULT OF CAREFUL MANIPULATION

A test was next decided upon to prove just what the ovens could be expected to do if properly handled. Ten ovens were chosen, and for a ten-day period they were given close personal supervision. Each larry was carefully inspected before being discharged to see that it had the exact amount of coal and also that the moisture content was not excessive. The drafting as well as the time of charging and drawing was given the closest attention, and each charge of coke before being loaded into railroad cars was carefully weighed.

It was found that these ovens gave a uniform yield of 59½ per cent. of good quality coke, after screening out all the fines that any reasonable blast-furnace manager could class as breeze.

Profiting by the experience gained with the test ovens, rigid rules were adopted for the entire battery, and the results were most astonishing. The yield of coke from the ovens, taking railroad weights as the basis, jumped up to 57½ per cent. The ash content of the coke was also reduced considerably and remained fairly uniform.

The net result was that the cost of the coke was brought down to where it could be put on a competitive basis with the most favored ovens in the district, and the quality became such that it could be used in blast furnaces without the uncertain result that had previously so often upset the management. Not only that, but the total quantity of coke produced by the ovens began to increase considerably, and after reaching the maximum remained practically uniform while previously it had varied greatly.

The most gratifying feature, however, to all who took part in the test was that all of the improvement had been brought about without making any changes in the ovens or in the oven equipment. Neither were any material changes made in the working force.

The total cost of coke at any beehive-oven operation is dependent upon so many apparently insignificant details that it is difficult to make the man in charge of the mines realize the importance of carefully digging into all of them. Nevertheless it is only at plants where all of the details are carefully inquired into that satisfactory cost sheets can be found. And furthermore, strange though it may seem, in most cases the best quality of coke is secured when the coke-oven cost is reduced to a minimum.

⁂

Coke-Oven Accidents

The United States Bureau of Mines will soon issue its first report detailing the coke-oven accidents in the United States during 1913 and 1914, as compiled by Albert H. Fay, mining engineer. The investigation includes the returns from 275 active plants in 1913 and 253 in 1914 and shows that 96 men were killed, 644 seriously injured and 4059 slightly injured. These plants employed 24,345 men in 1913 and 22,313 men in 1914. The death rate for each 1000 employed was 1.89 in 1913 and 2.02 in 1914.

Mr. Fay says: "The number of coke establishments in 1913 was 551, with a total of 102,650 ovens. The bureau's report embraces 82 per cent. of the ovens. A number of the plants operated only a portion of their ovens, so that the total number idle includes more ovens than are represented by only the idle plants. While the accident figures collected are not complete for the entire industry, yet they are sufficiently representative to point out some of the hazards of this class of work. No distinction has been made concerning the type of ovens in use.

"The figures show that 37 per cent. of the fatalities resulted from accidents caused by cars, larries and motors; 11 per cent. was due to coke-drawing machines, and a like percentage to electricity and falls of persons. Of the fatal injuries 21.5 per cent. was due to haulage systems and 24.1 per cent. to falls of persons. Of the slight injuries 8.3 per cent. was due to haulage systems, 12.2 per cent. to falls of persons, 14.6 per cent. to hand tools and 14.9 per cent. to burns.

"Since 37 per cent. of the fatalities at coke ovens is due to haulage systems, greater care and precaution should be taken to safeguard employees who operate or work near transportation equipment. Inasmuch as electric haulage is used extensively, a large percentage of the electrical accidents may also be classified with those resulting from haulage systems, or over 40 per cent. of all the fatalities. It is in this department of the coke industry that there appears to be an excellent field for the reduction of accidents.

Coke as a Domestic Fuel

SYNOPSIS—It is pointed out that the markets for coke could be greatly enlarged if the manufacturers of this product would conduct an intelligent educational campaign. Coke is the logical competitor of anthracite since it possesses many of the advantages of the latter fuel.

While coke is used as a domestic fuel, it is only to a very limited extent. The object of this article is to impress upon the manufacturer of coke the golden opportunity that awaits his product as a real competitor in the domestic anthracite market.

Coke has all the advantages of anthracite, and in addition several that the latter does not possess—greater cleanliness, uniformity of quality and, lastly, cheapness when price and results are considered.

Years ago coke as a domestic fuel was condemned on the score that it burned the grates. Of course it did, for the only coke known to commerce at that time was the hard, silvery 72-hr. coke. This is the coke that has driven anthracite from its position of being the chief means of smelting ores, until now practically no anthracite is used for that purpose. Furnace coke was only intended for this one purpose, that of creating intense heat, and when tried as a domestic fuel it isn't any wonder that it ruined stoves.

Times have changed and the fuel business also, and now with the introduction of the byproduct coke oven we are getting a fairly satisfactory coke for domestic use, but even now the market for such coke has been merely touched. Much of the original prejudice against coke still persists and must be swept away before any real progress can be made. Fortunately there is a way for those with an open mind.

Coke the Poor Man's Fuel

At this time coke occupies the position of the poor man's fuel—the fuel for him who can spend but 5 or 10c. at a time. Yet while it is the poor man's fuel, the user nevertheless is getting more for his money and is at the same time enjoying a luxury somewhat akin to that of our colored brethren who for years were the chief consumers of bacon, until their white brothers awakened and by improved methods of preparation and exploitation on the part of the big packing companies, boosted the price 10 to 15 times what it was formerly.

While no one can expect such an increased price in coke, the only desire being to find a wider market, yet a lesson can be taken from the bacon story in encouraging coke manufacturers to give the needed attention in the way of adapting coke preparation to meet all conditions, together with a proper exploitation of its virtues as a fuel.

Being entirely a manufactured product the preparation of coke is in the hands of the maker and should not be the result of chance. In a way the use of coke for a domestic fuel was almost as much an accident as was the first use of anthracite. The first acquaintance the public had with it as a domestic fuel was brought about by the gas companies about 40 years ago. In making their gas they produced as a byproduct a 4-hr. coke and this was sold cheaply to a limited trade at a very low price to get rid of it. Yet even this coke fully met all the requirements of an ideal domestic fuel.

Coke vs. Anthracite

To those in the Eastern States who have had an opportunity to compare the two fuels, coke and anthracite, in actual burning tests in ordinary domestic use, there is not the least doubt that coke not only does as much but more than anthracite. However, only a comparatively few realize this, and it is up to the manufacturer of coke to create his market, along lines similar in a way to those by which the manufacturers of gas created one for their product, which developed from a mere illuminant until now it is an active and extensive competitor of all domestic fuels.

For years the anthracite producers have been allowing the gas companies to take their market from them—not that the anthracite tonnage has not increased, for it has, but not in proportion to the growth of population. As the result of this lack of real activity on the part of the anthracite interests the hard-coal trade has been put on its back helpless for four months of every year.

There is not a bit of doubt that much of this trade could have been held by the coal companies had they made any effort at all. As an illustration of the loss of trade it is interesting here to mention the experience in one town. The community in question is 70 miles from the anthracite region and of the 5000 homes there contained, over 1000 did not even have a gas range in them. This is not an isolated instance, for similar conditions may be found in any important community. In the community referred to, besides losing the summer tonnage, the winter demand for anthracite has gone as well, and 90 per cent of it was lost because no effort was made to keep it. The remarkable thing is that all this has taken place despite the fact that gas never was nor ever will be as cheap as coal. The gas companies are simply making the most of their opportunities by dwelling on the favorable aspects of their product and continuously hammering away.

This case is only recited here to prove to the coke manufacturer that, with all the favorable qualities possessed by his product, there must surely be a wide market for it, but it is going to take more than merely saying coke is better than anthracite—he must prove it to the people he wishes to reach; and here in small compass is one man's idea as to how a start can be made.

How to Popularize Coke

Know your product. Being a manufactured substance its quality so far as uniformity is concerned is within your control. It is also absolutely necessary to know what your fuel can do under all conditions. For instance, does a 4-hr. coke meet all the requirements of an ordinary heating stove? Is a different kind required for the cook stove? What size acts best in each? How about the results in steam-heating plants? Will the same kind and size of coke as used in ordinary stoves do for steam, hot-air, or vapor heating plants? It is not at all likely that it will, but it is your business to know. You should know exactly what your fuel will do, and after all of these factors are determined you are prepared to go intelligently after your market.

In seeking an outlet select the most progressive dealer you can find in a town. It goes without argument, of course, that you must make your proposition attractive to him, but you will find he will meet you more than half way if he finds you are responsible and in earnest. Then have your people thoroughly instruct him as to the method of firing the different stoves and heating systems so he can educate his customers. Better still, establish an exhibition plant on a main thoroughfare, with various stoves in operation and show the public the advantages of coke by actual demonstration, which, together with judicious advertising, will prove to them what they are missing in not using the best fuel obtainable.

Of course you will say this is an expensive proceeding. Without a doubt it is. So was the process of the gas companies in educating the public to their way of thinking. Every one knows how the gas companies simply lingered along for years until a man with a new idea came forth.

To a much lesser degree the coke industry as a factor in the domestic market must blaze its path. Then only will it get a full measure of the domestic trade that inherently belongs to it.

That it pays to spend money to make money has had no better demonstration than the experience of the selfsame gas companies as proven by their earnings today. As much or more in proportion can be done for the coke industry if the producing interests really want a share of the domestic coal trade of the East, which amounts to about 70,000,000 tons yearly. It rests entirely with them and the proportion they get will be determined largely by the fact of how much they want the business.

Need of Competent Chemists

With the establishment and rapid growth of the byproduct coking industry in the United States, there comes the necessity of having competent men to carry on researches into the problems associated with the carbonization of coal.

Participants in this particular branch of industry will sooner or later be confronted by economic problems in the production and quality of their output which will require solution through efficient chemical and physical research at the hands of technically trained men. In other words, conditions will soon require more than the ordinary plant routine tests now mostly carried on by laboratory boys and men, some of whom have little if any chemical training.

The raw coal must be thoroughly investigated so as to determine which particular grade or mixture gives the greatest yield of byproducts. The process of carbonization itself must be intelligently studied from a scientific standpoint, getting away from the rule-of-thumb methods of dumping the coal into the ovens and trusting to luck for results. The treatment of the byproducts requires scientific skill so as to bring out the greatest yield of ammonia, tar, gas, etc., per net ton of coal. To improve the regulation and mechanical parts of the processes is also within the sphere of the chemist.

A Field for Study

The abstraction of benzol and its derivatives from the coke-oven gases will also afford a field for much study in the future, and if this country is to compete with others along these lines money must be appropriated and spent in scientific study and investigation for the advancement of this industry. American carbonizers have been slow to grasp this idea of chemical research, while the few that have lent an ear to it have not had the patience to wait for manufacturing improvements and results. The problem of a chemical process cannot always be solved in six months; it may take years. Accordingly the manufacturer is somewhat reluctant to spend money for something that does not yield an immediate return.

To properly promote the advancement of this great industry, as yet in its infancy so far as America is concerned, but which no doubt will be ultimately highly remunerative, there must be employed technically trained men, at a compensation commensurate with ability, to value the raw materials, produce high-grade products, suggest the utilization of the various substances and control the processes, also to carry on preliminary experimental work on byproducts which are now going to waste and which will eventually be recovered at a profit.

Ballads of a Coal Miner--II

By Berton Braley

Here I am now with my lamp an' my pick
Ready an' willin' to start on my trick,
Primed for the kind of a job I must do—
One of the underground crew.

Ready to ride on the rackety cage
Down to the room where I'll sweat for my wage,
Dusty and grimy an' sooty to view—
One of the underground crew.

Down in the depths in the blackness and murk
Down where the dust an' the gases may lurk,
Down where the chances is—well, not so few—
One of the underground crew.

Folks must be warm an' the engines must turn,
There must be coal for the boilers to burn;
I've got to labor to bring it to view—
One of the underground crew.

Somebody's got to be sweatin' down there, far from the sun an' the pleasant fresh air,
Somebody's got to—an' so it's my cue—one of the underground crew.

Problems in Successful Coking

By F. S. Johnson*

SYNOPSIS—A short résumé of the coking industry in the United States, together with instances showing that in order to secure good coke it is sometimes necessary to pay careful attention to methods of mining. Carelessness underground often results in inferior coke.

The early history of the coke industry is somewhat vague, and various authorities disagree as to the date of its beginning. According to Fulton, coke is known to have been used successfully in Shropshire, England, as early as 1735, but was not employed extensively as a blast furnace fuel until 1750.

The first positive knowledge we have of its use in America was in 1817, or about 30 years after the close of the Revolution, when the expansion of the iron industry had made it necessary to seek a cheaper fuel than charcoal, which up to this time had been used exclusively for blast-furnace operation.

Practically all that is known of the manufacture of coke in the United States between the years 1817 and 1825 is a mention of the fact that coke was "made on the ground."

In 1825 a representative for the Society for the Promotion of Internal Improvement in Pennsylvania, who had been sent to England to ascertain the most improved methods of iron manufacture there, submitted a report giving detailed drawings of ovens in use for the manufacture of coke.

This report no doubt resulted in much experimenting, but not until 1841 do we have any authoritative knowledge of the use of coke ovens. This is obtained from the report of J. D. Weeks on the manufacture of coke in the United States in the census year of 1880, in the form of the following incident, the relator being a Mr. Provance McCormack:

> James Campbell and myself heard in some way that I do not recollect that the manufacture of coke might be made a good business. John Taylor, a stonemason, who owned the farm on which the Fayette Coke Works now stands and who was mining coal in a small way was spoken to regarding our enterprise and proposed a partnership—he to build the ovens and make the coke and Mr. Campbell and myself to build a boat and take the coke to Cincinnati, where we heard there was a good demand. This was in the year 1841. Mr. Taylor built two ovens. I think they were about 10 ft. in diameter. My recollection is that the charge was 80 bu. The ovens were built in the same style as the ones now used, but had no iron ring at the top to prevent the brickwork from falling in when filling the oven with coal, nor had we any iron frame at the mouth where the coke was drawn. The top and mouth had to be repaired when they fell in. In the spring of 1842, enough coke had been made to fill two boats—about 800 bu. each—and we took them to Cincinnati down the Youghiogheny, Monongahela and Ohio, but when we got there we could not sell. Mr. Campbell, who went with the boats, laid at the landing some two or three weeks, retailing out one boatload and part of the other in small lots at about 8c. a bu.
>
> Miles Greenwood, a foundryman of that city, offered to take the balance if he would take a small patent flour mill at $125 in payment, which Mr. Campbell did. He had it shipped here. We tried it, but it was no good, and we sold it to a man in the mountains for $30. This ended our coke business.

Although this attempt at coking coal in ovens proved rather discouraging, a slow growth continued as is evidenced by the fact that in 1859 the Fayette Coke Works constructed a battery of 30 ovens.

Coke Making Has Kept Pace With Steel Making

It would be interesting to trace the growth of the industry from the coke "made on the ground" requiring from 5 to 10 days for complete carbonization, depending on weather conditions, with a 50 per cent. yield, to the last word in byproduct ovens, where the time of coking and the yield are almost optional. But to do this would necessitate a like treatment of the iron and steel industry, upon whose growth the coke industry is almost entirely dependent. However, when we consider that at the end of 1913 there were 575 coke-making establishments in this country, distributed in 24 states, with over 100,000 beehive and over 5000 byproduct ovens, we can appreciate the great progress made in the 50 years following the building of the first 30 ovens in Pennsylvania.

While this phenomenal growth is something of which to be justly proud, there is yet much to be desired in the coke industry of this country. The same figures showing this wonderful expansion also reveal the ratio of beehive to byproduct ovens to be 20 to 1 and mark us as the most extravagant of peoples in the exploitation of our natural resources.

At a byproduct plant in Great Britain recently, experiment showed that from every ton of coal charged there was obtained from 12 to 15 cwt. of excellent coke, which sold in the market for $7.50 per ton; also 30 lb. of ammonia, which sells for $63 per ton, 100 lb. of tar at $8.50 a ton 2½ gal. of benzol worth 60 cents and 5000 cu.ft. of gas. All of this would have been wasted had beehive ovens been used, with the exception of the coke, and in that case the yield would probably have been much less.

To show more accurately our extravagance and wastefulness from this source we may take the statistics compiled by the Bureau of Mines for the year 1913, in which our own market conditions, etc., are taken into consideration.

Of approximately 570,000,000 tons of coal mined in that year, 75,000,000 tons, or 13 per cent., was used for making coke and gas. Had all of this coal been coked in byproduct ovens, the higher yield of coke would have increased its value $10,000,000, while $80,000,000 worth of byproducts would have been recovered. In other words, there was wasted in the coke industry of the United States in one year $90,000,000.

Byproduct Ovens Give an Increased Yield

While this condition of affairs is usually condoned by the great difference in the initial cost of the ovens and the sometimes inferior quality of the coke produced in the byproduct process, these facts are not sufficient to justify the present procedure, as the following results given by various investigators will prove.

In beehive ovens, Pocahontas coal containing 18 per cent. of volatile matter gives a yield of 62 per cent. of coke. In Semet-Solvay ovens, the same coal yields 85 per cent. of coke. Connellsville coal containing 32 per cent. volatile matter yields in beehive ovens 64 per cent. of coke and in Semet-Solvay ovens 72 per cent. of coke. Considering the comparative cost of the two types of ovens on these figures alone, the surprising cheapness of the byproduct oven is shown. The chief objection formerly raised to byproduct coke was its dark color, produced by watering outside of the oven. This of course was nothing more than a prejudice on the part of the foundrymen, which is rapidly being dissipated, as is evidenced by the large corporations that are increasing their byproduct plants and using more and more of this fuel each year.

---

*Coalton, W. Va.

While considerably more skill is required for the successful operation of byproduct ovens than for those of the beehive type, there are certain fundamental precautions to be observed in mining and preparing a coal for coking which are equally essential to both types.

Physical Structure Is Improved by Coal Crushing

Every experienced coke maker knows the benefit derived in the physical structure of the coke from a fine crushing of the coal, making a lighter, more uniform and stronger product. While this advantage is generally recognized, it does not by any means solve the question from a chemical standpoint, and additional methods of treatment are frequently required, varying with the composition of the coal and the condition in which the impurities occur.

It is not the intention of this paper to go into the merits of the various coal-cleaning equipments upon the market today. On the other hand, it is well worth while to mention one or two things which frequently escape the notice of the average coke operator and which sometimes play havoc with the quality of his product.

At most coke plants where the ovens are located at the mines, it is the general practice to screen the coal, using the slack in the ovens and shipping the larger grades. Market conditions sometimes render this plan impossible, and in order to keep the ovens in operation it becomes necessary to crush the entire output of the mine.

Such a contingency recently arose at a plant that had been producing a coke uniformly low in ash and sulphur. Almost immediately complaints which were unknown previously began to pour in. Several analyses of the crushed run-of-mine coal showed an ash and sulphur content of 12.15 and 1.78 per cent. respectively, producing a coke averaging 17.81 per cent. of ash and 1.41 per cent. of sulphur, while an average of an equal number of the slack samples had previously shown 8.8 per cent. ash and 1.28 per cent. sulphur, producing a coke of 13 per cent. ash and 0.96 per cent. sulphur.

Cause of the Trouble

Investigations concerning the method and time of burning proved that everything was normal in these respects, so that inquiries were directed to the inside of the mine, where it was soon discovered that because of the slate and sulphur partings being confined to the upper portion of the breast coal little breakage occurred during mining and the impurities remained in the larger grades, being removed by the trimmers in passing over the screens. Consequently these impurities had not affected the coke while the slack alone was being used, but caused trouble when the run of mine was crushed for coking.

The difficulty in this case was surmounted by confining the work to that portion of the mine containing the cleanest coal—a bad practice from a mining point of view; but it saved the day for the coke and fortunately did not have to be continued long enough to injure the future development of the mine.

At another plant the ash in the coke took a sudden rise while the same grade of coal (slack) was being used as usual. Several samples showed an analysis of 15 per cent. ash with a correspondingly ruinous ash content in the coke. These results also led to an investigation on the inside of the mine. In this case it was found that the cutting machines in the hands of new runners were being allowed to cut on the bottom as well as in the bone coal near it. The dust from this impurity was being so finely divided that it could not be eliminated by screening.

These incidents of serious trouble and their correction by simple precautions are not cited as cure-alls. Neither are they recommended to take the place of coal-cleaning machinery. They suggest, however, to a large number of practical coke manufacturers who do not always have technical knowledge at their immediate disposal how much may be accomplished toward improving their product by carefully observing the inside as well as the outside preparation of their coking coal.

⁂

Alabama Operators to Meet

The Alabama Coal Operators' Association will hold its annual meeting at Edgewater, Ala., Saturday, July 10, 1915. A special train will leave the Louisville & Nashville station in Birmingham at 9 a.m., arriving at Edgewater at 10:10 a.m.

The morning session will be held at the local hall, where motion pictures on welfare work in mining and allied industries will be shown, together with lantern slides. Papers will also be read by H. S. Geismer, of Birmingham, consulting mining engineer, on "Coal Washing and the Preparation of Coal for Market," and by A. F. Elliott, chief electrician of the mining department of the Tennessee Coal, Iron & R.R. Co., on "Factor of Safety in Mine Electrical Installations." After a luncheon at Bayview the operators and their guests will return and inspect the commissary, plant and town at Edgewater. On returning to the hall, Milton H. Fies, vice-president of the De Bardeleben Coal Co., will read a paper on "Underground Safety Precautions," followed by Daniel Harrington, of the U. S. Bureau of Mines, the title of whose paper will be "The Use of Permissible Explosives." Motion pictures on safety methods of bituminous-coal mining and lantern slides showing the testing and use of explosives and demonstrating how explosives should be handled will be the concluding feature on the program.

COMING MEETINGS

American Mine Safety Association will hold the following meet: July 23-24, Billings, Mont. Secretary, H. M. Wilson, 40th and Butler St., Pittsburgh, Penn.

Alabama Coal Operators' Association will hold its annual meeting at Edgewater, Ala., on July 10, 1915. James L. Davidson, secretary, Birmingham, Ala.

The Order Kokoal will hold its annual pow-wow at Chicago, Ill., July 13 and 14, 1915.

The Southern Appalachian Coal Operators' Association will hold its semiannual meeting July 23, 1915, at Knoxville, Tenn. J. T. McCoy, Knoxville, Tenn., is secretary.

The United First-Aid Corps of the 4th district, Delaware, Lackawanna & Western R.R. Co.'s coal department, will hold its third annual first-aid contest at Harveys Lake, Penn., on Aug. 14, 1915. Secretary, Lewis Richards, 212 East Green St., Nanticoke, Penn.

West Virginia Coal Mining Institute

By E. N. Zern*

SYNOPSIS—The West Virginia Coal Mining Institute held its regular summer meeting at Wheeling, W. Va., the attendance being large. Some members urged that many mines were loaded with overmuch coal land and as a result could not pay dividends in slack times.

The hot-weather meetings of the West Virginia Coal Mining Institute generally fail to attract the larger crowds. Not so the meeting held at Wheeling on June 16 and 17. At the opening session, held in the assembly room of the Hotel Windsor, 60 were present, and the attendance later exceeded 150. The interest was lively throughout, and each paper was followed by general discussion.

After the mayor's representative, the president of the Board of Trade and the secretary of the Chamber of Commerce had each in turn extolled the praises of Wheeling and assured the conclave that the city bestowed the proverbial key and freedom upon them, President J. C. McKinley read his address on "Coöperation." He urged the operators to coöperate in all activities connected with the mining and selling of coal, and especially pleaded for unity among West Virginia mining men in standing behind the institute and assisting it to serve the high purpose for which it was founded.

Samuel M. McMahon, who was recently appointed to one of the three newly created mine inspectorships in the state, read a paper on "Success in Mine Management." He declared it poor policy to seek major economies by installing expensive machinery and appliances and meanwhile lose sight of minor details such as the proper use of spikes, insulators, company tools, etc. He cited a case where tin foil served as an emergency packing for a pump.

During the discussion, attention was directed to the distress in which several of the best-equipped plants in the country have found themselves during the depression and the comparative composure of the operator who, with a few battered mine cars and a string of wheezy mules, continued his output of a few hundred tons per day. Hebron Robinson hoped that the time would soon be at hand when operators would be satisfied with a reasonable acreage and cease burdening themselves with large reserves.

A business session followed and was devoted to the question of continuing the *Bulletin*, two numbers of which were issued in the months of April and May as an experiment. The secretary read his report for the first half of the year, showing receipts and expenditures fairly well balanced. It was finally voted that the paper be continued, the publishing details being left to the executive committee. It is not stated when the next number of the monthly is to appear.

Capitalizations of $5 to $6 per Ton-Year

W. E. Fohl opened the afternoon session with a paper on "Valuation of Coal Lands." At its conclusion the probable influence of the byproduct coking industry was discussed. It was thought that it would enable other seams of coal to compete with those such as the Pittsburgh in the Connellsville region, which have hitherto been regarded as being the best coking coals.

A mine, quoted in Mr. Fohl's paper, showed an investment of $1,980,000 and a coke output of 200,000 tons per annum. It consequently used about 300,000 tons of coal. This made some members question, What is the proper relationship between capital and tonnage? P. A. Grady thought a correct ratio was maintained only when the yearly tonnage equaled or exceeded the total capital invested. A coal company was cited which had to pay the interest charges on $5 of bond issue for each ton of coal hoisted.

G. M. Shoemaker in his paper, "A Mine Sprinkler," explained how a coal company, facing the coal-dust menace and compelled to conserve cash as well as coal, built a sprinkler at a low cost and it proved satisfactory in every respect. His paper was accompanied with photographs. The discussion digressed to the use of exhaust steam for moistening dust, the virtues of stone dust and the uselessness of calcium chloride as a dampening agency.

At 5:30 p.m., having been previously assured that the Ohio was free from submarines and such mines as bring terror even to seasoned coal men, the good ship "St. James" with 200 on board set forth up the river. The local Chamber of Commerce provided the excursion, also the banquet served on deck. Several of the leading citizens of Wheeling, assisted by many silver-tongued members who had been forewarned by the toastmaster, provided the after-dinner oratory.

On Thursday morning, J. A. Garcia, of Chicago, presented his paper on "Handling Wagons at Shaft Bottoms," accompanied by lantern slides showing bottom arrangements at mines in Illinois. Curiously enough, at the very time Mr. Garcia was presenting his paper two prominent engineers connected with a large West Virginia company were on their way to Illinois to see the kind of bottom installations in use there. Mr. Garcia was plied with questions relating to the construction of arches about shaft bottoms and the use of the Holmes automatic empty-car lift.

L. M. Jones, of the Bureau of Mines, then described recent developments in the use of stone dust. He made use of a number of lantern slides showing Taffanel and Rice barriers and the construction of stoppings, overcasts and door frames, charged internally with stone dust and so contrived that the force of the blast would wreck the structure and cause the inert dust to mingle with the flame of the explosion.

Keeping a "Close Tab" Indeed

"The Utility of the Telephone in Mine Operation" was presented by L. W. Brown. He warmly espoused its use and to its installation ascribed a large increase in output at a mine under his observation. One member disputed his claim. R. Z. Virgin cited an instance where the telephone proved a nuisance. The general manager of the company was city-bred and not broken to mine work

---

*Secretary-treasurer and editor, West Virginia Coal Mining Institute, dean of department of mining engineering, Morgantown, W. Va.

At 9 o'clock each day the mine reported to the city office the amount of coal hoisted up to that time. If the report showed 40 tons less than on the day previous, a connection was demanded with the underground system, and trackmen, drivers, etc., were sent scouting in all directions to fetch the superintendent that he might explain the appalling drop in tonnage.

H. H. Clark, of the Bureau of Mines, opened the afternoon session with his paper on "Portable Electric Mine Lamps." He informed the institute that the bureau has added serviceability specifications to the usual safety requirements. These must be met before a lamp is "approved."

The paper by Josiah Keely on "Prevention of Mine Accidents" was minus the burden of statistics which we have come to expect when hearing this topic discussed. He contrasted the savagery in Europe, where the slogan is "Slaughter first," with the attitude of the operator, whose watchword is "Safety first." Mr. Keely presented some of the difficulties confronting the official who labors along humanitarian lines. It is not to be expected that large sums can be appropriated for welfare, sanitation and accident prevention when profits in the coal business are reduced to the vanishing point. Comment was made on the indifference of the workman to the dangers which beset his occupation and to the antagonism often encountered from the miner's union when an attempt is made to enforce discipline and the mining law.

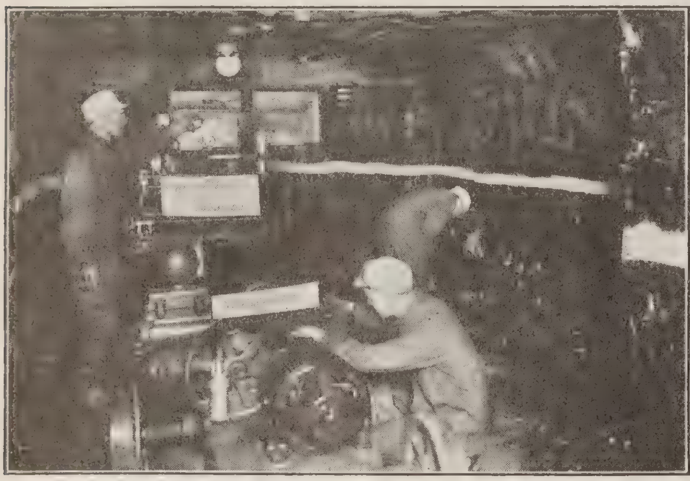
The question-box session was devoted to workmen's compensation, mine cars, welfare work and gathering locomotives, and the time provided proved to be far too short to do justice to the topics discussed. The meeting adjourned with a vote of thanks to the good people of Wheeling for the entertainment provided.

⁂

Bureau of Mines Panama Exhibit

One of the most interesting features of the exposition in San Francisco is "the mine," located under the floor of the Mines and Metallurgy Palace. The attendants in charge of this exhibit are actually experienced mine workers.

There is a main haulageway in this imitation mine, in which operate Westinghouse electric trolley and storage-battery locomotives. Metal-mine cars are used in the metal-mine section and coal-mine cars in the coal-mine section. Explosives are handled in safety magazines loaned by the Hercules Powder Co. In the pumproom, compressor-room and hoistroom the visitor will find all the modern machinery designed to fulfill pumping, power and hoisting duties.



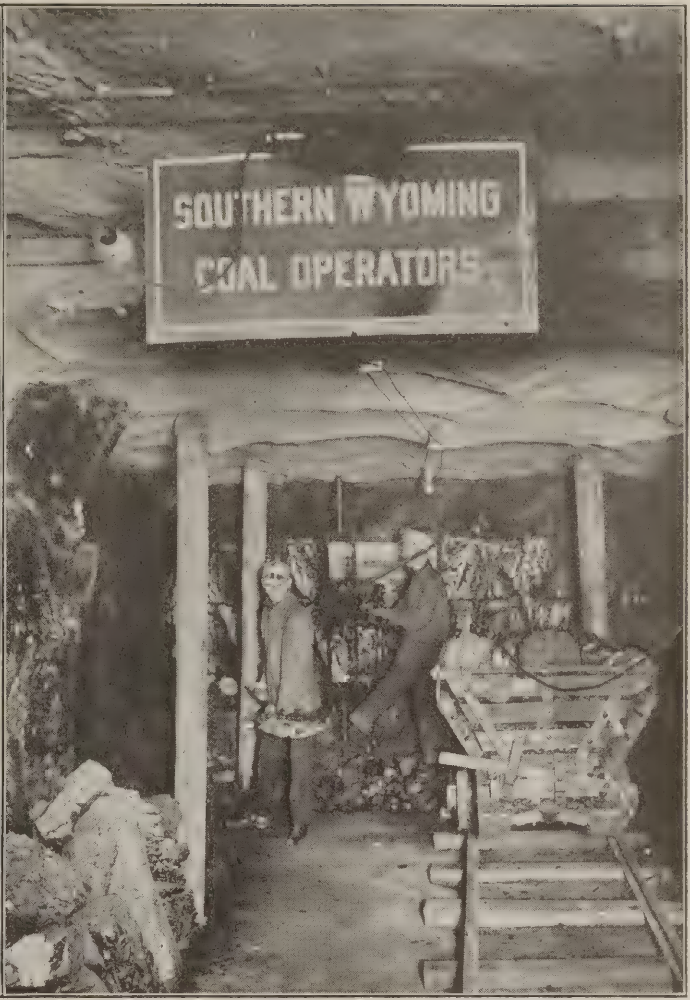
Exhibits of Jeffrey Manufacturing Co., Fairmont Mining Machinery Co. and Consolidation Coal Co.

This Exhibit Represents a Room in the Mine of the Pocahontas Consolidated Collieries Co.

E. I. du Pont Powder Co.'s Booth

Exhibit of Hercules Powder Co.

Shaft Entrance to "The Mine"



Display of Southern Wyoming Operators

There is a foreman's office, with the usual maps and other paraphernalia, an underground first-aid station and an underground surveyor's station with instruments. The coal-mining rooms and the metal-mining stopes are exact reproductions to close scale of those they represent, including the methods of timbering.

The popularity of "the mine," enhanced by the spectacular mine explosions, with accompanying first-aid demonstrations, is such that the number of visitors is so large that the attendants find it difficult properly to handle the crowds and at the same time demonstrate the exhibits.

The Labor Situation

SYNOPSIS—The union in West Virginia has made progress under Thomas Haggerty's administration. The Ohio referendum canvass will cost about $60,000 and may be abandoned. Hocking Valley operators are declared to be about to shut down indefinitely. The coöperative system in Illinois is strongly opposed by union men. More night-riding occurs in western Kentucky.

Apparently C. J. Albasin, the district president of the eastern Ohio miners, is not the only labor leader with a fight on his hands. Thomas Haggerty, member of the International Board of district No. 2 (central Pennsylvania), finds the central West Virginians disposed to split and to disparage his services. In a long manifesto he reviews his work, as he sees it, since November, 1912, when he first visited the field for a short time, to return for a longer stay in January, 1913. He states that there were only 1376 members of the union in the Kanawha field at that time, whereas there are now 7500 members. Two years ago there were 48 unions, whereas there are now 310. There were then 21 coal companies that signed contracts with the union; now there are 127 so signing. Mr. Haggerty says that the guard system is abolished, wages are raised 14½ per cent., the checkoff established, a 9-hr. day introduced, a semi-monthly pay secured and checkweighmen provided on all tipples. Thomas Haggerty has been accused of using the funds of the union to secure the election of L. C. Rogers and his associates. The committee of the International Executive Board has completely exonerated him and the men elected.

Ohio Referendum Canvass Apparently Too Expensive

In Ohio it appears to be doubtful whether anything will be done to dispossess the Gallagher amendment to the Green anti-screen bill. The union begrudges any expenditures after its long and expensive strike campaign and discovers that the canvass for the referendum petition by which it purposed to upset the Gallagher amendment would cost about $60,000. The officials are loath to spend such a large sum.

The Ohio referendum law provides that petitions of that character must have at least 46,000 signers and these must live in 45 counties of the state. Only 28 counties out of the 88 in Ohio produce coal, and 7 of these produce it in negligible quantities. For this reason the petition will have to circulate in many counties having no coal.

About 1 in every 100 of the 4,767,121 inhabitants of Ohio will have to sign the petitions, and if the canvass is restricted to 45 counties the proportion of signers must be even greater. It is well to remember in this connection that only a small proportion of the inhabitants of Ohio have votes and therefore can sign the petition. Moreover, the farmers are by no means pleased with the long strike and believe that the miners should have accepted the operators' proposition, and in any case they would be disposed to avoid putting the state to the expense involved in a referendum.

A definite announcement will be made about a week hence by John Moore, president of district No. 6, comprising the mining region of Ohio. The proceedings must be hurried as the law allows only 90 days' time for action after the passage of the bill.

The Sunday Creek Co., alleging that it has been betrayed by the eastern Ohio settlement, has closed its mines and its company stores in the Hocking Valley and will supply its orders from its West Virginia mines. The company declares that the new schedule in the eastern Ohio mines is 5c. per ton lower than it would have been had the only change made in that scale been to make the rate of mining 47c. per ton for machine-mined run-of-mine coal. The assertion is tantamount to a declaration that the new scale in the eastern Ohio district is about 2½c. per ton lower than it was before the strike. The miners in the Sunday Creek region are in dire straits, as they can obtain no credit from the local merchants.

Coöperative System is a New Method of Reducing Wages

The coöperative system is making much trouble in Illinois. On May 13 Thomas T. Brewster, president of the Coal Operators' Association of the Fifth and Ninth Districts of Illinois, wrote to Frank Farrington and the State Executive Board of the United Mine Workers of America protesting against coöperative mining. The men at these mines are paid the union scale less the pro-rata losses of operation. The result is practically an evasion of the scale, and Mr. Brewster threatened to demand a new contract.

The miners' union does not like this form of coöperation any better than the operators. The men who are practically working for less than union wages are getting steady work while others who are employed at noncoöperative plants are working short time. On May 20 Frank Farrington addressed a strongly worded letter against such coöperation to the officers and members of District 12.

Winkle, in Perry County, Ill., is one of the important centers of the coöperative plan, and the Bald Eagle Mining Co. is one of the companies. There has been trouble between the miners who work for the company on a coöperative basis and those who object to such a plan. Threats have been made, and Sheriff Charlton of Perry County has sent deputies to the plant and seized all the weapons he could find in the hands of both factions. The mine is located at Craig, Ill., and in 1913 there were 120 miners employed.

The United Mine Workers of America in Muhlenberg County, Kentucky, have passed resolutions condemning "night-riding" and other violence and declaring that all such acts are in direct conflict with the interests of organized labor.

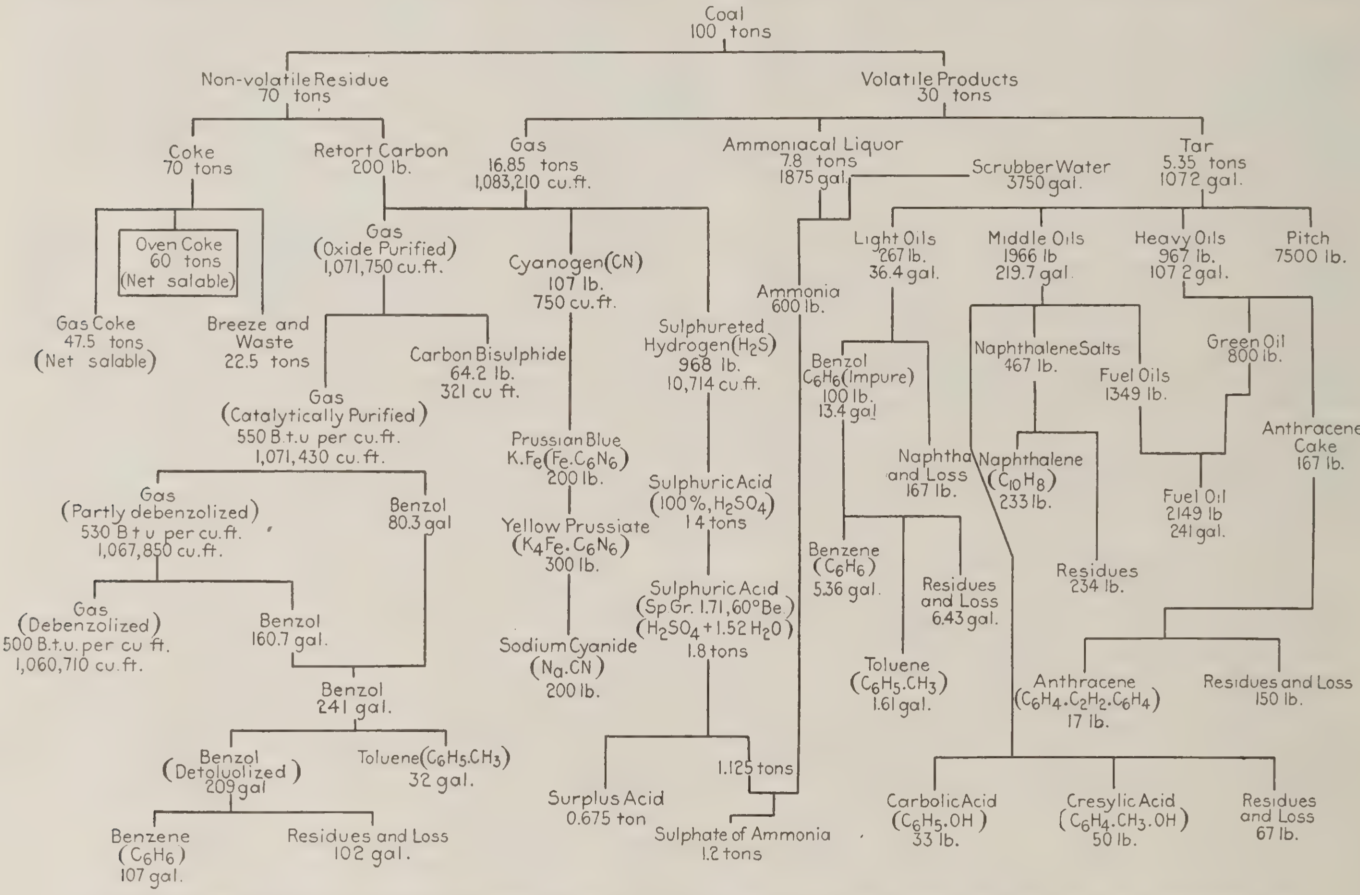
It is stated that S. F. Cates, a landowner and operator of a small mine four miles south of White Plains, Hopkins County, Ky., has been in Madisonville, Ky., trying to sell his property, stating that he had been severely whipped by "night-riders." He displayed the scars of the whips on his face and reported the attack to the county authorities. He said it was his intention to leave the state as soon as he succeeded in selling his property.

John P. White is scheduled to make 32 addresses in the anthracite region between July 8 and July 29, beginning at West Scranton on the first date and ending the campaign at Shickshinny, Penn.

⁂

Byproducts from Coal

The tree appearing in this article was prepared from one made by W. J. A. Butterfield, of London, England, and presented to a conference on the extension of British trade. It shows what byproducts can be extracted from coal in the gas industry. The figures have been changed, as long tons and hundredweights were used in the original table and the gallons used were imperial. Such gallons contain 277.274 cu.in. instead of 231 cu.in., which is the capacity of the American gallon. The imperial gallon is therefore 1.20032 times as large, but as the ton taken by Mr. Butterfield was 1.12 times larger than the short ton the figures were increased by multiplying by 1.07171.



Coal 100 tons
Non-volatile Residue 70 tons
Volatile Products 30 tons
Coke 70 tons
Retort Carbon 200 lb.
Gas 16.85 tons 1,083,210 cu.ft.
Ammoniacal Liquor 7.8 tons 1875 gal.
Scrubber Water 3750 gal.
Tar 5.35 tons 1072 gal.
Oven Coke 60 tons (Net salable)
Gas (Oxide Purified) 1,071,750 cu.ft.
Cyanogen (CN) 107 lb. 750 cu.ft.
Light Oils 267 lb. 36.4 gal.
Middle Oils 1966 lb 219.7 gal.
Heavy Oils 967 lb. 107.2 gal.
Pitch 7500 lb.
Ammonia 600 lb.
Gas Coke 47.5 tons (Net salable)
Breeze and Waste 22.5 tons
Sulphureted Hydrogen (H2S) 968 lb. 10,714 cu.ft.
Carbon Bisulphide 64.2 lb. 321 cu ft.
Benzol C6H6 (Impure) 100 lb. 13.4 gal
Naphthalene Salts 467 lb.
Green Oil 800 lb.
Fuel Oils 1349 lb.
Gas (Catalytically Purified) 550 B.t.u per cu.ft. 1,071,430 cu. ft.
Prussian Blue K.Fe(Fe.C6N6) 200 lb.
Anthracene Cake 167 lb.
Naphtha and Loss 167 lb.
Naphthalene (C10H8) 233 lb.
Sulphuric Acid (100%, H2SO4) 1.4 tons
Fuel Oil 2149 lb 241 gal.
Gas (Partly debenzolized) 530 B.t.u per cu.ft. 1,067,850 cu.ft.
Benzol 80.3 gal
Yellow Prussiate (K4Fe.C6N6) 300 lb.
Benzene (C6H6) 5.36 gal.
Residues and Loss 6.43 gal.
Residues 234 lb.
Sulphuric Acid (Sp.Gr. 1.71, 60° Be.) (H2SO4 + 1.52 H2O) 1.8 tons
Gas (Debenzolized) 500 B.t.u. per cu ft. 1,060,710 cu.ft.
Benzol 160.7 gal.
Sodium Cyanide (Na.CN) 200 lb.
Toluene (C6H5.CH3) 1.61 gal.
Anthracene (C6H4.C2H2.C6H4) 17 lb.
Residues and Loss 150 lb.
Benzol 241 gal.
Benzol (Detoluolized) 209 gal
Toluene (C6H5.CH3) 32 gal.
1.125 tons
Surplus Acid 0.675 ton
Carbolic Acid (C6H5.OH) 33 lb.
Cresylic Acid (C6H4.CH3.OH) 50 lb.
Residues and Loss 67 lb.
Benzene (C6H6) 107 gal.
Residues and Loss 102 gal.
Sulphate of Ammonia 1.2 tons

Table Showing the Various Byproducts of Coal with Some Few Other Bodies Chemically Compounded from These Byproducts

Of course sodium cyanide, yellow prussiate and prussian blue are not direct derivatives from cyanogen. The figures given are those obtained in practice. Theoretically every pound of cyanogen makes 1.88427 lb. of sodium cyanide, 2.3599 lb. of yellow prussiate and 1.96661 lb. of prussian blue.

The Climate of the Mine

At the close of the Eighteenth Century people still believed that the sea air was extremely detrimental to health and the well-to-do people went to inland watering-places. It was the day when, in England, Beau Brummel was the prince of dandies and Tunbridge Wells the home of fashion. Gradually the doctors decreed in favor of the sea, and the word watering-place took a new meaning, and Brighton consequently came into the forefront.

The American people, when they followed the British example of taking vacations, took trips to the sea. From the very first they profited from what was even then the general practice in Europe. Today not one in a thousand knows that the doctors ever taught that sea air was dangerous.

Similarly the alleged dangers of mountain air long kept people out of Switzerland. It is quite recently that we have learned that such air is invigorating and not to be feared if the heart is strong, and we are positive today that some people are bettered by the light air of mountain regions.

In like manner night air persisted as a bogy for many years—in fact, till a far more recent period. The people shut it out of their houses in deadly fear that it would subject them to disease. Now we know that the night air is even better than the air of the day because the sun's warmth favors the growth of bacteria and because in all probability at night the descending dew carries with it millions of microbes and dust particles.

Our view of the climate of the mine is also changing slowly. The scientists used to invent something they were pleased to call "mephitic exhalations." They peopled the "damps" of the mine with every kind of evil and represented them as deleterious as those around swampy places. The dangers of the latter we now know were largely microbial and were spread, not by the damps themselves, but by the mosquitoes and flies.

But it must be admitted that the mines in earlier days were not any too desirable from the standpoint of health. The air used to be so seldom changed, the methane was burned out and not swept away from the faces, and conditions were none too good. But the coal mine today is different. The air is coursed rapidly past the working faces. It comes to the mine, in summer, hot and full of moisture. When cooled in the shallow mines the moisture falls and deposits the impurities, and though there is much suspended coal dust it is harmless.

Those "mephitic exhalations"—pardon the term—moreover are more harmful by far to the smaller microbial and bacterial forms of growth than to our larger organisms, just as water which is harmful to fish has no observable effect on man.

Perhaps the time will come when we will believe the mines the most healthful of places. They seem to agree well with the mules that live in them from year to year and never come to the surface. It may be permissible also to add that the sterilizing effects of their waters largely prevent blood poisoning in those who may be injured. We are slowly beginning to realize that the worst habitat for man is the factory, the saloon, the theater, the church, the school and the home and other places where people can infect one another and where they are apt to shut themselves in. In cool mines, with good ventilation, the conditions for health are at their best. "The evil that men do" to their health comes after they leave the mines.

⁂

Carlyle, Bryan and King

We owe a debt to Mr. Bryan for quoting the following lines from Carlyle in his letter to the people entitled "The Causeless War." That debt is the greater because his quotation raised havoc with his argument. If the elected representatives of the people of any country cannot bind the people of that country, surely Mr. Bryan cannot derive any hope that the chancelleries of Europe can effectually bind those they even less closely represent.

We have little faith that the legislation of representatives truly exhibits the contemporary judgment of the public, but surely the actions of parliaments are more in accord with the popular will than the actions of chancelleries, which in many countries lay not the slightest claim to be representative and which even in our country, checked as their actions are by the Senate, are sometimes found to be strangely out of accord with the national intentions.

For instance the agreement about the Panama Canal made by the Secretary of State and confirmed by the Senate proved to be a most unpopular measure and was upheld by the executive only with difficulty. The public showed a disposition to reject it and would not even consent to have the treaty officially interpreted by the Hague tribunal.

The quotation from Carlyle to which reference has been made runs as follows: "Hast thou considered how thought is stronger than artillery parks, and writes and unwrites acts of parliament, removes mountains, models the world like soft clay."

The spirit of the pronouncement of Carlyle has been repeated recently by Mackenzie King, and all the foolish raisers of strife in Colorado and New York and many of the legislators in the former state have declared against the treason that any man should believe that anyone could do good by power of suasion and generous support of ameliorative measures.

Only those who advocate disorder and discontent or seek to make restrictive laws are allowed to believe they can and are doing good. All the apostles of coercion by law, all the advocates of unlawful violence and all the sinister seekers for political preferment like P. J. Walsh have professed to be shocked at King's statement that "the will and conscience of John D. Rockefeller is more powerful in Colorado at present than any force that could be brought to bear to better conditions."

We are fully of Mr. King's opinion. We will add furthermore that we would make the same statement of John R. Lawson and Mother Jones as he has made of John D. Rockefeller if those two breeders of discontent were together or singly to seek, like Rockefeller, the pacification and betterment of Colorado. For men are better than legislators, and leaders are more than laws. We believe that a generous consideration of labor problems will eventually end social strife. In the end law will do but little. It is "the letter that killeth and the spirit that giveth life." And if a man of influence by reason of past association or by wealth devotes himself to the Colorado problem success is quite likely to follow.

So far from King's statement being un-American, it is animated by the best principles of our civilization. We believe that the public should not be dragooned by law, but led into the right course by suasion.

There is little virtue in enactments unless they are backed by public sentiment, and the law and order that some seek which would permit the burning of mine plants and deny to the owners the right of defense is an order which, while it may commend itself *at times* to the Colorado legislature, or parliament, is advantageous to no one, certainly not to the workmen, and it can never bring peace.

The animus against the Rockefellers is largely a manufactured sentiment. Like Robin Hood, the older Rockefeller has largely despoiled the rich by methods formerly followed by the general busmess world and enriched the poor by the giving of liberal wages. One of the charges against the older Rockefeller which has stuck is that he paid his men in the oil fields of Pennsylvania wages bigger than his competitors could afford and gave his men model treatment without any taint of paternalism.

One cannot understand why, to the workingman, Rockefeller has not been a popular idol. Those well-to-do who have suffered from his competition are far more willing to do him honor than the workingmen to whom he was always a ready paymaster and an unmagnetic though by no means an ungenerous friend.

He is largely the victim of the organized discontent of the coal fields, and it would seem that he must often contrast the frugal, industrious, appreciative American employees in the oil fields of Pennsylvania who pumped his wells and pipe lines with the polyglot and too often discontented people he now has to deal with on his coal-mining properties.

⁂

The Hypochondriacs

Hypochondria is a most painful depression of mind or spirits. The patient who suffers from it usually reads all the patent-medicine advertisements and sincerely believes he has all the diseases mentioned. This evil is so common that some doctors have seriously suggested that advertisements suggesting ailments and asking the question, Do you have this or that? be suppressed.

But hypochondria is not found solely with regard to bodily ills; it is unfortunately frequent in relation to matters political. The operator often has the disease with regard to his employees. He imagines that all kinds of unholy purposes animate them. Just as a true hypochondriac dwells on one symptom till he imagines he has every disease, so your operator dwells on the folly of one man, expands it and applies it to a whole class.

And hypochondria among the workingmen is also most prevalent, and the danger of it is heightened by the lurid literature current regarding the diseases of society. Sometimes the public feels that these treatises on imagined human frailty should be suppressed so that the men with weak minds may be saved from misapprehension, and then again the problem arises as to just who could decide what leads to hypochondria and what tends to health.

The disease of hypochondria is common enough, as a review of contemporary literature proves. Therefore the duty of every citizen who is sane and sound is to be always as ready to give his views as are those who are victims of hypochondriacal obsession. Unfortunately both operators and men too often make these mental wrecks their leaders and strive not to controvert their perverted visions, but actually try to believe the fallacies they teach.

But on further thought is not that statement tainted with hypochondria, for capital and labor have been frequently led by the sanest kind of leaders, such as Gary, Rockefeller, White, Lewis and Mitchell? After all, sanity is encouragingly in the majority and the great mass of men refuse to follow where hypochondriacs lead.

⁂

A Legal Decision Interesting to Coal Men

The Supreme Court decision in the National Cash Register case will prove encouraging to the mining industry. Many mine owners and operators have been prevented from engaging in coöperative measures because of the uncertainty of the construction of the Sherman antitrust laws by the courts.

Most men want to do the right thing, but what may seem perfectly right to one may appear as quite wrong to another, especially to those not familiar with the situation. The courts are the impartial judges to determine whether such coöperative actions are necessarily illegal, for if they are needful to one side they may not be injurious to the other. The decision will be welcomed especially by the coal interests that are now considering the adoption of economic coöperative measures.

⁂

Reducing Sizes of Anthracite

For a number of years past Philadelphia dealers have discussed the advisability of requesting the mining companies to reduce the number of domestic sizes of anthracite from four—namely, egg, stove, chestnut, and pea—to two. The idea of many was to mix the egg and stove sizes and call the outcome "heater" coal, and then to create a size called "range" coal from the mixture of chestnut and pea sizes. The dealers favoring the change contended that the two sizes would answer every practical use now secured by four and that the dealers would then have to provide storage room for two sizes only.

The agitation finally resulted in the presentation of a formal resolution at a meeting of the Philadelphia Coal Exchange on May 27. The proposition was argued at great length from all angles, with the result that the exchange unanimously decided against the suggestion, and furthermore, instructed the secretary to send copies of the resolution covering its action to all the producing companies, because many of them had been approached on the subject by individual dealers. A change in sizes is likely but it will not be so radical as that just described.

Sociological Department

Manager's Round-Table Talks

The officials of the Utah Fuel Co. will hold meetings monthly so as to enter into closer relationship with one another and create a better *esprit de corps.* Such gatherings will help them to interchange ideas and to collaborate in the consideration of problems of vital interest to the company.

The attendance at these meetings will not be restricted to superintendents, but the resident engineers and foremen of the various mines will be invited to attend as well as visitors from the outside who may be interested and able to give valuable suggestions.

The first meeting was held Apr. 26 at a camp where a new field of coal was being opened. The workings at this place presented some features with which most of the officials had not, as yet, had experience. The new work consisted of lining with concrete a haulage tunnel through a stratum of rock that disintegrated upon exposure to air. Part of the tunnel was lined with reinforced concrete and in part the sides and roof were coated with cement mortar, all the work being done by the pneumatic method.

Upon their arrival at the camp the members of the party donned their pit clothes and went into the mine and saw the men spraying the tunnel with cement mortar. They then went to the coal faces and inspected the results of experiments with Red H No. 5 powder. These experiments had been previously made by the resident engineer, and the miners had been instructed how to obtain the best results with the minimum number of shots and the smallest quantity of powder. These results have proved that it pays both the miner and the company to carry on scientific investigation and instruction.

After supper the party gathered in the mine office, and with the aid of cigars furnished by the company proceeded to business. Five superintendents, three engineers, including the chief, two foremen and the general superintendent were present, the latter presiding.

It will be the custom at these meetings for the general superintendent to review first the results of the preceding month's operations at the mines. The lowering of costs or the improvements in mine conditions will be noted and the efforts of successful officials praised. Poor results will not be specifically mentioned, as the desire of all the superintendents is to keep at the top of the list, and commendation for the successful and not censure for the less competent is the remedy for poor records.

As the April meeting was the first held, no particular subject was taken up for discussion, but all present were requested to state what subjects they thought were of greatest importance.

At this meeting the following subjects were proposed: Standardization of materials and methods of using same, safety first, quantity of day's work for different grades of workmen, sanitation of camps, harmony and coöperation in departments, systematizing the distribution of tools and materials in mines, recovery of material in retreating work, proper methods of drawing pillars, standard tracks and methods of laying, quality of product, correct blasting methods and education.

These twelve subjects will keep the conference busy for at least a year. In view of the fact that the Utah Fuel Co. has already taken the first step toward instituting a campaign of education for foreigners in all its camps it was decided to have "Education" for the topic of the next regular meeting. After the meeting had adjourned the rest of the evening was spent in conversation.

◆

Saving Ten Million Dollars a Year

Statistics gathered as to the money sent abroad from Wilkes-Barre during the first six months of 1914, before the outbreak of the war, leads to the conclusion that an outflow of nearly $10,000,000 a year from the anthracite coal fields of Pennsylvania has been stopped. The amount of money sent from Wilkes-Barre through the post office, banks and ticket agencies from Jan. 1 to July 1, 1914, was approximately $350,000. That sent through the post office includes the Kingston, Parsons, Luzerne and Ashley branches, which means that a population of approximately 75,000 shipped this amount.

The counties of Carbon, Lackawanna, Luzerne, Northumberland and Schuylkill, in which 96 per cent. of the anthracite is produced, have a population of about 1,050,000 persons, so that if money was shipped proportionately from all parts of the region the amount for six months would be $4,900,000. The amounts of money sent to Europe are largest during the Christmas holidays, so that the total annual sum cannot have fallen far short of $10,000,000.

The greater part of this was formerly remitted to Russia, Austria, Germany, Italy, Greece and the Balkan States. The sums sent to the Suwalki region in Russia, recently the scene of desperate fighting, were especially heavy. The *Wall Street Journal* recently estimated the annual amount of such remittances from the United States at $250,000,000, of which $100,000,000 went through the post office and the rest through banks, immigrant bankers and steamship and ticket agencies. The remitting of this money abroad by our alien population has now practically stopped.

All the money sent abroad from the anthracite coal region is saved out of the wages of the foreign-born workers in the anthracite mines. Of recent years the amount has decreased because the miners are buying their own houses and investing their money locally. Local bankers state that the maximum remittances were made a decade ago, when laborers were more accustomed to work here for a few years and then retire to their native lands on their savings. The decline in the amount of money sent abroad is a sign that the foreigner is now taking root.

Discussion By Readers

The Mine-Car Question

Letter No. 3—Cars used in the bituminous mines are built in a great variety of styles and sizes and for widely varying gages, but they seldom have a capacity exceeding 100 cu.ft., or about 2½ tons. In the majority of mines, the capacity of the cars is much less, averaging from 1½ to 2 tons. The cars are usually built with outside wheels, and the sides of the car are flared above the wheels so as to provide an increased capacity. They are mostly built of wood, although steel is used to a limited extent in these mines.

In the accompanying sketch I have shown the styles of mine car that are best adapted for use in thin seams and seams of moderate thickness. I have assumed an average thickness of 3 ft. in the first case and 6 ft. in the latter. The cars are shown as standing on the entry track. It may be assumed, however, that wood rails are used in the rooms, particularly in the thin seams. These cars, for an inside length of 6 ft., allowing 40 cu.ft. per ton and assuming a topping of 6 in. in each case, will have a capacity of 1600 lb. in the 3-ft. seam and 2 tons in the 6-ft. seam, using 10-in. wheels in the former and 16-in. wheels in the latter case.

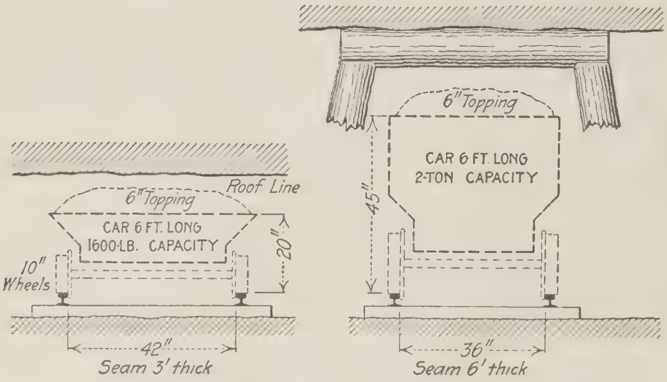

Diagram of Cars in Thin and Thick Seams

The capacity of the car is determined by the desired output, length of haul, grade of haulage road and the kind of haulage employed, which determine the number of cars that can be hauled in a trip and the speed of hauling. Due regard must be had, also, for the size and weight of car that can be safely handled under the conditions existing in the mine. On good clean level tracks men can push cars that weigh 3000 lb. and carry a load of 2½ tons, making a total moving load of 4 tons for a loaded car. Such a load, however, is difficult to start and stop. Cars that must be moved by hand should not weigh to exceed 2 or 3 tons at the most when loaded. In this regard, however, much will depend on the condition and kind of track over which the car must be moved.

The size or diameter of the wheels greatly facilitates the movement of mine cars. Cars having 14- or 16-in. wheels are moved much more easily than cars of the same size having 10- or 12-in. wheels, other conditions being the same. Narrow track gages permit cars to be moved more easily than broad gages. In coal-mining practice the gage of haulage tracks varies from 28 to 42 in. ordinarily, depending mostly on the size of the car. The wheelbase, or distance from center to center of the car axle, rarely exceeds 42 in., and is often considerably less than this. Cars having a short wheelbase can be used on sharper curves in the track; also, when derailed, they are more easily replaced on the track.

When the capacity of the car has been determined, in accordance with the conditions mentioned, the dimensions must be made to conform with the width of the hoisting shaft, the nature of the roof and floor, and the thickness of the seam. For example, in mines where it is necessary to take the cars to the face to be loaded, the thickness of the seam practically limits the *height* of the car. Again, a bad roof or a soft, heaving bottom often necessitates the driving of narrow entries, and this limits the *width* of the car, making a certain allowance for clearance on each side of the road. The *length* of the car is generally limited by the width of the hoisting shaft. In determining this dimension, a sufficient allowance must be made for clearance in the shaft. This should vary from 6 to 10 or 12 in., according to the condition of the shaft. In the absence of specified details, an allowance of 6 in. for bumpers and end-boards should be made at each end of the car. The dimensions, length, width and thickness, are estimated from the required capacity as inside measurements.

George Stockdale.

Mt. Braddock, Penn.

Letter No. 4—I have noted with much interest the discussion that has recently arisen in reference to mine-car construction. My attention was first attracted by the article of R. Z. Virgin, Coal Age, May 1, p. 752.

While I have never been a believer in large, heavy and expensive mine cars where a lighter car would answer the purpose, it must be recognized that conditions of mine haulage have greatly changed from the time when there was not the demand for coal that there is at the present day. The output of the mine was small, and mules were used to haul the cars underground. The cars for that purpose could be built light and were inexpensive.

The present great demand for coal has led to the employment of electric or compressed-air locomotives, which have largely replaced the mule on the main-haulage roads of every uptodate mine. The mine cars for this service require to be built more substantially so as to withstand the heavy bumping and jerking incident to the haulage of trips varying from 100 to 200 tons.

The question of what constitutes the best mine car should be left largely to the coal-mine operator to determine, although I freely admit that there is a wide variation of disposition on the part of many operators who often will not hestitate to spend $2000 for an electric locomotive to take the place of mules underground, believing that the electric locomotive will do the work more economically. The same operator, however, will hesitate to replace his mine cars with cars better adapted to a heavier service because of the increased outlay required. This may be poor judgment, but is, nevertheless, the condition that must be met by the manufacturers of mine cars.

As a result of this condition, we have in our shop-files over 2000 drawings of mine cars of different patents and varying in sizes and dimensions. In our general catalog, we illustrate 25 of these designs built for track-gages varying from 36 in. to 56½ in. I may say that we have never yet, in our experience, built indentically the same car for any two companies. The reason for this is to be found largely in the fact that no two coal mines are operated under conditions exactly similar in every respect. The car that is suitable for one mine will not answer for service in another mine.

In general, it may be said that the question of daily output together with the conditions existing in the underground workings determine the required capacity and size of the mine car. Again, the height of the mine car above the rails is much dependent on the thickness of the seam and is modified, also, by the question of whether the output of the mine is for steam or domestic use. In our experience, for *domestic* coal a larger percentage of lump is loaded and, in this case, a greater clearance must be allowed above the top rail of the car. Also, the side- or end-boards must be low to permit of the loading of large lumps of coal.

Strange to say, even the method of paying the men controls, to some extent, or modifies the style of car that is desirable. For example, if the miners are paid by the car, they will load their cars only level with the top rail, and will not build them up with a "topping" of coal, as is the general practice where the miners are paid by the ton. It often happens that a coal operator is forced to pay at the same rate on the same basis as another adjoining mine and, for this reason, he is subject to a loss unless he has a car of the same size and weight as that of his neighbor.

In closing, I may say it is our experience that there are more operators using cars that are too large than too small. In our practice, we have probably cut down a hundred different cars or reduced their size on the second order, but I do not recall that we have ever filled a second order with a size *larger* than that called for in the first order. It is worthy of note, however, that where a certain wage scale governs a district, this fact will often make it absolutely necessary for operators to employ cars of light dimensions or capacity.

In considering this question, it is, of course, readily admitted that the lighter the car the more easily it is handled at the working face, and this is a big advantage as it largely affects the daily output of each miner who must load and handle his car in his own room. The question that must be determined in each case is, therefore, whether such car can be handled and loaded economically, taking all these matters into consideration. I do not believe that any absolute rule can be laid down that will determine the size and shape of a mine car for service in all seams of coal and under all conditions of haulage. Each problem must be treated independently to satisfy its own conditions.

H. W. Sanford.

Knoxville, Tenn.

Recent Compensation Act in Pennsylvania

Letter No. 1—Since the passage of the Workman's Compensation Act by the Assembly of Pennsylvania, May 18, 1915, I have been expecting to see in Coal Age some comment on the bill, either editorially or otherwise. This measure has been struggling for birth in the legislature for several sessions and its natal day should not pass altogether without some expression of opinion from the class of people whom it is *supposed* to affect. A discussion of its economic value as a law would be of interest.

At the expressed demand, no doubt, of a majority of her citizens, Pennsylvania has followed the example of numerous other states and passed a law that is expected to be of material benefit to the large class of industrial workers in the state. The measure was for a time successfully opposed by those who feared its effect on their interests, but harmony at last prevailed and the measure received the unanimous approval of all parties concerned.

For the protection of corporate interests affected by this law, the Pennsylvania workman's act contains the following proviso, art. III, sec. 302:

> (a) In every contract of hiring made after December 31, 1915, and in every contract of hiring renewed or extended by mutual consent expressed or implied after said date, it shall be conclusively presumed that the parties have accepted the provisions of article 3 of this act and have agreed to be bound thereby, unless there be, at the time of the making, renewal or extension of such contract, an express statement in writing from either party to the other, that the provisions of article 3 of this act are not intended to apply, and unless a true copy of such written statement, accompanied by proof of service thereof upon the other party, setting forth under oath or affirmation the time, place and manner of such service, be filed with the bureau within 10 days after such service and before any accident has occurred.
>
> Every contract of hiring, oral, written or implied from circumstances now in operation, or made or implied on or before December 31, 1915, shall be conclusively presumed to continue subject to the provisions of article 3 hereof, unless either party shall, on or before said date, in writing, have notified the other party to such contract that the provisions of article 3 hereof are not intended to apply, and unless there shall be filed with the bureau a true copy of such notice, together with proof of service, within the time and in the manner hereinabove prescribed; provided, however, that the provisions of this section shall not be so construed as to impair the obligations of any contract now in force.
>
> In the employment of minors, article 3 shall be presumed to apply unless the said written notice be given by or to the parent or guardian of the minor. It shall not be lawful for any agent of this commonwealth, or for any county, city, borough or township therein, or for any officer or agent thereof, or for any other govermental authority created by the laws of this commonwealth, to give such notice of the rejection of the provisions of this article to any employee of the state or of such governmental agency.

It does not require a very careful study of this section to reveal the fact that, instead of the employer being compelled to become a contributing party to the liquidation of the compensation to an injured employee, as the different provisions of the act require, he is by this section legally armed with the power to annul all rights to claims against him for damages or injuries sustained.

The daily press has heralded this act as being "the most important piece of legislation that has passed the Assembly for years." If its importance measures the benefits conferred on a single class only, it may be considered as one of the most important pieces of class legislation that has ever been enacted in the State of Pennsylvania or any other state.

At the present time, an injured workman possesses the right of seeking redress through a process of common law and stands some chance of securing the granting of his claim. When the present act goes into operation, Jan. 1, 1916, the individual worker will be compelled by the law to relinquish this right, provided the act be upheld as being constitutional, as it undoubtedly will be unless this feature is successfully fought by those most interested.

Not being a lawyer, either constitutional or any other kind, I would not hazard a statement as to the part or parts of this act on which its constitutionality could be contested; but as a member of the laity, it appears to me radically wrong and a usurpation of individual rights. It seems reasonable no law can compel a man to sign away, not only his own, but the personal rights of those dependent on him, in order to secure employment and earn a livelihood.

I believe that the common law emphasizes the point that any affirmation, promise or contract made under duress is not obligatory on the part of the maker. If this be true, why should not a contract containing conditions at variance with legalized rights be regarded as void if not criminal? The former is a compliance secured through physical fear; the latter is a compliance secured through physical necessity. What is the difference between the means employed and the ends secured in either case, except that in the latter the criminality of the means will be legalized?

The right of contract should cease or be declared void when its exercise involves conditions that are inimical to the interests of either contracting party. I do not regard it as a refutation of the argument or a vindication of the act that the right of contract is an inalienable right; it undoubtedly is so when the contracting parties are untrammeled and uninfluenced by the demands of necessity, and I believe that the law assumes that a contract or agreement to be valid must be made by the voluntary action of each of the contracting parties.

By the section of the act to which I have referred, the state has placed in the hands of one class of its citizens the power to compel the acquiescence of another class to its demands.

The industrial classes of the state have "asked for bread and have been given a stone;" they have begged for an amelioration of their condition and the bands of subjection have been drawn tighter by their legislators.

The working classes of Pennsylvania are desirous of securing assistance for those of their number who may be placed in straitened circumstances through the accidents incident to their occupation. They have given their unrequited time, labor and coöperation in their efforts to advance all provisions for safeguarding life and reducing accidents, and I cannot believe that they ask for compensation for accident at the undivided expense of any one class, but they are willing to pay their proportionate share, in conjunction with their employers, for the establishment and maintenance of such a fund. Pennsylvania should be ashamed of having gained the distinction of enacting one of the most farcical pieces of legislation that has ever disgraced the statute books of the state.

Labor in Mining

Letter No. 7—Reading the account given in "Extracts from a Superintendent's Diary," COAL AGE, June 5, p. 964, of a mine strike that resulted in the killing of two nonunion miners calls to mind my own personal experience in a strike at the mines of the Westmoreland Coal Co. a few years ago.

One summer evening an Italian organizer and a score of Italian strikers from Latrobe got off the train at Ligonier. Going to a barroom, they purchased several bottles of whisky and made their way up the Ligonier Valley R.R. to Wilpen, to the plant of the Marietta-Connellsville Coke Co. Here the organizer called a meeting and told the miners to quit work, promising them a weekly relief check while they were idle. He told them, however, that they must work for it and not sleep until 10 o'clock, but must fight hard those "scabs" in order to win the battle.

A big demonstration was arranged and everyone was notified to be at a certain point at 3 o'clock the next morning, when they would march to Waterford, a distance of about two miles. They were to be armed with revolvers and to compel the men working at the Fort Palmer Coal & Coke Co.'s plant to stop work.

They met at the time and place appointed and had gone about half a mile when they overtook two miners riding in a buggy, who were ordered to turn and join the ranks. Upon their refusal to do this, some shooting occurred, one of the strikers grabbing the horse by the bridle while others fired at the men sitting in the buggy. Word soon reached the state troopers stationed at Ligonier, and four of them immediately started to the scene. The miners, on reaching the crest of the hill, saw the troopers galloping along Waterford Pike. Believing that the officers would search them for guns, they all with a few exceptions gave their weapons to two of their number who were hurriedly chosen to carry them away. There were 106 revolvers of various calibers. The two men, with some difficulty, carried these instruments to Frank Bolha's store, where they hid them. This only prevented the riotous and murderous acts that would have followed had the men kept their weapons.

I was also much interested in Letter No. 4 by Karl F. Schoew, June 12, p. 1034. I believe, as he states, there will be a great change in industrial conditions, especially in coal mining. At the present time, everything seems to be at a standstill. There is nothing doing, and many of the miners having large families to support and being obliged to rent their houses face a hard proposition. In some cases they have exhausted their credit at the company's store, and necessity compels them to go elsewhere for work.

In dealing with the strike question, reference has been made to "trouble makers." Much might be added to what already has been said, but it is clear in my mind that coal companies should take every precaution to adopt a system similar to that which is employed in England, where more consideration is given to the miners' actual necessities, and men of large families are assisted in every possible way when times are slack, which establishes a better feeling between the mine officials and the miners generally, and greater harmony prevails.

In closing, I will say that there is probably in every mining camp one or more so-called "leaders." These men no doubt know more than the rank and file of the miners whom they control. They keep posted on market conditions and understand the difficulties and experiences of the company. These leaders, however, are not satisfied unless they are treated a little better than their brother miners. Failing in this, they make every effort to influence the whole camp and arouse the men to make a demand for increase in wages or better conditions in the mines. Unless coal operators are alert to this condition, trouble is sure to follow; but this can often be avoided by suitable tact and prompt action. I heartily endorse the idea of a school for miners where they can learn the English language and become acquainted with coal-trade conditions so that they will better understand when it is necessary for the operator to reduce wages in order to keep the mine in operation.

MINE FOREMAN.

⁂

Preventing Mine Explosions

Letter 2—Referring to Mr. Riley's letter on this subject, COAL AGE, May 29, p. 938, I believe he has omitted to mention a few precautions that are as important in this connection as those to which he has drawn attention.

I would suggest the following as worthy of careful consideration: 1. The use of permissible explosives wherever these can be employed with satisfaction and advantage. 2. The prohibition of the use of dynamite for blasting coal in mines. 3. The prohibition of the practice common with many miners of mixing different kinds of explosives in the same hole. 4. The use of clay or other incombustible material for tamping.

I fully agree with Mr. Riley in the suggestion that all accumulations of fine coal and dust should be prevented, and, as far as practicable, this should be loaded out in dustproof cars. It is impossible, however, to remove and load out all the fine dust that accumulates on the timbers and waste places in the mine, nor is it possible to load out all the fine coal and dust that accumulates on the haulage roads. For this reason, it is important that the roadways and timbers should be thoroughly sprinkled so as to keep the roads continually in a moist condition. This can be accomplished by a suitable spraying system, by the use of water or steam, or by frequently washing down the timbers, gobs and ribs in all passageways. The spraying system is preferable if the roof conditions existing in the mine will permit of its use.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Atomic Heat—An important relation has been found to exist between the atomic weights of the elements and their specific heats. Dulong and Petit (1819) found that the specific heats (relative heat capacity) of most of the solid elements vary inversely as their atomic weights, so that the product of these two factors is a constant quantity (6.4), which has been properly called the **"atomic heat."** Thus, taking the specific heats of iron, lead and mercury, respectively, as 0.1190, 0.0305 and 0.0333, gives the value for the atomic heat in each case as follows:

	At.Wt.		Sp.Ht.		At.Ht.
Iron,	55.40	×	0.1190	=	6.59 heat units.
Lead,	205.44	×	0.0305	=	6.27 heat units.
Mercury,	198.40	×	0.0333	=	6.61 heat units.

The average value for the atomic heat of the elements may be taken as 6.4, though it is sometimes given as low as 6.25 (Remsen). **Atomic heat** may be briefly defined as the heat capacity of matter per unit-weight atom.

A **gram-atom** of any elementary substance is a weight of that substance, in grams, equal to the atomic weight of the element. Thus, the atomic weight of iron being 55.4 (H = 1), a gram-atom of iron is 55.4 grams of that substance; and its heat capacity is the atomic heat value (6.4 heat units).

This average value of **atomic heat** often assists the determination of the specific heat from the atomic weight of an elementary substance, or, vice versa, its atomic weight when the specific heat is known. For example, since the heat capacity of 55.4 grm. of iron is 6.4 heat units, the average specific heat of iron is $6.4 \div 55.4 = 0.1155$.

In like manner, a **gram-molecule** of any compound substance is a weight of that substance, in grams, equal to the molecular weight of the substance.

Calculation of Density—The elements form the basis of all relative measurements with respect to volume, density and weight. For example, the density of air, referred to hydrogen as unity (H = 1), can be calculated from the relative weights and volumes of oxygen and nitrogen, which are the chief constituents of air. The composition of pure air, by volume, is practically, oxygen (O) 20.9 per cent., nitrogen (N), 79.1 per cent. Then, since the atomic weight of oxygen is 16 and that of nitrogen 14, the relative weight of 100 volumes of air, referred to hydrogen as unity, is found as follows:

Oxygen, $20.9 \times 16 = 334.4$
Nitrogen, $79.1 \times 14 = 1107.4$
Air, 100 vol's $= 1441.8$

Therefore, one volume of air is $1441.8 \div 100 = 14.418$ times as heavy as the same volume of hydrogen; or, the density of air referred to hydrogen is 14.418.

The percentage composition of pure air, by weight, is readily calculated from the above figures; thus:

Oxygen, $\frac{334.4 \times 100}{1441.8}$ = say 23.2 per cent.

Nitrogen, $\frac{1107.4 \times 100}{1441.8}$ = say 76.8 per cent.

The Coal Age Pocket Book

Transmission of Heat—The condition known as "heat" is transmitted in any one of the three following ways: 1. By **radiation.** 2. By **conduction.** 3. By **convection.**

Heat is radiated in straight lines in all directions from its source and is then called "radiant heat." It is transmitted through the vibrations of the ether that fills all space and the radiated heat is imparted in varying degree to all matter in its path. Heat so imparted to a body is said to be "absorbed" by the body.

When heat travels through a body the process of transmission is known as "conduction." Heat thus spreads throughout the **mass of a solid.**

The spread of heat **in any fluid** (liquid or gas) is through the circulation caused by the unequal distribution of the heat. This mode of transmission is known as "convection."

Measurement of Heat—Although heat, as already explained, is a **condition of matter** and not a tangible quantity, it is possible to measure its intensity or degree through the effect it produces, referred to certain established **standards of measurement.** The most convenient standard is the heat energy that will cause a rise of one degree in the temperature of a unit weight of pure distilled water at its point of maximum density. This is called a "heat unit" or "thermal unit" and is a quantity capable of exact measurement.

Heat or Thermal Units—There are several heat units in common use, the principal ones being the British unit and the French unit. A third unit that is largely used combines these two units.

The British Thermal Unit—The British thermal unit (B.t.u.) is the quantity of heat required to raise the temperature of 1 lb. of pure distilled water at maximum density, 1 deg. of the Fahrenheit scale.

The French Thermal Unit or Calorie—This is the quantity of heat required to raise the temperature of 1 kg. of pure distilled water at maximum density, 1 deg. of the Centigrade scale.

The Pound Calorie—This is the quantity of heat required to raise the temperature of 1 lb. of pure distilled water, at maximum density, 1 deg. of the Centigrade scale.

Conversion Formulas—

B.t.u.	×	0.252	=	Calories
B.t.u.	×	5/9	=	Pound-calories
Calories	×	3.968	=	B.t.u.
Calories	×	2.2046	=	Pound-calories
Pound-calories	×	9/5	=	B.t.u.
Pound-calories	×	0.4536	=	Calories

Note—Since 1 lb. (avoirdupois) = 0.4536 kg.; and
1 deg. (Fahr.) = 5/9 deg. (Cent.),
1 B.t.u. = $0.4536 \times 5/9 = 0.252$ cal.
Again, since 1 kilogram = 2.2046 lb. (avoir.); and
1 deg. (Cent.) = 9/5 deg. (Fahr.),
1 cal. = $2.2046 \times 9/5 = 3.968$ B.t.u.

These simple calculations show the derivation of the constants used in the above formulas.

Inquiries of General Interest

Rail vs. Water Freights to the Pacific Coast

Some time in the near future the coal operators in the Middle West will have a chance to suggest to the railroads the advisability of their making a reduction in freight rates from Wyoming and Utah points to the Pacific Coast, so as to enable the coal here to compete with shipments of coal on the Atlantic Coast now passing through the canal and destined for Pacific Coast points.

From this inland locality it is very hard to obtain authentic information in regard to the shipping of coal by water, and it has occurred to me that COAL AGE might furnish the coal operators in this section with some general information in regard to the cost of shipping coal through the canal that would be of value in the solution of this problem. Any information you can give that will assist us in obtaining an equable adjustment of this important matter will be greatly appreciated.

H. C. MARCHANT,
Sales Manager, Lion Coal Co.

Ogden, Utah.

[Since the opening of the canal the problem presented in the above inquiry has been of growing importance to shippers throughout the Central Basin and Rocky Mountain Districts. The next issue of COAL AGE will contain Letter No. 1, discussing the important features involved. Let others follow.—EDITOR.]

※

Coal Seams in Indiana

Can you inform me how many workable coal seams there are in the State of Indiana, giving the names of the different seams?

J. MCMILLAN.

Clinton, Ind.

The workable seams of coal in Indiana vary, in the different counties of the state, from 2 to 18 in number and from 2 ft. 8 in. to 10 ft. 2 in. in thickness. A chart of the Indiana coalfield, prepared by Edwin F. Lines, shows a vertical section through the coal measures. The various coal beds or seams in this section are numbered from the bottom upward as Coal 1, 2, 3, 3a, 4, 4a, 5, 5a, 6, 7 and 8. These practically include all the workable seams in the state. The two lowermost of these divisions, however, are subdivided and described as Cannelton, Lower Block, Upper Block and Minshall coal. The uppermost division of the measures (Coal 8) is not workable.

To summarize these remarks, it may be stated that there are practically nine workable seams in the state; namely, counting from the bottom of the measures, the Cannelton, Lower Block, Upper Block, Minshall and seams 3, 4, 5, 6 and 7 previously mentioned. The celebrated block coal of Indiana predominates in Clay County; the Minshall coal is worked principally in Clay, Daviess, Parke and Fountain Counties. The Upper and Lower Block seams vary from 3½ to 4½ ft. in thickness, while the Cannelton coal has an average thickness of 3 ft. and the Minshall coal varies from 3 ft. to 5 ft. 6 in.

The table gives some interesting data in regard to Indiana coal seams and their estimated tonnage:

TABLE SHOWING THICKNESS AND EXTENT OF COAL SEAMS AND DISTRIBUTION BY COUNTIES

County	Number of Seams	Maximum Thickness of Single Seams		Maximum Total Thickness of Seams		Maximum Total Thickness Workable		Total Coal Area	Workable Coal Area	Estimated Total Tounage of Coal	Estimated Tonnage Removed or Unworkable	Estimated Tonnage Available
		Ft.	In.	Ft.	In.	Ft.	In.	Sq. Mi.	Sq. Mi.	Million Tons	Million Tons	Million Tons
Clay	16	9	0	27	0	19	0	250	100	1200	70	300
Crawford	3	4	0	4	0	2	6	12	..	10	0.15	0.4

Parke	11	7	6	35	0	24	0	470	100	1000	30	435
Perry	7	5	8	8	0	3	0	30	6	36	3.5	9
Pike	13	10	2	20	0	13	0	330	200	2000	20	650
Posey	11	6	0	25	0	17	0	420	200	2000	..	500
Putnam	2	3	0	5	0	5	0	100	1	50	0.4	2
Spencer	11	5	10	20	0	13	0	300	24	1000	0.3	50
Sullivan	18	9	0	40	..	28	0	440	365	10,000	50	4000
Vanderburgh	10	4	6	18	0	12	0	240	200	2000	25	1000
Vermillion	12	7	0	35	0	22	0	250	200	1500	30	600
Vigo	18	7	6	43	0	33	0	400	300	4000	50	1500
Warren	4	4	2	9	0	7	0	300	30	500	0.6	50
Warrick	12	9	0	25	0	19	0	356	175	2000	10	500

The seams attaining a thickness of 6 ft. and over in the state are as follows: Seam, 3, having a thickness of 7 ft. 6 in. in Greene, 7 ft. 4 in. in Vigo, 7 ft. in Clay and 6 ft. 6 in. in Sullivan Counties; seam 5, having a thickness of 8 ft. in Clay, 7 ft. in Pike, Knox and Warrick Counties, 6 ft. 10 in. in Sullivan and Gibson Counties and 6 ft. in Greene and Daviess Counties; seam 6, having a thickness of 6 ft. 6 in. in Sullivan; and seam 7, having a thickness of 6 ft. in Vigo County.

※

Sampling Coke

What are the important points in the sampling of a consignment of coke for the purpose of determining its fuel value for power purposes, and how does the sampling of coke differ from that of coal?

FUEL INSPECTOR.

Chicago, Ill.

The quality of coke is much more uniform than that of coal, owing to the process of crushing and mixing the coal before coking. A smaller sample of coke is therefore required. The appearance of the coke, unlike coal, furnishes no index of its quality in respect to the percentage of ash, sulphur or phosphorus, which must be determined in the laboratory. The bright silvery luster and the dark discoloration are alike the results of the burning. It is well, however, to select as samples the long slim pieces as better representing the oven charge from top to bottom.

Examination Questions

Montana Mine Foremen's and Firebosses' Examination Held at Red Lodge June 8-10, 1915

(*Selected Questions*)

Ques.—If 13 cu.ft. of air, at ordinary temperature and pressure, weighs 1 lb., how many tons of air are passing through a mine in 8 hr., where the current measures 52,000 cu.ft. per min.?

Ans.—Assuming that the temperature and pressure in the mine are the "ordinary temperature and pressure" mentioned in the question and that the mine air weighs 1 lb. for each 13 cu.ft., the weight of air passing through the mine in 8 hr. is

$$\frac{52,000}{13} \times \frac{1}{2000} \times 8 \times 60 = 960 \textit{ tons}$$

Ques.—Where are gases found in mines, and how are they produced?

Ans.—The common mine gases occur in largest quantity, in a properly ventilated mine, at or near the points where they are generated; but in a poorly ventilated mine these gases may accumulate in considerable quantities in void or abandoned places where they have found their way, or at the face of rise or dip workings where they accumulate by virtue of their densities. Those gases *lighter* than air find their way naturally to the rise workings and cavities in the roof or above the falls, while those *heavier* than air gradually sink to the floor and other low places in the mine, such as swamps and dip workings. The hydrocarbon gases, as methane, olefiant gas to some extent, and ethane, which is frequently associated with methane, are confined in the natural strata known as the "coal formations" and issue from the strata into the mine workings.

Carbon dioxide is produced in the complete combustion of coal and other carbonaceous matter in the mine. These forms of combustion are continually occurring in the breathing of men and animals, burning of lamps and the slow combustion of fine coal and slack in the waste places of the mine.

Carbon monoxide is produced largely by the explosion of powder and the combustion of carbonaceous matter in a limited supply of air.

Sulphureted hydrogen, when found in mines, is usually the result of the action of water on pyrites (FeS_2) so often associated with the coal.

Ques.—How are gases caused to expand out of the strata and at times to overflow the workings of a mine?

Ans.—The gases occluded in the coal formations exist there under more or less pressure. It may not be thoroughly understood what actual causes produce the outflow of these gases from the strata. Undoubtedly, the pressure under which the gases are occluded plays an important part in their emission. It is probable, also, that the diffusive action known as "osmose" by which gases pass into each other through a porous medium, plays an important part in the escape of the occluded gas through the pores of the coal.

What is known as an "outburst" of gas from the strata is the result of the accumulation of occluded gas in crevices and other void places in the strata, under great pressure. This pressure is thus distributed over a considerable area and is often sufficiently great to break down the coal at the face of the workings or to heave the floor of the mine or cause a heavy fall or roof, according as the gas is confined in the underlying or overlying strata of the seam. At other times, such accumulations of gas in the strata find their way into the workings through a crevice or drillhole, and this is known as a "feeder" of gas or "gas feeder."

Ques.—What is firedamp?

Ans.—The term "firedamp," in this country, is applied to any inflammable or explosive mixture of methane and air, with or without other gases. A simple mixture of methane and air, in proportions that are not inflammable or explosive, cannot properly be termed firedamp, although the term is often taken to mean *any* mixture of methane and air.

Ques.—What percentage of firedamp is most dangerous?

Ans.—When the proportion of air to gas is such that the mixture is above the maximum explosive point, the danger is greater than when the proportion of gas is less than what marks this point. The reason is that when a larger proportion of gas is present any addition of air, which is liable to occur in the mine at any time, will render the firedamp mixture more explosive. In other words, the addition of fresh air to a firedamp mixture *above* the maximum explosive point will increase the explosiveness of the mixture until that point is reached, after which the further addition of air will decrease its explosive condition.

Ques.—What effect would carbon dioxide (CO_2) have on marsh gas (CH_4) when these are mixed together?

Ans.—The mixture of carbon dioxide with marsh gas will have no effect on the gas itself; but when carbon dioxide is added to a mixture of marsh gas and air (firedamp) the effect is to reduce the explosive condition of the mixture. It is estimated that when a firedamp mixture is at its most explosive point, the addition of one-seventh of its volume of carbon dioxide will render the firedamp inexplosive.

Ques.—A current of 3000 cu.ft. of air and gas is at the explosive point. How much fresh air must be added to prevent a cap?

Ans.—Assuming the question refers to the *maximum explosive point,* the quantity of gas in this current is $3000 \times 0.0946 = 283.8$ cu.ft. per min. Now, assuming a flame cap first appears when 2 per cent. of gas is present, the total circulation is $283.8 \div 0.02 = 14,190$ cu.ft. per min. The required addition of air is then $14,190 - 3000 = 11,190$ cu.ft. per min.

Coal and Coke News

Washington, D. C.

The text of the decision of the Supreme Court of the United States in the so-called Commodity Clause case affecting the Delaware, Lackawanna & Western R.R. and its affiliated coal concern, has been made available within the past few days and apparently brings one phase of the litigation in question to a definite conclusion. (No. 517, October term, 1914; U. S. appellant vs. D., L. & W. Ry. Co., and D., L. & W. Coal Co.) The case is moreover of special interest because of the conflicting decisions that have heretofore been rendered with reference to the working of the so-called Commodity Clause in the Interstate Commerce Act, under which it was made unlawful for a railroad company to carry on any business not connected with transportation, and thus makes a detailed review of the case worth while at this time.

The act of 1906 made it unlawful for carriers to haul their own coal beyond the limits of the state in which they were located; and, desiring to continue the business of mining and transporting coal, the Delaware, Lackawanna & Western R.R. Co. adopted a plan under which it was to make a sale and divest itself of title to the coal, at the mouth of the mines, before transportation began.

Accordingly it caused to be incorporated, under the laws of New Jersey, the Delaware, Lackawanna & Western Coal Co. with a capital stock of $6,800,000,—divided into shares of $50 each. The railroad company then invited its own stockholders to subscribe to the capital stock of the coal company at the rate of one share of the latter for each four shares of the former. Ninety-nine per cent. of these stockholders did, as was expected, subscribe for the stock of the coal company—their subscriptions being paid for in full out of a cash dividend of $13,600,000 previously declared by the railroad company.

The new corporation was then organized by electing the vice-president of the railroad company as president of the coal company, while other officers and directors of the coal company were also officers and directors of the railroad company.

As soon as the organization was completed, the railroad company prepared and submitted to the coal company a contract by which the railroad company, reserving what it needed for its railway locomotives, "agreed to sell and the coal company agreed to buy, f.o.b. the mines, all coal which, during the term of the contract, the railroad company should produce from its own mines or purchase from any one else." The price for prepared sizes—the more important commercial coal—was fixed at 65 per cent. of the price in New York on the day of delivery at the mines. The railroad company also leased to the coal company all its trestles, docks and shipping facilities.

Both Companies Signed Contract

The contract—thus prepared by the railroad company—was then signed by both corporations and, on Aug. 2, 1909, the coal company took possession of the leased property; those who had been agents of the railroad in its sales department became agents of the coal company in its sales department, and the two corporations, with managing officers in common, also had offices in common in the City of New York.

Thereafter the railroad company continued its mining business, annually producing about 7,000,000 tons and purchasing about 1,500,000 tons from operators whose mines were located on its railway. After retaining what was needed for use on its railway engines, it sold the balance, aggregating about 7,000,000 tons, to the coal company at the contract prices, f.o.b. the mines. The coal thus sold by the railroad company was then transported by it to destination where it was delivered to the coal company which paid the regular tariff freight rate and the contract price on the 20th of each month. This course of dealing continued until February, 1913, when the Government filed a petition, against both corporations, alleging that the two were practically one, and attacking the validity of the contract.

This particular case was appealed from the District Court of the United States for the District of New Jersey, where the decision has gone against the contention of the United States that such an arrangement as has thus been set forth was out of harmony with the provisions of the law. The decision of the court was based upon the view that the essential object of the commodity clause was to prevent railroads from occupying the dual and inconsistent position of public carriers and private shippers, and that it must be broadly interpreted in its application to the operations of the company with a view to finding out whether given practices are or are not inconsistent with the attainment of such an object.

Without going into the technical legal analysis of the various aspects of the contract between the railroad company and the coal company, it is worth while to note the position taken by the two companies in general terms.

The Contract Carried Unusual Provisions

The most cursory examination of the contract shows that—while it provides for the sale of coal before transportation begins—it is coupled with onerous and unusual provisions which make it difficult to determine the exact legal character of the agreement. If it amounted to a sales agency the transportation was illegal because the railroad company could not haul coal which it was to sell in its own name or through an agent. If the contract was in restraint of trade it was void because in violation of the Sherman Anti-Trust Law. The validity of the contract cannot be determined by consideration of the single fact that it did provide for a sale. It must be considered as a whole and in the light of the fact that the sale at the mine was but one link in the business of a railroad engaged in buying, mining, selling and transporting coal.

The court further finds that the provision in the contract whereby the railroad was able to dictate to whom the coal should be sold even at unprofitable prices, was also objectionable from the standpoint of the law, while various other elements contained in it practically made it an instrument of monopoly. The contract, therefore, violated not only the commodity clause of the Interstate Commerce Act, but also the Sherman Anti-Trust Law in the consequent conclusion.

Particularly in its application to the railroad business, the decision makes clear that such a company if it continues in the business of mining, must absolutely dissociate itself from the coal before the transportation begins. It cannot retain the title nor can it sell through an agent. It cannot call that agent a buyer while so hampering and restricting such alleged buyer as to make him a puppet subject to the control of the railroad company.

If the railroad sells coal at the mouth of the mines to one buyer or to many, it must not only part with all interest direct or indirect in the property, but also with all control over it or over those to whom the coal is sold at the mines. It must leave the buyer as free as any other buyer who pays for what he has bought.

It should not sell to a corporation with officers and offices in common—for the policy of the statute requires that instead of being managed by the same officers, they should studiously and in good faith avoid anything, either in contract or conduct, that remotely savors of joint action, joint interest or the dominance of one company by the other. If the seller wishes—by a lawful and bona fide contract, whose provisions as to delivery and otherwise are not in restraint of trade—to sell all of its coal to one buying company, then that one buyer can be bound by reasonable terms and required to pay according to the contract.

PENNSYLVANIA

Anthracite

Pottsville—Evidently the officials of the United Mine Workers of America are beginning a campaign to instill enthusiasm in the miners of the anthracite region in anticipation of the new agreement which it is expected will be entered into at the expiration of the present arrangement on Mar. 31, 1916. Announcement has just been made that John P White, president, will visit the Panther Creek Valley during July and deliver addresses in various mining towns and communities.

Shenandoah—William Singmaster, aged 34 years, was killed, and Michael Heiser, Edward Ressinger and Charles Slaterbach, so seriously burned that their recovery is doubtful, by a gas explosion in the Potts Colliery. The material damage to the mine was also considerable, as the force of the explosion was great, tearing out the mine props and roof supports.

Wilkes-Barre—The Anthracite Conciliation Board has been taking testimony here on an appeal made by the United Mine Workers employed at Hazleton in the operations of the Lehigh Valley Coal Co. and Cox Brothers. The miners state that union pumpmen and firemen have been suspended due to short working time and their places taken by monthly salaried employees, such as bosses, foremen and clerks. Decision has been reserved.

Bituminous

Waynesburg—There will be offered for sale in front of the Greene County courthouse on Saturday, July 15, at an administratrix' sale, 186.17 acres of land, together with all mining privileges without restrictions as to the support of the surface. The land is located in Franklin Township, Greene County, Pennsylvania.

Uniontown—Orders to fire 770 more ovens of the H. C. Frick Coke Co. have been issued. The plants affected are: Wynn, 170, after a year's idleness; Bridgeport, 100, idle for about 8 months; Lemont No. 1, 160, idle for almost a year; Brinkerton, Buffington, Colonial No. 1, Continental No. 1, Edenborn, Hecla, Lambert, Leisenring Nos. 1, 2 and 3, Leith, Redstone, York Run, Youngstown, Hostetter, Whitney and Trotter. The latest order places Continental No. 1 and Leith on a capacity basis.

Marianna—Resident Manager Harris Booker of the Marianna mine of the Pittsburgh Buffalo Coal Co. has issued a call for hands to resume operations in this mine. Between 200 and 300 men will be employed. The mine reopened June 21 and prospects are bright for steady work. Good houses are located at the mine and these will all be rented to the men that secure work.

Johnstown—An abandoned mine probably more than 100 years old, in which timbers covered with water are becoming petrified, has been discovered, it is said, by Thomas Leahey, a well-known coal operator, in opening a small private mine on his property at Cassandra. The oldest residents of this section cannot recall such a mine and it is believed that it was opened before the days of the Old Portage. The heading is said to extend about 500 ft. The surface of the coal indicates that picks were used and that no dynamite or powder was employed. Heavy square timbers were used such as are now employed for lagging a drift. The timber, because of the fact that the mouth of the mine has been closed up and the air shut off, has become so hard that it turns the edge of an axe. Inside the mine was a small mine car that would hold about four bushels of coal. The car is of wood and has wooden wheels. The tires were made of strap iron nailed to the wheels. There were no tracks but heavy planks were doubtless used to guide the car which was probably pushed by hand.

Simpson Station—The Union-Connellsville Coke Co. has fired 100 ovens at its Katherine works at Simpson Station, about three miles above Brownsville, on the Monongahela railroad. The plant has been idle since Jan. 14, 1914. Within the next month the company expects to have the entire plant fired in full, with the expectation of steady work for a long time. It has secured a big contract.

Connellsville—Shipments of coke from the Connellsville region recently rose to 351,000 tons per week, with production at 348,000 tons, thus establishing a new high record for the year. Compared with the previous week this showed an increase in shipments of 19,000 tons. More ovens are constantly being put in service throughout the Connellsville region.

VIRGINIA

Raven—The Raven Red Ash Coal Co., located at Raven, on the Clinch Valley branch of the Norfolk & Western R.R., is installing a coal washer to wash its slack. This firm is mining the Lower Banner seam of coal, which carries a soft fire clay or draw slate above it. This comes down and breaks up, mixing with the coal, making it necessary to wash the slack in order to clean this product.

WEST VIRGINIA

Dubree—The Rothwell Coal Co. is opening a new mine on the north side of the creek about half a mile from the old one. A bed of coal over 4 ft. in thickness has been opened and there is every prospect that the operation will be a profitable one. Fifteen hundred feet of railroad is being built to the new mine.

Ethel—Six hundred miners are working in the operations of the Logan Mining Co. and the Ethel Coal Co. at the present time, which is a larger force than has been at work for more than a year. It is believed that the present boom is the beginning of a revival which will be of considerable extent. During the past year only about 200 miners have been employed at Ethel, and these in many instances were working only part time.

Williamson—On Saturday, July 10, at 10 o'clock a.m., at the front door of the Mingo County Court House, the plant and equipment of the Mingo Washed Coal Co., consisting of a lease for coal-mining purposes containing 588⅔ acres, situated at Ajax Siding in Hardee District, Mingo County, with 13 miners' houses, one bungalow, a clubhouse, store and office building, also powder house, washer, tipple and a considerable amount of machinery, such as engines, generator, switchboard, boilers, pumps, a coal washer with machinery installed, coal-cutting machines, etc., will be offered for sale at public auction. Full information may be secured on request from M. T. Persinger, trustee of the estate of the Mingo Washed Coal Co.

KENTUCKY

Hazard—The Harvey Coal Co. headquarters, Knoxville, Tenn., announces that it will be ready to begin shipping coal from the First Creek territory within the next 30 days. Already mining work is well under way.

Jenkins—The Consolidation Coal Co. announces increases in its Jenkins-McRoberts plants, owing to recent big orders aggregating several hundred thousand tons. The Elk Horn Mining Corporation in the Fleming field also has some good orders. Several hundred additional miners have gone to work in both plants.

Central City—Additional resolutions, condemning violence, which has been more or less prevalent in Ohio County, were adopted by farmers and miners assembled at a mass meeting near Williams' mines in Ohio County recently. Robert Pollock, president of District No. 23, United Mine Workers of America, presided, stating that the object of the meeting was to demonstrate to the public that the union men were against lawlessness. He read a resolution which had been prepared condenmning the outrages and pledging the miners and farmers to law and order.

OHIO

Stewartsville—The Franklin Coal Co. mine recently resumed operation with a small force of men. It will be several weeks before the company has all its employees busy, but when running full time this mine employs 200 men.

Shadyside—James and Patrick Cook, of Fairmont, W. Va., are making repairs to the Wegee mine, south of Shadyside. This mine has not been operated for three years and is in a bad condition. The old tipple and some of the other buildings have been taken down, and it will probably take some months to rebuild the plant and clean up the mine.

Warsaw—The Ohio Cannel Coal Co. has opened its mines near Warsaw after an idleness of more than two months.

Columbus—So far no legal action has been taken against the Piney Fork Coal Co. of Columbus, which is preparing to open a stripping operation in Jefferson County, Ohio. A newspaper in Steubenville is aroused over the project and is urging the county officials to stop the work by means of an injunction. It is apparently working for the miners' organization. J. W. Blower, of the company, does not anticipate any trouble. He is working to get things in shape for the delivery of the huge steam shovel some time in July.

INDIANA

Boonville—The Center Mining and Coöperative Association recently organized by the Hackett Mining Co., has started operation of the Hackett mines, with 50 operatives. The directors of the corporation are Robert Madden, Fred Geyer, Charles Wilder, Roscoe Scott and Bert Pursinger.

Evansville—The Supeiror Court here declined to appoint a receiver for the Vanderburg County Mining Co., as petitioned.

Princeton—A strike of 300 miners at the Princeton mine ended when the company returned to the old method of loading the men into the cage. The company had tried the chute plan, which, it asserted, was safer, but the employees held that it was more dangerous and in addition, contrary to law.

Kokomo—William F. Smith, representing the Inland Coal Co., has purchased the Domestic Block Coal Co.'s mines near Brazil, Ind., from the receiver, for $5000, the creditors' claims being $10,000.

ILLINOIS

New Baden—Engineers of the Southern Coal and Mining Co., in drilling for water, with the hope also of striking oil, at the Little Oak Mine, west of here, found three veins of good coal, one at a depth of 115 ft., the second at a depth of 210 ft. and the third at a depth of 314 ft. The upper vein was 6 ft. in thickness. The two lower beds were only 3 ft. in thickness but the coal was of excellent quality. This is the first time that three coal measures have been found in this section. No oil was struck, although a well was bored to the depth of 746 ft. The primary purpose of obtaining a good supply of water was accomplished.

Belleville—A case of great importance to coal operators, originating here, has just been decided by the United States Supreme Court, which declares it is the duty of a railroad to supply cars when ordered by an operator for the transportation of coal and holds the railroad company liable for damages incurred by the operator through the failure of the railroad company to provide cars. The suit was brought in the St. Clair County Court at Belleville by the Mulberry Coal Co., of Freeburg, against the Illinois Central R.R. Co. to recover damages for the failure of the railroad to furnish cars to the company's mine, located near the road, pursuant to the demands of the mining company. It was based on the failure of the railroad company to furnish cars to the mine on certain days in 1907. A jury in the Circuit Court gave a verdict in favor of the mining company for $716.92. The railroad carried the case to the Illinois Supreme Court, which affirmed the decision of the Circuit Court, and then to the United States Supreme Court, which has now also decided in favor of the mining company. The decision by the highest court of the land that railroads must furnish cars when asked or pay damages is regarded by mining men as one of the greatest victories ever gained. Attorney A. B. Ogle, of Belleville, who with attorneys William Winkelmann and James O. Miller, presented the mining company's side of the case to the Supreme Court, says nation-wide interest has been manifested in the outcome. He has had inquiries concerning the case from Pennsylvania, Kentucky and other mining states.

Pana—Because the mine of the Pana Coal Co., one of the oldest and largest in the state, constructed at an original cost of more than $200,000, brought only $30,000 at a master's foreclosure sale recently, which was insufficient to pay the fees and certificates of the receivers, Judge McBride, in the Circuit Court, set aside the sale and ordered a readvertising and sale of the property.

PERSONALS

Edward Page was recently elected vice-president of the New England Coal & Coke Co. at a meeting of the directors.

John K. Oliphant, president of the Oliphant-Wasson Coal Co., recently purchased the old site of the First National Bank in Vincennes, Ind., where he will erect an eight-story office building.

David A. Thomas, the Welsh coal magnate, was recently appointed by David Lloyd George minister of munitions, to go to the United States to supervise the making of munition contracts in this country and Canada.

W. H. Glasgow, for many years assistant to the general superintendent of the H. C. Frick Coke Co., has been appointed assistant general superintendent. This position was held for some years by Clay F. Lynch prior to his taking charge of the Bunsen Coal Co.'s operations seven years ago.

J. H. Wood, who has been western sales manager of the Davis Colliery Co., with headquarters in Columbus for the past two years will leave July 1 to be succeeded by Maury Robinson, formerly in charge of the local office. Mr. Robinson is the son of Neil Robinson, a well-known coal man of West Virginia.

J. L. Rogers, general manager of the Lamb Coal Co. for the West Virginia capitalists who recently purchased the property, will assume the duties of the office when he relinquishes management of the Muhlenberg County Savings Bank to the First National Bank which has absorbed it. J. C. Saunders, of Premier, W. Va., is president of the new company.

Col. Richard Coulter was recently elected president of the Keystone Coal & Coke Co. to succeed the late Col. L. B. Huff. Colonel Coulter has been connected with the company as vice-president for several years. Julian B. Huff, of Greensburg, and Robert K. Cassatt, of Philadelphia, were elected vice-presidents of the company at the same meeting of the directors.

Rodman Wanamaker, who has for many years been actively associated with the mercantile interests of his father, John Wanamaker, has been elected to the board of the Lehigh Coal & Navigation Co. In addition to his activities as a merchant he is closely connected in financial circles, being at this time vice-president and a director in the West End Trust Co. and a director in the First Penny Savings Bank, of which John Wanamaker is president.

T. J. Mitchell, general manager of the Allegheny Coke Co. on returning to his home in Uniontown, Penn., announced that this firm's plant in Pike County, Kentucky, would resume operations on July 1 after an idleness of six months. One hundred and fifty rectangular ovens will be fired the first of the month to fill an order for 10,000 tons per month. The coke manufactured by the Allegheny Coke Co. is similar to Connellsville coke and the prices are about the same.

H. B. Dunham, who has been connected with the traffic department of the Hocking Valley Ry. Co. for 23 years retires from active work July 1 to be succeeded by H. Q. Wasson, who has been his assistant. Mr. Dunham does not resign but is retained in an advisory capacity. The position of traffic manager is abolished and Mr. Wasson will report directly to M. J. Caples, vice-president. Mr. Dunham is one of the best known traffic men in the country. Ill health is the reason for his retirement.

OBITUARY

John W. Moyer, a retired contract miner, died in Shenandoah, Penn., on June 25. He was 74 years old. During the early 60's Mr. Moyer took a prominent part in the development of some of the largest operations in the Schuylkill District.

Mine Foreman J. B. Kirkpatrick, of Johnstown, Penn., was instantly killed recently when he went to the rescue of a miner who had grasped a live electric wire. Kirkpatrick received the full force of the current through the body of Lotsi Solders, the miner, who was only slightly burned.

John H. Ross, superintendent of the Superior Coal Co. at Gillespie, Ill., died at his residence on June 23, at the age of 36 years. Funeral services took place from the residence under the auspices of the Masonic Lodge and at the Lutheran Church under the direction of Rev. L. Krekler. Interment was made at Gillespie Cemetery.

INDUSTRIAL NEWS

Philadelphia, Penn.—On Sunday, June 20, the steamer "City of Taunton" ran into and sunk the coal barge "Solace," The loaded barge was at anchor when struck by the steamer. Fortunately the "City of Taunton" was enabled to rescue all of the crew.

Philadelphia, Penn.—Private advices received here give the information that the British steamer "St. Joseph," which left here with a cargo of coal a few days ago, caught fire at sea. The fire started in the cargo, but fortunately was confined to two of the holds and the vessel was not damaged.

Columbus, Ohio—All of the sales force of the Sunday Creek Coal Co., in charge of P. A. Coen, general sales manager and George F. Schwartz, assistant, inspected the San Toy and Congo mines of the company, following their attendance at the annual meeting of the Michigan-Ohio-Indian Coal Association.

Pittsburgh, Penn.—Shipments of coal and coke over the Pennsylvania R.R. east of Pittsburgh and Erie for the month of May amounted to 5,238,504 tons, an increase of 90,838 tons compared with the corresponding month of last year. From Jan. 1 to May 31, the shipments totaled 25,185,931 tons, or a decrease of 2,227,749 tons in comparison with a corresponding period of 1914.

Winchester, Ky.—Steel rails for the branch coal road up First Creek from the Lexington & Eastern Branch of the L & N. are being laid and construction is progressing. Two negroes owners of a tract near Hazard, have sold it for $60,000. Two years ago the same land could have been purchased for $5 an acre. A syndicate headed by C. G. Bowman made the purchase.

Philadelphia, Penn.—A prominent financial house has compiled figures bearing on the amount of money sent out of the country by foreign mine workers in the anthracite region. This statement shows that for the six months following the declaration of war the alien workers have been prevented from sending $10,000,000 as compared with the amount sent during the six months prior to the start of the European conflict.

Camden, N. J. — The New York Shipbuilding Co. is now building on account of West Virginia coal interests two 9000 ton steamers for the export coal trade to Mediterranean ports. The boats will be managed by the Crowley firm of Boston and will be of the same type as the colliers "Lingan" and "Hochelaga," built, in England, especially for the St. Lawrence coal trade. These boats have machinery amidships but are not self-trimmers.

Brilliant, Ohio—The property of the Dexter Coal Mining Co., located at Brilliant, Ohio, is to be sold at 1 p.m., July 30, upon the order of Judge Sater in the federal court. The court set $15,000 as the lowest price to be accepted. J. C. Ault is receiver for the Dexter Coal Mining Co. and will conduct the sale. The sale of the property was ordered at the instance of the Pittsburg-Buffalo Coal Co., which is named as plaintiff in the proceedings.

Ensley, Ala.—It has been announced by officials of the Tennessee Coal, Iron & R.R. Co. that No. 5 Blast Furnace at Ensley is being prepared to be put in operation within a short period. When this furnace goes into blast all six of the big iron makers at Ensley will be in operation for the first time in many months. It is felt throughout this region that the greatest industrial section in the South is once more falling into the active stride which has made it a centre of prosperity during past years.

Washington, D. C.—The United States Supreme Court has not yet entered the final order compelling the actual separation of the coal properties of the Delaware, Lackawanna & Western R.R. Co. from the railroad proper. The Lackawanna officials consequently have not yet learned when they must reorganize to meet the dictates of the commodity clause of the Hepburn Act. Until this order is entered the Lackawanna will not state its plans for the future as regards the coal-distributing business.

Washington, D. C.—A long and short haul order was recently entered by the Interstate Commerce Commission benefiting the New York Central R.R. in the matter of bituminous and cannel coal from Pennsylvania mines to Rhode Island points. The Commission granted the application of the New York Central R.R. and announced that the road may establish a rate of $2.45 per ton of 2240 lb. on bituminous and cannel coal in car loads from Pennsylvania mines to Olneyville, Providence and Auburn, R. I.

Chicago, Ill.—The petition of the Consolidated Indiana Coal Co. and the Monon Coal Co. to the Interstate Commerce Commission to equalize the rate from the Sullivan-Linton coal fields to Chicago with that in effect from the Brazil-Clinton group—a difference of 10c. per ton existing—was refused in a recent decision rendered by the Commission. This decision is a great disappointment to the Sullivan-Linton operators, who had hoped to be placed in an equal position with the Clinton shippers in selling their coal in the Chicago market.

Cincinnati, Ohio—The Ohio River Board of Engineers met in the office of United States Division Engineer Colonel Henry Jervey recently for the purpose of preparing an estimate of the amount of money which will be needed during the fiscal year, ending June 30, 1917, for Ohio River improvements. The estimate will be forwarded to the Chief of Engineers at Washington for presentation to the next Congress. The amount necesary for continuing the improvement of the river by lock and dams and for general river improvement, etc., will probably approximate $10,000,000.

St. Louis, Mo.—The first coal was put into the ovens of the new $2,000,000 coke plant of the Laclede Gas Light Co. in Carondelet recently. Only 33 of the 56 ovens were started since the bringing in of all the furnaces must be done gradually and carefully because of the expansion that is caused by the heat. About 200 men are now employed at the plant. The coal used is brought by rail from Kentucky near the Virginia line. It is expected that a barge line will be established later for the more economical handling of the coal. The H. W. Warren Coke Co., distributers, is booking orders for delivery.

Fleming—The week ending June 26 was the largest in point of coal shipments in the history of the Elk Horn Mining Corporation in the Fleming-Haymond field. This field has only been opened about two years and business looks brighter now than ever before. Five mines are running night and day to keep the orders filled. Men are scarce and good coal loaders are in great demand. The Lexington & Eastern R.R. is keeping the sidings clear of standing coal only by an extra effort and long hours on the part of the train crews. It is expected another train will be put on soon to take care of the steadily increasing output of these mines.

Bluefield, W. Va.—It has been announced by officials of the Carolina, Clinchfield & Ohio R.R. that traffic will begin over the new extension between Elkhorn City, Ky., and Dante, Va., about July 1. By the completion of this road the coal fields of eastern Kentucky, including the Elkhorn and Boone's Fork in Letcher County, will be given a southern connection and an important one. Much of the coal from the plants around Jenkins will go over the new Clinchfield road. On the 32 miles of this road there are 26 tunnels, one of them, the Sandy Ridge, being nearly two miles long. The work of concreting this big tunnel from end to end has just been completed.

Lexington, Ky.—Following a meeting of the officers of the Kentucky River Coal Corporation, it was announced that contracts have been made with various operators on First Creek, about three miles from Hazard, Ky., for a minimum output of 550,000 tons of coal annually. The coal will be sent to the market over the Lexington & Eastern branch of the Louisville & Nashville R.R. A 5½ mile spur is being built up First Creek for the purpose of getting the coal to the main line. The Harvey Coal Co., and the Blue Diamond Coal Co. have begun operations and a Cincinnati syndicate of coal men has taken a lease and will operate a mine under a corporation not yet completely organized.

Martinsburg, W. Va.—The coal tonnage moved over the Baltimore & Ohio R.R. system for 11 months of the present fiscal year shows a decrease as compared with the previous 11 months. From July 1 to May 31, the road hauled 26,475,988 tons of coal, as compared with 32,036,361 tons for the previous 11 months. During September of last year 2,878,836 tons of coal were moved, while during February of the present year 1,906,210 tons were handled. These were the best and poorest months of the period. Coke tonnage for the 11 months totaled 2,660,391 tons, as contrasted with 3,714,534 tons for the corresponding period of the previous fiscal year, thus amounting to a reduction of 1,054,143 tons for 1915.

St. Louis, Mo.—R. W. Ropiequet, of Belleville, Ill., attorney for the St. Louis Coal Operators' Traffic Bureau, has filed an argument and brief with the Interstate Commerce Commission against proposed advances in coal rates from various points in Illinois. The proposed advances are declared to be discriminatory against the Illinois mines when compared with competing fields serving the same territory, and as against the coal traffic as compared with other traffic upon which no advances are proposed. Issue is taken with the contention of the carriers that the present coal rates are comparatively unremunerative and that the coal does not bear its just proportion of the burden of transportation. The brief maintains that the coal traffic is the most important factor in the production of increasing return for the carriers, that it is a remunerative traffic and that it contributes more to the burden of transportation than the average traffic. It is declared that the advances proposed would result in a greater tonnage from the eastern fields via Duluth, no advance in the rate from these fields having been proposed, and the result would be that coal from these fields would supplant Illinois coal.

Coal Trade Reviews

General Review

Anthracite market dull and discouraging. Bituminous outlook continues cheerful though current market is under heavy pressure.

The heavy pressure on anthracite is forcing the companies to make concessions in the way of long-term credits that will carry the retailers over until the coal begins moving out to the consumers in the fall. In fact the market is full of conflicting rumors and cross currents. There are many retailers who are confident they will be able to obtain low prices well into September, but there are other conservative observers who predict a tremendous rush for coal to make up the deficiency caused by the deferred buying this summer. Chestnut coal is under particularly heavy pressure. There is an unusual amount of this grade going into storage, and it would not be surprising to see some heavy cuts offered shortly. Still more drastic curtailment programs have been instituted, and the leading companies will practically discontinue operations entirely during the first week of this month. The anthracite market has resolved itself into a waiting game for the time being.

It has developed that there has been considerable quiet buying of bituminous at the recent low level, and the best informed operators are proceeding cautiously over commitments on new business while conservative buyers are showing more of a disposition to close. It is still evident, however, that the current situation is soft in spots. Some pressure is evident on Hampton Roads coal although recent dumpings have been exceptionally heavy, and the accumulation reduced to a more normal basis than for some time.

The stir in iron in the Pittsburgh District has created a better feeling in trade circles although there has been a tendency to place an exaggerated value on this. The current market fails to reflect any actual improvement while the Lake trade continues disappointing with reports of large stocks at the upper ports. The anticipated movement of large crops in the fall is the most encouraging feature in the current situation.

Although the Ohio trade is being heavily over-solicited, there is still evidence of an improved tone. Interest for the moment is centered on the stocking business, and the poor collections are interfering with this to some extent. Industrial conditions fail to show any improvement, but the threshing demand is becoming a factor in the situation, and there is some activity on negotiations for school contracts.

The Middle Western situation is still characterized by a general uncertainty. More inquiries are reported in some directions, particularly for future delivery, and if these materialize into actual business, production will have to be materially increased. Stocks are generally low, and there must be some buying developed before very long. The operators have the price situation well in hand, and there is not a great deal of price cutting. Screenings continue the strongest department of the trade.

A Year Ago—Heavy curtailment in the anthracite region marked the inception of the usual mid summer lethargy. Individuals are working full and forcing the market. Eastern soft-coal buyers fail to respond to unusually low prices, and trade devoid of further absorbing power. Western situation is developing a better tone.

BUSINESS OPINIONS

Boston News Bureau—The attention of leading financial interests today is focused chiefly on the efforts of foreign governments to establish a credit here in order to make payments for purchases of war supplies. It is little wonder that the situation is perplexing. People are awaiting some definite trend to affairs before expanding their commitments. So long as the foreign outlook remains so clouded general conditions will be unsatisfactory. Manufacturers of war supplies are busy and could be much busier if they were confident of receiving quick payment for their products. Until, therefore, the ways and means for these payments are found there will be more or less hesitancy in operations.

Engineering News—Contracting work has not been so active. There are a great many small jobs in prospect, but the larger jobs are being held up awaiting more definite news relative to financiering. At least one contract has been noted where the condition precedent to the beginning of the work was that the United States should not be at war on Aug. 1. The expected shortage of labor has not materialized as yet. There is considerable apprehension at the steel mills, but outside of one or two instances there has been no difficulty in securing all of the needed labor. Among contractors no difficulty has as yet been experienced in securing sufficient men to do the work. This applies to all classes of laborers. Several strikes have occurred, which indicates that labor is better employed.

Dun's Review—Cross currents continue in business channels, but the tide of returning prosperity is gradually rising. Good news still predominates and further progress is manifest, notwithstanding the unseasonable weather at many points, and especially in the West. It is like old times to hear of orders in excess of capacity in some instances, and the mills are being pushed to meet the heavy demands.

Bradstreet's—Trade news is irregular, current distribution being repressed, but, on the other hand, orders for future delivey tend to enlarge. Unseasonable weather hampers retail trade, results in forced sales, restricts sorting-up orders going to jobbers and detracts from crop promise.

The Modern Miller—In Oklahoma heavy rains have damaged considerable wheat. In the southern part of the state three-fourths of the crop is in shock; in central districts one-half, and in northern Oklahoma cutting is light. In Kansas rains and flooding have caused some loss. Prospects are not materially below June 1. Nebraska has prospect of a large crop. Some districts report fly damage. Heavy hail storms have been a feature. In southern Illinois and Indiana heavy rains and wind have leveled wheat and delayed cutting. Much ripe wheat will be cradled. Northern Missouri, central Illinois, central Indiana and Ohio have prospects of fine wheat crop, but the movement will be late.

Am. Wool and Cotton Reporter—The wool market was comparatively active during the past week. The general trend of the market is upward and there is a very optimistic tone.

Iron and Steel—Some business in the heavy lines has developed in the last week. The American Bridge Co. was low bidder on 24,000 tons of fabricated material for the approach to the "Free Bridge" at St. Louis. A contract has been closed for a bridge at Kansas City involving 5400 tons. A new freight station in Chicago will call for 12,000 tons and the new shops that are being built in all parts of the country are taking a great deal of material. It is said that the shipments of tin plates in June by the leading interest were larger than any month since February 1913. It is estimated that the unfilled orders of the United States Steel Corporation will show an increase of 200,000 tons in June. The Republic Iron and Steel is operating to 90% of capacity and orders are being received involving more tonnage than is being shipped.

ATLANTIC SEABOARD

BOSTON

Pocahontas and New River prices uneven, but nothing significant has developed. Georges Creek unchanged. Pennsylvania shippers find their situation improved. Water freights slightly firmer. Anthracite curtailment forestalls any great accumulation of domestic sizes.

Bituminous—While there is no significant price movement the general feeling is that the Pocahontas and New River situation will bear close watching the next month or so. There are still soft spots in the market f.o.b. but at this end there is practically no coal awaiting purchasers. It develops that there has been considerable quiet buying the past fortnight when concessions were being offered and on the whole prices are somewhat firmer at this writing. It will, however, take a material strengthening of the export market to bring about anything like a horizontal f.o.b. basis.

The uneven conditions at Hampton Roads piers with respect to coal standing are, of course, reflected in this market. Some of the agencies are pressing hard for business and others are holding aloof with a fair amount of current business on hand. The latter usually represent those shippers who have the more favorable connections with trade off-shore.

There are no new developments in Georges Creek. A large share of the output is still being reserved for export, chiefly on old sales, and only a minimum tonnage is coming forward to New England. So much business this year on this grade has been relinquished to the better known brands from Pennsylvania that it is probable that from now on Georges Creek will figure less and less in this territory.

Several of the Pennsylvania coals have made a good showing lately in the volume of coal placed and it is rumored some of the operators already have enough orders booked to leave them comfortable on a normal output the rest of the year. Prices are so far unchanged, but it is likely there will be a firmer tone in the course of a few weeks.

Water Freights are a little stronger than when last reported; 85c. is the current rate on large vessels, Hampton Roads to Boston, although a few steamers that are not at present available for traffic off-shore are accepting coastwise charters at 5@10c. less. Rates on Long Island Sound remain the same.

Anthracite—Shipments come forward very slowly. Curtailment is in effect in all parts of the region and little is now heard of any surplus in domestic sizes. The retail demand is beginning to start up but in view of the large stocks in New England there is not much prospect of any spurt to the wholesale demand until fall.

NEW YORK

Bituminous market experiencing one of its dullest periods though shipments are heavily curtailed and prices fairly steady. Anthracite consumers still holding off. Operations much reduced. Nut coal particularly long.

Bituminous—The export trade continues the big factor in the soft-coal market. While reports are heard from various sources of heavier demand for ordinary grades they always prove to be only flurries. The situation as a whole is in about the same condition as last week.

The market is experiencing one of its dullest periods. Fortunately operators are not flooding tidewater with coal, which enables wholesalers here to keep prices steady. There has been no material change in quotations for the past two or three months, although it has been possible for quick buyers to pick up stray cargoes at much lower figures.

There is little spot coal about the harbor and demurrage stock is not much in evidence. The mines are working about half time. Some operations with a good quality product are working nearly full time. Shippers have become reconciled to the situation and do not look for a better market until fall. Contract coals from the Southern ports are maintaining good prices.

Many new inquiries are reported by exporters with some contracts being closed. Much interest is being taken in the publication of the export statistics for June.

Current quotations continue about as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.30@3.40	$3.30@3.40	$3.30@3.40	$1.75@1.85
Georges Creek Tyson	3.00@3.10	3.00@3.10	3.00@3.10	1.45@1.55

Western Maryland		2.35@2.40	2.35@2.40	.80@ .85

Anthracite—It is a waiting game in the anthracite market. No improvement is looked for until fall. Everybody who cares to has full bins but there are many who are still buying from hand to mouth. This condition is partly due to the present situation where it is possible to buy certain individual coals at April prices. Some retailers are of the opinion that they will be able to duplicate these prices in September. Money is short with many.

Restriction continues to be the rule at the mines. Individuals are now working on about the same schedule as the companies—about half time with some doing a trifle better. The usual rush of orders in the last week of the month to save the ten cents per ton discount did not materialize in June. Nut coal continues the longest of the prepared sizes; some cargoes were reported as being picked up at $4.65. Egg and stove sizes are quiet but moving better than nut coal.

The curtailing of operations is having its effect on the steam coal situation. These sizes are not much in evidence but are plentiful. The better grades are mostly in demand. The buckwheats are dull. Some grades of No. 1 have been quoted at $2 but the average has been higher for the better free-burning coals. Quotations on Schuylkill district rice coal vary from $1.65 to $1.70.

Current quotations are about as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.85		$4.90	
Egg	5.10	$4.80	5.15	$4.85
Stove	5.10	4.80	5.15	4.85
Chestnut	5.35	5.00	5.40	5.05
Pea	3.35@3.50	2.70@2.95	3.40@3.55	2.75@3.00
Buckwheat	2.50@2.75	2.05@2.30	2.55@2.80	2.10@2.35
Rice	2.00@2.25	1.70@1.85	2.05@2.30	1.75@1.90
Barley	1.75@2.00	1.45@1.70	1.80@2.05	1.50@1.75

PHILADELPHIA

Anthracite market is conflicting; some report slight betterment and others only continued inactivity. Chestnut price predicted to slump. Pea still low, with doubts as to future. Bituminous export business growing, but domestic market inactive.

Anthracite—Conditions are so variable and conflicting that it is difficult to make an accurate analysis of the market. In the city proper the dealers have practically concluded that they are done until frost comes, while from the suburban section come reports that business is holding up fairly well. Most operators complain of an unusual dullness, but two of the large companies report their tonnage for the month to date slightly increased over the same period last year.

There are rumors that chestnut coal is becoming so inactive that an unusual amount is going into storage and price cutting on this size would not be at all surprising. Chestnut has been more or less inactive since stove coal practically took its place in the market by a rearrangement of the circular prices two years ago.

There have been some peculiar angles to the pea situation. Low prices continue to rule, with little tonnage absorbed, and there are some who are becoming doubtful of the ability of this size to regain the circular price of $2.50 even in the fall; big sales are reported at $2, protected beyond the first of the year. On the other hand another company asserts they have at no time sold pea at less than $2.10 and that they have such confidence in a good fall trade that rather than sell at below that figure they are now arranging to store this size at the mine.

Another concern is reported to be making large deliveries of steam coal to their consignees with the understanding that payment is only to be made when the coal goes to the consumers in the fall. This arrangement practically resolves itself into giving the operator storage room without the usual cost of storing and picking up.

Most of the collieries have continued on the three-day working schedule and it is likely that the working time for July will be even less. Starting with the close of work Wednesday, June 30, the mines will not open until Thursday, July 8, this arrangement being made to cover the usual idleness due to the celebration of the Fourth of July.

From the midst of all the conflicting conditions the one dominant note of optimism persists and that is—we are going toward an exceptionally good business in the fall.

The new circular prices for July are as follows:

	City	Tide		City	Tide
Broken	$3.30	$4.55	Pea	$2.50	$3.25
Egg	3.55	4.80	Buckwheat	1.25	2.25
Stove	3.80	4.80	Rice	0.85	1.75
Chestnut	3.95	5.05	Barley	0.50	1.50

Bituminous—Despite the usual and expected summer dullness there appears to be a slightly improved tone to the market, especially on Tide shipments. One of the very largest operators expressed satisfaction at the increased shipments from their mines, practically the entire production going to Tidewater. While the domestic trade is not near so active, yet improvement is in sight and felt to a slight extent. This should increase, as many of the largest industrial plants in this territory are going to full capacity and many of them are starting the erection of buildings that will double their plants in six months at the latest. Many of these plants have immense contracts for war munitions extending over periods from two to three years.

Prices have not appreciably changed and rule about as follows:

Georges Creek Big Vein..	$1.60@1.75	Fairmont gas, mine-run..	$1.15@1.25
South Fork Miller Vein..	1.50@1.60	Fairmont gas, slack......	0.65@0.75
Clearfield (ordinary).....	1.00@1.20	Fairmont lump, ordinary.	0.85@0.95
Somerset (ordinary).....	1.00@1.15	Fairmont mine-run......	0.75@0.80
West Va. Freeport.......	0.85@0.95	Fairmont slack..........	0.45@0.75

Ocean charters from Philadelphia have been announced as follows:

Vessel	Nationality	Destination	Tons	Rate
Thistleard	British	Spain	2533	
Oreland	British	Rio de Janeiro		
Millie R Bohannon		Charleston, S. C.	900	$1.10
Herbert May		Savannah	600	
Eva B. Douglas		Wilmington, N. C.		1.00
Charles N. Simmons		Porto Cabello		4.00

Note—Steamers are indicated by **bold face** type.

HAMPTON ROADS

Shipments foreign continue heavy, especially to Italian ports. Prices stationary with fair demand from foreign markets. Heavy railroad dumpings.

The dumpings over the various piers at Hampton Roads have shown up heavy, especially as regards cargoes for Italian ports. Coastwise shipments have been fair and the U. S. Government has also taken some coal. In addition to the New River and Pocahontas coal exported there has been some little high volatile and anthracite shipped. The anthracite, however, only amounted to 85 tons. Coastwise shipments have consisted of New River and Pocahontas mine-run, nut and slack and high volatile coals. Shipments foreign continue to move by sail as well as steam tonnage. The cargoes shipped in sailing vessels during the past week have all been for South American ports with one exception.

Prices at Hampton Roads remain practically the same as for some weeks but with the accumulation somewhat nearer normal. There is a fair amount of vessel tonnage in port with ample coal on hand to take care of same. The dumpings for the Norfolk & Western Ry. for June will be considerably in excess of their May shipments while those of the other two roads will be near their May figures.

The following vessels have cleared from Hampton Roads during the week June 18 to 25:

Norfolk

Vessel	Destination	Tons
Berwindvale	Havana	8100
Calabro	Naples	2362
Bellgrano	Peru	550
Dionyssios Stathato	Bilbao	5646
Orla	Rio

Virginian............	61,688	38,372	34,975	51,644	87,840
	291,828	239,085	321,955	330,979	380,989

BALTIMORE

Reports from mining districts indicate an increased production. Prices continue flat. Export trade holds up well.

An increasing demand from the Lake region and the big export movement are apparently having some effect. Several mining properties of the Maryland Coal Co. and the Davis Coal & Coke Co., for instance, are reported as now doing full time, or reopened for business, during the past ten days. Some companies in West Virginia are seeking men.

While this evidence of better business brings a feeling of encouragement, the coal trade realizes now that a general revival will be slow. Coal is still offered very cheaply at the mines. Demand on contract is slow, and those mining properties showing the present increase are for the most part working on some special orders.

Export business is holding up strong. During the week ending June 26 a total of 77,912 tons was sent out on export cargo account, while 13,248 tons was taken for bunkering. Chartering continues heavy, and there is every prospect for strong trade for weeks to come, at least.

The following steamers were chartered the past week, the Atlantic range quotations being noted, as several will load here:

Vessel	Nationality	Destination	Rate
Apolo	Spanish	River Plate	
Sowell	British	West Coast Italy	$10.56
Tsirapuria	Greek	West Coast Italy	
Mongibello	Italian	West Coast Italy	10.08
Sicania	Italian	West Coast Italy	10.08
Westgate	British	Campana	8.52
Francisco Ciampa	Italian	West Coast Italy	10.08
Allanton	British	Maddalena, Sicily	
Prosper III	Norwegian	River Plate	7.68
Chorley	British	Bahia Blanca	8.88
North Britain	British	River Plate	9.60
Two Ropner Steamers		West Coast Italy	9.60

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Herbert May		Philadelphia	Savannah	318	
Eva B. Douglas		Philadelphia	Wilmington, N. C.	910	$1.00
Millie R. Bohannan		Philadelphia	Charleston	579	1.10
Henry S. Little		Philadelphia	Summerside, P.E.I.	984	2.25
Balgray	British	Baltimore[1]	Piraeus	2318	10.56

Note—Steamers are indicated by **bold face type**, all others being schooners.

[1] Or Virginia. [2] West Coast. [3] Or Gothenburg. [4] Valencia or Tarrangona.

OCEAN FREIGHTS

Charters to Europe somewhat easier. Steamers to South America less plentiful.

A number of steamers were chartered last week for coal to Spanish and Italian ports, and numerous other boats offered for this business, at lower rates than those recently quoted. To the Plate steamers offer sparingly, and a steamer of about 7000 tons coal capacity was chartered, Virginia to Buenos Aires, at $8.64, option Port Militar at $9, but we consider these rates a little above the market, as we chartered steamers for similar business at lower rates.

Freight rates to other destinations are unchanged.

To	Rate	To	Rate
Havana................	$2.00@2.25	Bermuda...............	**$3.00**

W. W. Battie & Co.'s Coal Trade Freight Report.

COKE

CONNELLSVILLE

Sentiment less favorable, market failing to respond to what was considered good news. Prices no higher than in January. Shipments constantly increasing.

In some coke circles the feeling is distinctly less hopeful than a fortnight ago. It is reflected that if general indications really count for anything coke prices should have improved long ere this. While Connellsville coke production and shipments have increased by two-thirds since last December, the increase has been chiefly in the coke of the producer-consumer class. The demand for merchant coke, which comes chiefly from the merchant blast furnaces, has increased but little, and a canvass of the merchant pig-iron trade suggests that perhaps the demand upon the merchant furnaces is not going to increase much after all, and if so there will not be much additional market for merchant coke. One merchant furnace, which has a coke contract at one price to July 1 and at 20c. more for the second-half, is considering blowing out July 1, finding it difficult to sell iron at any price. The coke market on the whole is no higher than it was in December or January and close analysis might show it actually a shade lower. We quote: Prompt furnace, $1.50; second half furnace, $1.75; prompt foundry, $2@2.50; contract foundry, $2.20@2.50, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended June 19 at 348,510 tons, an increase of 13,996 tons, and shipments at 351,774 tons, an increase of 19,181 tons. The increased production was due entirely to the furnace ovens, the merchant ovens losing a trifle. For five consecutive weeks shipments have increased. The low point in production and shipments fell last December, with about 200,000 tons a week.

Buffalo—The reported better feeling in iron continues and it affects the coke trade favorably in a way that it does not affect coal. Coke dealers are much encouraged, for they think it means better business in coal before long. There appears to be a larger supply of foundry than of furnace coke, with the price of the latter consequently stronger. Quotations are firmer on the basis of $4.25 for 72-hr. foundry, $3.80 for 48-hr. furnace and $3.30 for stock coke.

Chicago—Little change is to be reported in the price of coke. The demand for domestic coke is improving slowly, and prices are being well held. Furnace and foundry sizes are easy, and quotations somewhat variable. Prices are as follows: Byproduct, $4.65@4.85; Connellsville, $4.75@5; Wise County, $4.75; gas coke, $3.75@5, furnace, $4.65@4.75.

LAKE MARKETS

PITTSBURGH

Sentiment continues somewhat better but actual trade scarcely improved. Operations 55 to 60%. Slack a shade easier in price.

There is a continuance of the better sentiment in coal trade circles reported a week ago, but the market itself does not reflect any material improvement. The coal industry has perhaps expected too much from the observed improvement in the steel industry; the improvement, while very marked, is apparently due largely to the increased demand for steel for export, both direct export and the manufacture of war munitions for export, and that part of the steel demand does not of course involve any increased coal consumption. If the present demand for steel were all domestic it could not have occurred without a corresponding improvement in industrial conditions generally, requiring the consumption of more coal. The steel industry itself is now a good consumer of coal, but its customers are not correspondingly good consumers.

The Lake trade continues disappointing. The stocks at upper Lake docks are not worked off and shipments are kept at a low rate until the docks can be cleared. With such very good crop prospects, the coal movement later in the season should be much better, but for the first half to be bad and the second half moderately good seems to be about all that can be expected from the present Lake coal season.

Demand for export coal only occasionally reaches the Pittsburgh district, but the shipments of export coal from the Connellsville region are fair, and promise to increase. The Pittsburgh coal district is operating at 55 to 60% of capacity. Slack is a trifle easier, otherwise prices for free coal are unchanged, as follows: Slack, 50@55c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. The contract market for mine-run, to Apr. 1, remains nominally $1.15.

BUFFALO

Some bituminous shippers are finding the demand slightly better. There is less coal waiting to be sold, but the same anxiety to sell. Anthracite not moving any faster.

Bituminous—The feeling is a little better each week. There is no doubt of a stir of some size in iron, but it is too small and recent yet to mean much to the coal trade. Some shippers will not admit that there is any improvement and are sure that there is not going to be any till after the warm weather is over. The amount of Youghiogheny coal on track is less which is a good sign; one shipper reports that he was lately unable to find any in the spot market and had to wait for it. This gives a better market to the cheaper coal produced nearer here and indicates that the other is going to another market. The lake trade is taking more bituminous coal than it was. The export demand is also better by ocean routes, though it does not appear that Canada is taking more.

Slack is selling at low figures but this also means a better Lake trade, as that turns out a large amount of slack. The lake cities prefer a larger proportion of sizes than is produced, so that the home market has to absorb some surplus slack, which often makes it dull through the Lake season. The bituminous prices are quoted as formerly for base, with perhaps a little less cutting than the average, best Pittsburgh lump selling at $2.70, three-quarter at $2.55, mine-run at $2.45, and slack at $2.25. About all the other coal coming here is Allegheny Valley, which takes a price of 25c. less.

Anthracite—The demand is still very light. A few independent shippers report a fair trade, but this is probably due to their not having a great amount to sell. This trade is larger than it used to be and it no doubt cuts into the old line companies somewhat. Local retailers are only doing a small business and will have to fall back on the city work or something of the sort to keep busy. It has been some time since the anthracite mines in general were running on such short time. But for the Lake trade, which is as large as it often becomes at this time of the year, the mines would be very inactive. Shipping agents in the Lake trade say that they have plenty of room on the Upper-Lake docks in spite of reports that sales there are not any more liberal than they are here.

The movement by lake for the week was 170,000 tons, nearly all going to Chicago, Milwaukee and the head of Lake Superior. The small ports appear to be well supplied and the shipments to leading ports are not generally represented by sales.

TOLEDO

Lake movement better. West Virginia coals particularly strong here.

Business generally is better especially in the Lake trade which has picked up wonderfully. The C. & O., docks have recently been doing a record business and the Hocking docks are also unloading quite a lot of coal. The big machines are working a good share of the time now and a boat can be loaded in a comparatively short time, 10,000-ton cargoes being loaded in about four hours. A great deal of West Virginia coal is moving.

Smokeless coal is not in very good demand but there is not very much on the market except mine-run which is extremely plentiful and cannot be moved at any price. Pittsburgh No. 8 is not moving freely. It is still early for threshing coal.

COLUMBUS

A slight improvement is noted in domestic trade. The stocking season is now at hand and there is a slightly better tone. Steam business continues quiet.

The attention of coal men is centered on the stocking season which is now at hand. It is believed that the demand for stocking purposes will be as large as ever, although deliveries are likely to be delayed. There is an improved tone and future prospects are brighter.

Dealers' stocks are the subject of considerable discussion; reports show that some are larger than usual while others are very low. This spotty condition extends throughout Ohio, Indiana and Michigan. Collections are poor which has a bad effect on stocking. Retail trade is quiet although some demand is reported for threshing purposes. Threshing coal is always quite a factor in the rural sections of Ohio. School coal is also attracting considerable attention and many contracts of that nature are being looked after.

Lake trade continues quiet because of the congestion at the Upper Lake ports. It is doubtful if there will be any marked increase immediately after July 1. The movement from the dock is still slow. Considerable West Virginia coal is being shipped to the Northwest but Ohio fuel is not moving as in former years. Eastern Ohio field is gradually increasing its Lake shipments. In the meantime the Hocking Valley docks at Toledo are fairly busy. The tonnage handled for the week ending June 25 was 98,000 as compared with 82,000 tons the previous week. The total tonnage handled over the docks since the opening of navigation is 741,000.

The only strong point in the steam department is the demand for nut, pea and slack, and that is because of limited production. There is much talk of export coal which will undoubtedly strengthen the Columbus trade, although no coal will be exported from Ohio.

Mines have been working at about the following percentage of full capacity:

District	Week Ended June 5	June 12	June 19	June 26	District	Week Ended June 5	June 12	June 19	June 26
Hocking....	30	25	25	25	Cambridge.	35	35	30	30

CLEVELAND

Spot prices from 5 to 15c. under shipment quotations. Lake shippers moved all the coal they could get to the Lakes prior to the end of the month.

All kinds of coals were sold at extremely low prices Monday. No. 8 mine-run sold as low as $1.60, while three-quarter was only 5c. higher. Bergholz, Fairmount, and all Ohio coals went at proportionately low prices. Coal consumption is very much larger than two months ago, but the Lake business leaves too large a surplus for the local market to consume.

Lake shipments the first three days of the week were comparatively heavy. All shippers were working to gain credits on demurrage and cleaned up everything they could find tonnage to hold. The supply of ships was rather light the first half of the week, but the last half there was more capacity than could possibly be used.

Following July 4 the Lake shipments are expected to be much lighter than they have been. The local market is also expected to be rather depleted the first few days, but it will soon have more than enough. The Lake trade will be smaller all through July and part of August. New grain will begin to move the middle of August, and the coal shipments from Upper Lake docks will increase proportionately.

Shipment quotations are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	Ohio No. 8

Slack..........	......	1.45	1.45	1.45	1.45

CINCINNATI

The market is very quiet with buying at a minimum. Steam consumption extremely slow.

As yet there is practically no stocking. The trade is being heavily over-solicited, and dealers feel that they can get coal at any time, in any quantities and at almost any price. The Lake movement is very small and unsatisfactory as compared with normal years, or even with last year. It is evident that Canadian consumption, which takes considerable coal through the lakes, will be very small. Industrial conditions remain bad save in a very few lines, and such contracts as have been closed are at substantial concessions, amounting to 10c. or more.

LOUISVILLE

Stocking movement to begin soon. Possibility of a readjustment in freight rates that will extend certain markets.

The Kentucky market shows virtually no improvement, except perhaps a disposition among the retailers to prepare for the consumers' stocking which will begin soon. The operators are watching with much interest the proceedings in the matter of the complaint to the Interstate Commerce Commission over division of rates on coal. The alleged unfair methods of certain railroads in division of their joint rates shut the Kentucky operators out of the contracts let by the Seaboard Air Line and the Atlantic Coast Line.

Prices are quoted on the May and June basis, as follows: Block, $1.30 to $1.40; round, $1.20 to $1.25. Nut and slack unchanged.

MIDDLE WESTERN

GENERAL REVIEW

Good future demand prompt shippers to uphold prices. Domestic sizes still slow. Screenings softer. No stir in anthracite.

Demand for coal grows slowly, but the general situation is improving. The steam trade shows a slight tendency toward lower prices, and screenings have softened 5c. to 10c. per ton but they are expected to improve again soon. The steam coal prices fluctuate with the increase or decrease in production of domestic sizes, and as the latter advance prices become easier on steam sizes.

Operators apparently have the price situation well in hand and there is very little cutting. The low stocks in the retail yards must necessarily cause increased orders shortly. More activity is being shown in industrial circles, and the railroads are reporting increased traffic, all of which will doubtless stimulate the demand for coal. The approach of the harvesting season has also caused increased orders for threshing trade.

It is said that several railroad contracts embracing considerable tonnage will be executed within the next ten days. An increasing number of inquiries covering future deliveries are coming in and if these materialize into orders production will have to be increased. Country dealers still complain of slow collections, and a great many of them are not stocking up for this reason. Lake shipments are still at a low ebb, and conditions confirm the previous prediction that no Lake movement of any consequence may be expected until toward the latter part of July.

CHICAGO

Price advances cause some increased buying at the month end. Screenings continue high.. Indiana market less favorable. Anthracite under pressure.

The Franklin County field has definitely announced advanced prices to take effect July 1, with resultant stimulation of orders for immediate shipment. The increase at the Illinois mines seems to be more particularly in the Southern group. The price situation in the Franklin and Williamson County fields is in a satisfactory state. Steam lump is somewhat draggy, with prices weak. Screenings have lost an average of 10c. per ton.

A fair volume of steam coal business has been done by Saline and Harrisburg operators and there has been good shipments of domestic sizes for harvesting purposes. There are no surplus screenings and operators are receiving top-notch prices for spot shipments.

The demand for steam sizes from the Indiana mines continues at a low point. No change in current prices for either steam or domestic coals has occurred. Orders for the threshing trade have not been as heavy as expected.

More harvesting coal is moving from the Clinton field than elsewhere, but the steam trade is soft. There is some Knox County coal moving to Chicago schools, but otherwise the mines are averaging about 2½ to 3 days per week running time.

Smokeless coals are firm at circular prices, and increased orders are being booked for the prepared sizes for July shipment. Mine-run has bettered, and a fair number of shipments are going forward at $1.25.

An increased number of orders have been placed for Hocking lump for July delivery. Some tonnage is moving for the harvest trade, and there is no free coal on the market.

Both Kentucky and West Virginia splints have been subject to price cutting. Block coal has been offered at as low as $1.15 and other sizes in proportion. A recent contract for splint is reported to have been made at a price considerably below that of last year for mine-run. Eastern Kentucky prices are most variable, and the market is not in good shape.

A slight increase was noted in anthracite buying toward the end of the month. The price disturbance in the East is evidently reaching Westward, and some concessions have been made by the independents to secure orders.

Quotations in the Chicago market are on about the following basis:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

INDIANAPOLIS

Trade on the full summer basis with prices and production at the minimum. Improved outlook in industrial circles.

Production is down to a minimum and prices at the summer level with the exception of screenings, which hold up to 80 to 90c., most buyers holding off, to see if they will not sag to last year's level. There is moderate buying of Eastern coals by the yards of this city, but not as much as usual is going into storage.

The industrial demand is slow, outside of those factories working on war orders. The steel business is improving, however, the Illinois Steel Co., at Gary, Ind., having this week put its last furnace in blast and the output being up to full capacity, for the first time since 1912. Wheat cutting is in progress and the thresher demand for lump coal will open next week. The usual channels for Indiana domestic lump are almost closed, with the appearance again of summer weather.

ST. LOUIS

Country trade expanding and market is taking on a slightly improved tone.

The market has taken on a slightly stiffer tone, but the improvement has not been sufficient to favorably affect prices. The country trade is reported better than the city, partly due to the threshing demand and partly to improved crop conditions. The country orders are for lump, egg and nut. Country mills are starting up or getting ready to start and that is helping a little also. The Big Muddy Co. announces that the Southern demand is picking up, due to dealers in that section taking advantage of the plentiful supply of cars at this season.

Dealers in this part of the country, where car scarcity is not so troublesome, do not begin laying in a supply until August. The demand for Standard screenings is a little better. Williamson and Franklin County No. 1 nut has gone up a little.

The market is now quotable on about the following basis:

	Wilm. & Frnk. Co.	Sparta	Mt. Olive	Standard
6-in. lump	$1.25@1.35	$1.25	$1.25	$0.90
2-in. lump	....	0.90	1.25	0.77½

FREIGHT RATES

I. C. C. No. 7036—Durham Coal & Iron Co. vs. Central of Georgia Ry. Co.

1. Rate on coke in carloads from Durham and Chickamauga, Ga., to Pacific coast terminals found unjustly discriminatory and unduly prejudicial to the extent that it exceeds the rate contemporaneously in effect to the same points from the Birmingham, Ala., district.

2. Minimum carload weight unreasonable when the cars in which the shipments are made are incapable of being loaded to that weight. Tariffs should provide that in such cases the marked capacity of the car used will govern.

I. C. C. Nos. 6618, 6666—Application of the Pennsylvania Co. under the Provisions of Section 5 of the Act to Regulate Commerce, as amended by the Panama Canal Act, concerning its interest in and operation of the Pennsylvania-Ontario Transportation Company.

Upon application of the Pennsylvania Co. and the Canadian Pacific Ry. Co. under the provisions of section 5 of the act to regulate commerce, as amended by the Panama Canal act, to continue their interest in and joint operation of the Pennsylvania-Ontario Transportation Co.; **Held:**

1. That the existence of through all-rail routes with joint rates applicable thereto in which the petitioners participate renders it possible for petitioners to compete with the boat line in which they are interested, within the meaning of the act.

2. Upon the facts of record the continued joint interest in and operation of the Pennsylvania-Ontario Transportation Co. by the petitioners herein is in the public interest and will neither exclude, prevent, nor reduce competition on the route by water under consideration.

FOREIGN MARKETS

GREAT BRITAIN

Export trade demoralized by the restrictions. Fears expressed of losing trade to South America.

June 18—The coal industry continues to be very seriously disturbed by the newer of the various abnormal factors which are now affecting it. The export regulations are making business very difficult in the shipping centers because of the refusal of so many licenses for exports to neutral countries. Exporters state that it is quite useless to attempt to obtain licenses for South America in particular, while it is growing harder to secure the sanction of the export committee for shipments to coaling stations and elsewhere, licenses being only given in special circumstances. Efforts on the part of the chambers of commerce and influential exporters to secure a modification of the restrictions have had no result. Many colliery owners in South Wales and elsewhere find themselves faced with growing stocks, and it is feared that instead of decreasing home prices, the only effect of the severity of the regulations will be to close down collieries. It is also pointed out that American coals are pouring into Brazil, the Plate, Argentine and Uruguay, and that it will not be easy to get the business back again. The possibility that the Board of Trade may fix a maximum price is also retarding inland business.—"The Iron and Coal Trade Review."

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principals in the coal trade.

✚Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page, all in Vol. 7, on which the detail notice appeared.

No.	Purchaser	City	State	Tonnage	Page
869	Board of Education	Washington	Penn.	25,000[1]	1086
895	County Commissioners	Monticello	Ind.		1086
914	Board of Education	Fort Dodge	Iowa		1126
921	County Commissioners	Rensselaer	Ind.	400	1127
927	County Commissioners	Shelbyville	Ind.		1127
931	Board of Education	Sharon	Penn.		1127

[1] Bushels.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

No. 598—New Orleans, La.—It is said that the United Fruit Co. is in the market for approximately 100,000 tons of coal for use on steamers operating out of Mobile and New Orleans to Central and South American points. Previous contract of this company was run in Vol. 7, p. 794. Address Purchasing Agent, United Fruit Co., New Orleans, La.

✚No. 843—Columbus, Ohio—Bids have been received on this contract (Vol. 7, p. 1049), which provides for furnishing the local county buildings with coal as follows: Fletcher-Williams Coal Co., Hocking mine-run, $1.59 at infirmary switch and $1.89 to the court house, morgue and Memorial building; M. A. Suydam & Co., Pomeroy, W. Va., mine-run, $1.95; Peacock Coal Co., same, $1.60 a ton at infirmary switch; J. Rapp & Co., court house, morgue and Memorial building, $1.90 and at infirmary switch, $1.65; Taylor-Williams Coal Co., West Virginia, Island Creek mine-run at court house and memorial hall, $2.11, at county morgue, $2.21 and at county infirmary switch, $1.74; Homer Gill, Hocking mine-run $1.70 at infirmary switch and at court house, memorial hall and morgue, $2.15; Elk Coal Co., Cedar Point mine-run at infirmary switch $1.70 and Hocking mine-run at infirmary switch $1.55; Lorain Coal & Dock Co., Island Creek, W. Va., mine-run $1.70 at infirmary switch; Victoria Coal Co., Hocking mine-run at infirmary switch $1.57½, West Virginia mine-run at infirmary switch $1.65; New York Coal Co., Hocking mine-run at infirmary switch $1.70; Maynard Coal Co., Pomeroy mine-run at infirmary switch $1.70; Maple Hill Coal Co., West Virginia mine-run at infirmary switch $1.85; Hocking Valley Products Co., Hocking mine-run at court house, Memorial building and morgue $2.03 and at infirmary switch $1.69; Franklin Builders Supply & Coal Co., West Virginia mine-run $2.17 delivered and Ohio mine-run $2.04 delivered. Address Clk. John Scott, Bd. of County Comrs., Columbus, Ohio.

✚No. 856—Kansas City, Mo.—This contract (Vol. 7, p. 1085), which provides for furnishing the local Board of Education with approximately 7000 tons of semianthracite and bituminous coal, will be awarded about July 15. Address Pur. Agt. F. S. Casey, Bd. of Edu., Kansas City, Mo.

No. 934—Worcester, Mass.—This contract (Vol. 7, p. 1127), which provides for furnishing the various public buildings at this place with coal during the ensuing year was bid on as follows: Anthracite, F. E. Powers Co., $6.79; Peoples Coal Co., $6.75; C. K. Smith Co., $6.94; O. G. Hedlund Co., $7.02. Bituminous (with a B.t.u. value ranging from 14,000 to 14,300), F. E. Powers Co., $4.70; Claflin-Summer Co., $4.79 or more; Peoples Coal Co., $4.57 or more; O. G. Hedlund Co., $4.84 or more. Address Supt. of Public Buildings George C. Halcott, Room 35, City Hall, Worcester, Mass.

New Business

✚No. 943—Wescoesville, Penn.—The Directors of the Poor of Lehigh County will receive bids until 2 p.m., on July 5, for furnishing the County Home with 1200 tons of bituminous and 200 tons of anthracite chestnut coal during the ensuing year. Bids should specify clearly what kind of coal it is proposed to furnish, and prices quoted should be f.o.b. cars at 17th and Gordon St. siding, Allentown, Penn. Address County Controller Cyrus J. Dilcher, Allentown, Penn.

No. 944—Chicago, Ill.—The Brighton Foundry Co. purchases a few cars of Illinois or Indiana mine-run from time to time. It will be in the market for one or two cars about Aug. 1. Address Purchasing Agent, Brighton Foundry Co., Chicago, Ill.

No. 945—Chicago, Ill.—Butler Bros. will be in the market about Aug. 1 for 2500 tons Illinois or Indiana screenings; also 2500 tons Illinois or Indiana egg or nut. The contract is let to May 1, 1916. Address Purchasing Agent, Butler Bros., Chicago, Ill.

No. 946—Chicago, Ill.—The Artesian Stone & Lime Works will purchase three cars of Pocahontas mine-run about Aug. 1. Address Purchasing Agent, Artesian Stone & Lime Works, Chicago, Ill.

✚No. 947—Towson, Md.—The Maryland State Normal School received sealed bids until 11 a.m., June 26, for furnishing 800 gross tons of Georges Creek Big Vein coal. Bids were to include cost of delivery in the bins of the power house. Address Secy. M. Bates Stephens, State Bd. of Edu., Annapolis, Md.

No. 948—North Vernon, Ind.—The Coöperative Enterprise Glass Co., at this place, purchases about 500 tons of good steam coal per annum. The present contract expires Aug. 1 and deliveries are at the rate of one car per month. Mine-run coal is required. Address Pres. Thomas P. Finnerty, Coöperative Enterprise Glass Co., North Vernon, Ind.

No. 949—Chicago, Ill.—The Acme Malting Co., of this place, will be in the market about Aug. 1 for two cars per week of Indiana mine-run coal. Address Pur. Agt. W. P. Rice, 4501 Cortland St., Chicago, Ill.

✚No. 950—Linden, N. J.—The Board of Education in this district will receive bids until 8 p.m., July 14, for furnishing about 200 tons of anthracite, pea, and nut coal. All bidders are required to furnish a certified check for one-quarter of the amount of the bid. Deliveries are to be made as required. Address District Clk. Thomas H. Keys, Bd. of Edu. School No. 1, Wood Ave., Linden, N. J.

✚No. 951—Knoxville, Tenn. — A committee has been appointed by the Board of Education to receive bids for the coal supply during the season of 1915 and 1916. The contract last year amounted to about $3000, and it is estimated that it will be even more this year. Address Fred W. Keith, Knoxville, Tenn.

✚No. 952—Fairport, N. Y.—The Fairport Municipal Commission will be in the market about Aug. 1 for approximately 2000 tons of bituminous mine-run coal. It is understood that the business is not let on competitive bids. The customary price is $2.75 per ton. Address Supt., C. J. Sullivan, Fairport Municipal Commission, Fairport, N. Y.

No. 953—Lynn, Mass.—The Board of Education at this place usually contracts for its annual fuel requirements about Aug. 1. The business last year was done on the following basis: 2057 tons New River coal at $4.20; 833 tons egg coal and 57 tons of stove at $6.75; 292 tons broken, $6. The call for bids is advertised. Address City Purchasing Agent, City Hall, Lynn, Mass.

✚No. 954—Port Gibson, Miss.—The Light & Water Department at this place usually contracts about Aug. 1 for approximately 1600 tons of Kentucky lump coal, which usually costs $3 per ton delivered. Business is let on competive bids. Address H. D. Brownlee Light & Water Department, Port Gibson, Miss.

No. 955—Manistee, Mich.—The Manistee Flouring Mill Co. at this place, usually contracts for their coal supply about Aug. 1. The company has lately been equipping its mill with electricity, so that their coal requirements will be materially reduced. Address Pres. G. A. Hart, Manistee Flouring Mill Co., Manistee, Mich.

No. 956—Petersburg, Ill.—The Abbott Light & Power Co., at this place consumes approximately 3200 tons of screenings per annum. Their contract expires about Aug. 1, and the business is let on competitive bids. The contract for the past year was at about $1.25 per ton. Address B. Hubbard, The Abbott Light & Power Co., Petersburg, Ill.

+No. 957—Xenia, Ohio—The County Commissioners at this place will receive bids until 10:30 a.m., July 3, for furnishing coal as follows: Court House 200 tons; Greene County Library 50 tons; Infirmary Home 300 tons; County Jail, Pocahontas mine-run 35 tons. The supplies for the Heating Plant, Library and Jail are to be delivered in the bins and that for the Infirmary Home on side track convenient of access. One half the deliveries are to be completed before Sept. 1, and the balance before Feb. 1, 1916. Address County Commissioners, Court House, Xenia, Ohio.

+No. 958—Washington, Ind.—The Electric Works at this place usually contracts about Aug. 1 for their annual requirement of coal involving about 5000 tons. Mine-run coal is required and the usual price is about $1.37 per ton delivered in the bins. The business is done on a competitive basis. Address The Electric Works, Washington, Ind.

+No. 959—Wenatchee, Wash.—The Local School Board received bids until noon, July 2 for furnishing 140 tons of coal. Bids are requested both f.o.b. cars at Wenatchee, and delivered in bin. Specifications may be obtained on application. Address Clk. Theresa Unger, Bd. of Edu., Wenatchee, Wash.

+No. 960—Harriman, Tenn.—The Harriman Water & Light Department usually contracts about Aug. 1 for their annual requirements of coal involving approximately 2160 tons. Middle Creek, Tenn., coal is ordinarily used, and the price is about $1.35. It is understood the business is not let on competitive bids. Address R. Walzl, Harriman Water & Light Dept., Harriman, Tenn.

No. 961—New York, N. Y.—Bids will be opened at 2 p.m., July 6, by the College of the City of New York, for furnishing and delivering 4800 gross tons of No. 3 buckwheat and 1600 tons, of semibituminous mine-run at Amsterdam Ave. and 139th St. Particulars may be obtained on application. Address the Curator of the College, Room 114, Main Building, 139th St. and Convent Ave., New York City.

+No. 962—New Orleans, La.—The New Orleans Butchers' Abbattoir, at this place, are testing samples of steam coal and will contract for their annual supply some time during the current month. Address New Orleans Butchers' Abbattoir, North Peters and Alabo St., New Orleans, La.

+No. 963—Aberdeen, S. D.—The Board of County Commissioners at this place will receive bids until 2 p.m., July 6 for furnishing the coal requirements for the Brown County House, Poor Farm, and County Poor during the ensuing year. Bids are requested on Kentucky block, Pocahontas and lignite coal. Address County Audr. J. C. Daly, Bd. of County Comrs., Aberdeen, S. D.

+No. 964—Breckenridge, Penn.—Sealed proposals will be received until July 6 for furnishing the local public schools with screened and mine-run Bull Creek coal. Address Secy. John W. Girt, Breckenridge Borough Public Schools, Breckenridge, Penn.

+No. 965—Kent, Ohio—Sealed bids will be received by the local Board of Education until 8 p.m., July 6, for the delivery of approximately 220 tons of three-quarter screened bituminous coal to the various school buildings. Address Clk. W. B. Andrews, Bd. of Edu. Kent, Ohio.

+No. 966—Pineville, La.—It is understood that the State Hospital for the Insane at this place will contract in the near future for their fuel requirements during the ensuing year. About 12,000 tons will be required. Address Supt., State Hospital for the Insane, Pineville, La.

No. 967—Aspinwall, Penn.—Sealed bids were received by the local City Government until 7:30 p.m., July 3, for furnishing the pumping station with coal as required during the ensuing year. Quotations are made f.o.b. Aspinwall Pumping Station, and bidders were required to give the name of the mine from which the coal used is to be shipped. About 100 tons a month of nut, nut and slack, and slack coal will be required. Address Borough Clk., S. R. Chase, 230 First St., Aspinwall, Penn.

+No. 968—Van Wert, Ohio—Sealed bids will be received by the local Board of Education until noon, July 6, for furnishing the various school buildings with approximately 400 tons of coal. Quotations are to include cost of delivery into the buildings as required. Bids are requested on Hocking ¾-in. screened, West Virginia mine-run, three-quarter and 5 in. screened. Address Clk. J. M. Showalter, Bd. of Edu. Van Wert, Ohio.

+No. 969—Hillboro, N. D.—The County Commissioners at this place will receive bids until 10 a.m., July 15, for furnishing approximately 200 tons of Georges Creek smokeless or lignite coal, deliveries to be made in carload lots at the Court House, during the period Oct. 1 of the current year to May 1, 1916. Address County Audr. Nels O. Lindaas, Bd. of County Comrs., Hillsboro, N. D.

No. 970—Gretna, La.—The American Cotton Oil Co. at this place are said to be in the market for their supply of steam coal. Address American Cotton Oil Co., Gretna, La.

+No. 971—Liberty, Ind.—The Board of Education at this place will receive bids until July 9 for 150 tons of Winifrede coal. Address Secy. F. T. Dubois, School Trustees, Liberty, Ind.

+No. 972—Chicago, Ill.—The United States Gypsum Co., is reported to be in the market for 300 tons of fuel coke per month during the ensuing year. Address Purchasing Agent, United States Gypsum Co. 205 W. Monroe St., Chicago, Ill.

+No. 973—St. Cloud, Minn.—Sealed bids will be received by the Board of Education at this place for furnishing approximately 300 tons of bituminous coal deliveries to be made on or before Aug. 3, at different buildings. Deliveries are requested on Fairmont nut, Youghiogheny screened lump, run apile, Hocking screened lump, run apile and nut. Address Secy. Julius Adams, Bd. of Edu. St. Cloud, Minn.

+No. 974—Muscatine, Iowa—The Board of Education at this place will receive bids until noon July 6, for furnishing and delivering approximately 800 tons of coal to the various school buildings during the ensuing year. All the coal is to be four- to six-in. lump which is to be unloaded with forks and the residue delivered to buildings heated with boilers. Address Chn. Charles Ruthenberg, Fuel & Light Com., Bd. of Edu., Muscatine, Ia.

+No. 975—Lake Benton, Minn.—The City Government here will receive bids until 7 p.m., July 6, for furnishing a car of Youghiogheny coal to be delivered at the pump house. Address Village Recorder E. M. Kimball, Lake Benton, Minn.

No. 976—Salem, S. D.—Sealed bids will be received by McCook County until 2 p.m., July 6, for furnishing various kinds of bituminous coal. Quotations should be made f.o.b. Salem. Address County Audr. C. F. Erickson, Salem, S. D.

+No. 977—Brazil, Ind.—The Board of Education at this place received bids until July 2 for furnishing approximately 1000 tons of screened coal for the local school buildings. Address Secy. H. D. Falls, Bd. of Edu. Brazil, Ind.

No. 978—Kansas City, Mo.—The American Sash & Door Co., at this place, which is now buying its coal in the open market, is reported to be considering a proposition to contract for its requirements. They consume about 80 tons of bituminous coal per week. Address Purchasing Agent, American Sash & Door Co., Kansas City, Mo.

+No. 979—Mitchell, S. D.—The City Government will receive bids until 8 p.m., July 6, for furnishing about 550 tons during the ensuing year. Deliveries are to be made as required. Bids are requested on Pocahontas mine-run, Youghiogheny, screened lump and Matilda lump and should be made f.o.b. cars, Mitchell. Address City Audr. Thomas Eastcott, Mitchell, S. D.

No. 980—Kansas City, Kan.—The National Zinc Co. expects to be in the market soon for its annual coal requirements for the year beginning Sept. 1. They ordinarily use Cherokee slack and mill coal. The plant is at Argentine, a suburb of Kansas City. Address Purchasing Agent, National Zinc Co., Kansas City, Kan.

+No. 981—Bloomsburg, Penn.—The Board of Education is receiving bids for their annual fuel requirements amounting to 300 tons of No. 6, 50 tons of buckwheat and 25 tons of No. 4. Address Chn. C. L. Pensyl. Supply Com., Bloomsburg, Penn.

No. 982—Sheffield, Mo.—The Kansas City Bolt & Nut Co. is requesting bids to furnish their annual fuel requirements amounting to about 10 cars. Address Treas. H. K. Warren, Kansas City Bolt & Nut Co., Sheffield, Mo.

+No. 983—Washington, Kan.—The County Commissioners will receive bids until noon, July 8, for furnishing 110 tons of screened Cherokee coal to be delivered in bins at the Court House and Jail. Address County Clk. F. C. McKelvy, Washington, Kan.

No. 984—Kansas City, Mo.—The Smith & Sons Mfg. Co., of this place will contract some time during the current month for 12 cars of slack coal to be delivered during the ensuing year. Address S. F. Smith, Lydia & Guinotte Aves., Kansas City, Mo.

+No. 985—Washington, D. C.—It is unofficially understood that the Navy Department is negotiating orders aggregating

45,000 tons of coal to be delivered for bunkering purposes through Philadelphia. Address Paymaster General of the Navy, Samuel McGowan, Washington, D. C.

+No. 986—New Orleans, La.—The Sewerage & Water Board of New Orleans will contract in August or September for their annual supply of steam coal amounting to between 10,000 and 18,000 tons. Address A. V. Wertz, Sewerage & Water Board, New Orleans, La.

No. 987—Kansas City, Mo.—The Witte Iron Works Co. at this place, which uses about 15 cars of Cherokee mill coal per year, are said to be considering a contract instead of buying in the open market as they now do. The plant is at Centropolis, Mo. Address Purchasing Agent, Witte Iron Works Co., Kansas City, Mo.

+No. 988—Atlantic City, N. J.—The Government engineer will receive bids until July 12 for furnishing about 3000 tons of bituminous coal for delivery at this place. Complete information may be had on application. Address U. S. Engineer Office, Wilmington, Del.

+No. 989—Frankfort, Ky.—The State Board of Control for Charitable Institutions will receive bids until noon, July 9, for furnishing coal during the fiscal year beginning July 15. These grades will be required: Eastern State Hospital at Lexington, mine-run; Central State Hospital at Lakeland, nut and slack; Western State Hospital at Hopkinsville, nut and slack and pea and slack; Kentucky Institute for Feeble-Minded Children at Frankfort, nut and slack. The contract will be let on a heat unit basis, and all bids must be submitted on blank forms, which may be obtained on application. Address Kentucky State Board of Control for Charitable Institutions, Capitol, Frankfort, Ky.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

No. 205—Norristown, Penn.—This contract (Vol. 7, pp. 400, 626), which provides for furnishing the local School Board, has been awarded to **Bodey & Solomon** as follows: 150 tons stove, $6.15; 25 tons egg, $5.90. Metzger & Son obtained a contract for 115 tons of pea at $4.35. The award of 200 tons of bituminous coal was not made because it could be bought to a better advantage in the open market. Address Secy. Harry W. Akins, 717 DeKalb St., Norristown, Penn.

+No. 624—Providence, R. I.—This contract (Vol. 7, pp. 795, 1126), which provides for furnishing the Board of Education with about 8500 tons of anthracite coal, has been awarded to the **Robert E. Smith Co.** at $5.98 for Highland egg and $6.23 for chestnut. Address Secy. Henry B. Rose, Public School Dept., 32 Summer St., Providence, R. I.

+No. 735—Davenport, Iowa—This contract (Vol. 7, p. 917), which provides for furnishing the Board of Education with about 2900 tons of coal, has been awarded as follows: **Denger Bros.**, Springfield lump, $2.68; 2-in. Harrisburg screenings, $2.28. **Rock Island Fuel Co.**, 6-in. egg, $2.65. Address Secy. J. D. McCollister, Bd. of Edu., 1144 Main St., Davenport, Iowa.

No. 760—New Bedford, Mass.—This contract (Vol. 7, p. 955), which provides for furnishing the Board of Education with 2600 tons of egg and stove coal, has been awarded to **F. T. Akin & Co.**, at $6.84 per ton. Other bids on the contract were: Patrick Connor, $7.95; Dennison Bros. Co., $6.98; City Coal Co., $6.90. Address Clerk, Chas. P. Sawyer, Committee on Fuel, City Council, William St., New Bedford, Mass.

+No. 842—Columbus, Ga.—This contract (Vol. 7, p. 1049), which provides for furnishing the local schools with coal during the ensuing year, has been awarded to the **Acton Coal Co.**, on Margaret lump coal at $1.80 per ton f.o.b., Columbus, Ga. Address Supt. R. B. Daniel, Public Schools, Columbus, Ga.

+No. 849—Dorchester Center, Mass.—This contract (Vol. 7, p. 1049), which provides for furnishing the State Hospital with 275 tons of anthracite coal, has been awarded to **D. Doherty Co.**, on assorted sizes at $7.19 per ton. Address Henry Lafavour, Finance Com., Boston State Hospital Commission, Dorchester Center, Mass.

+No. 882—Tracy, Minn.—This contract (Vol. 7, p. 1086), which provides for furnishing the local Board of Education with coal during the year beginning July 1 has been awarded to **Rialson & Son** on Youghiogheny lump at $5.55 per ton delivered at the School Buildings. Address Clk. C. C. Richard, Bd. of Edu. Tracy, Minn.

+No. 897—Lyndhurst, N. J.—This contract (Vol. 7, p. 1087), which provides for furnishing the local Board of Education with about 90 tons of egg and 250 tons of pea coal, has been awarded to **Wm. H. Wurdemann** at $4.49 for pea and $6.25 for egg. O. Kiesewette & Co. bid $4.80 for pea and $6.30 for egg and Jesse P. Joralemon bid the same. Address Wm. J. Liston, Bd. of Edu., Lyndhurst, N. J.

+No. 960—Liberty, Ind.—This contract (Vol. 7, p. 1087), which provides for furnishing the Municipal Government with about three cars of Island Creek mine-run coal, has been awarded to **C. A. Ward** at $2.80, delivered at the Water Works. W. H. H. Clark & Son bid $3.10. Address Town Clk. R. M. Duvall, Liberty, Ind.

No. 926—Detroit, Mich.—This contract (Vol. 7, p. 1127), which provides for furnishing the Police Department with its fuel supply, has been let to the **United Fuel & Supply Co.**, at $6.49 for stove and egg coal, and $6.74 for chestnut. Address Asst. Secy., Howard Whelan, Metropolitan Police Dept., Detroit, Mich.

+No. 929—New Orleans, La.—This contract (Vol. 7 p. 1127), which provides for furnishing the Charity Hospital with about 6000 tons of coal during the ensuing year, has been awarded to **F. S. Walshe,** of the Tennessee Coal & Iron Co. Address Hon. Chas. A. Farwell, Charity Hospital, New Orleans, La.

Contract Notes

Davenport, Ia.—Denger Bros. of Davenport and the **Rock Island Fuel Co.** have been awarded contracts for supplying coal to the Davenport Public Schools.

Chicago, Ill.—Much favorable comment is heard regarding the manner in which the operators' association in Illinois has been maintaining prices in the face of the recent dullness.

Terre Haute, Ind.—The Acme Coal & Lime Co. of this city secured the contract for coal for the schools for next school year, at $1.98 a ton for Greene Valley, No. 4, 1½-in. shaker rescreened coal.

Tappen, N. D.—The Board of Education at this place will receive bids until July 12 for delivery of coal at the coal shed of Tappen School, District 28. Address, Clk. James McKee, Bd. of Edu., Tappen, N. D.

Lowell, Mass.—The mill of Wm. E. Walsh at this place consumes about 300 tons of New River coal per annum, which is delivered by wagons from the railroads. The mill has a storage capacity of 50 tons.

Greenville, Penn.—The School Board at this place will receive bids until July 5 for hauling coal from Canon & Miller and Zuschlag coal banks to the 14 school houses located in the district. Address, Secy. I. C. Brown, School Bd., Greenville, Penn.

Buffalo, N. Y.—The bids for supplying coal to the county institutions were opened by the Board of supervisors on June 25 (p. 957). They are quite complicated and are in several divisions, and it will require sometime to determine the lowest bidder.

Pottstown, Penn.—The contract for supplying the public schools at this place has been awarded as follows: 320 tons of pea at $4.60 and 50 tons of broken $5.75 to **J. H. S. Griess & Co.**; and 150 tons of bituminous coal at $3.25 to Hatfield & Hilles.

Spain—An American consular officer in Spain reports that a business man in his district desires to import coal. Prices and full information should be sent at once. He desires to receive quotations c.i.f. destination, otherwise f.o.b. New York. Correspondence may be in English. References are given.

Chicago—The American Can Co. has placed contract with the **Consolidated Indiana Coal Co.** for fifty per cent. of its requirements of screenings for next year at its four plants, located in Chicago, Maywood and Joliet. It is understood that the contract covers Hymera Fifth Vein screenings at 75c. per ton at the mines.

Milton, Ky.—Local coal yards in this river town are filled to capacity for the first time in months. The dealers, the Trimble Milling Co., and J. P. Strother are all reported to be stocked up with enough coal to last for perhaps a full year. The coal at this point is unloaded from the barges into wagons with a steam shovel and a steam winch is used in assisting the teams up the levee slope.

Knightstown, Ind.—The contract for furnishing the Indiana Soldiers' & Sailors' Orphans' Home at this place, regarding which an item was run on p. 1088 of Vol. 7, has been awarded to **Walter Bledsoe & Co.**, on No. 4 Linton mine-run coal at $1.80 per ton. The coal furnished by the Ohio & Kentucky Coal Co. who had this contract during the past year gave excellent results but it is computed that $900 per annum is saved by using the local product although this latter does make more ash and clinkers and is not so desirable to burn. Address Steward F. F. Boltz, The Indiana Soldiers' and Sailors' Orphans' Home, Knightstown, Ind.

COAL AGE

Vol. 8 NEW YORK, JULY 10, 1915 No. 2

A Personal Inventory

ONCE A YEAR or once in six months we take an inventory. We enter plant, equipment, supplies, etc. We deduct expenses, debts and depreciation. We endeavor to miss no asset or liability.

If our latest balance sheet shows that our credits are not growing, we decide there is something wrong with our methods, and we seek a remedy.

That's all very well and just as it should be; but—

How about taking a personal inventory?

How much of good-will have we been able to secure in the last six months? It is a valuable asset.

How much of co-operation? It is a resource.

Have we earned the respect and fidelity of our men? Do they support us?

How much of ill-will have we aroused? It is a liability.

How much of antagonism? It is a definite loss.

If we have earned the contempt and ill-will of our employees, there is something wrong with our methods. If our personal debts are growing faster than our personal credit, we need to adopt another system.

In the routine of business we of course acknowledge such things as checks sent us to pay for cars of coal, but do we acknowledge and show appreciation for the many little expressions of loyalty and faithful service on the part of employees? Without loyalty and efficient service we won't have cars of coal to sell.

We pay good money for advertising to promote confidence and increase trade. Do we deal frankly and openly with our men to secure the confidence which must precede honest, efficient and cheerful service?

We fill all our contracts with dealers to the letter. Has our treatment of the lowly trapper-boy been just as square?

A small item? So is postage, but we can't run our business without postage stamps.

The next time we inspect our plant let us take a look at ourselves. Perhaps we can find a way—quite simple and often overlooked — whereby we can improve the morale of our working organization.

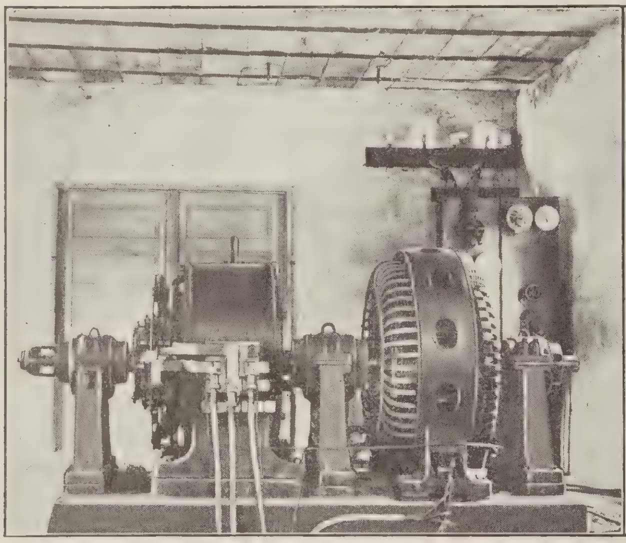
Written by GEO. N. LANTZ, *New Straitsville, Ohio*

Economics of the Central Station in Coal Mining

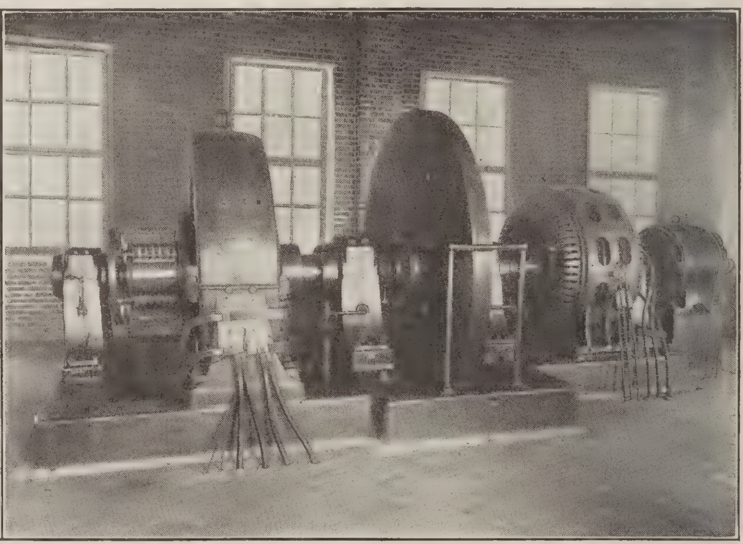
By T. R. Hay*

SYNOPSIS—Coal operators in the majority of cases do not know what their power costs or should cost. Consequently they regard central-station service with an indifference which may be dispelled only by the submission of a proposition for current. The preparation of a power contract usually reveals conditions and practices previously unsuspected.

Coal operators are finding it increasingly imperative to reduce the cost of mining and are consequently seeking ways and means of accomplishing this result. The labor cost of coal production is increasing, and consequently operators are investigating other items entering into the expense of coal production and analyzing them, with the view to discovering possible leakage.



A 150-KW. WESTINGHOUSE THREE-BEARING MOTOR-GENERATOR SET



AN ALLIS-CHALMERS FLYWHEEL MOTOR-GENERATOR SET

The average coal producer believes that he is securing his power at a low cost, since his fuel is cheap, his apparatus simple and his overhead charge for buildings low. Fuel at the mines costs of course whatever it will bring in the market. On the other hand, the question of water supply may be serious, as bad water may necessitate heavy and frequent renewals.

The boilers, engines and generators used at mines are, generally speaking, of the simplest type. Reliability is the primary requisite, and with the unskilled or semiskilled help available, this can be obtained only with simple equipment. It will generally be found that power costs are capable of material reduction by the introduction of scientific and uptodate methods of generation, distribution and application. It is here intended to discuss the general features or elements entering into the cost of power both from the point of view of the central station and of the coal operator.

As a general rule accurate and complete cost records are not available at mines, and until something goes wrong the power plant is usually regarded as the least important part of the operation. When the subject of central-station power is first broached the general attitude of coal operators is one of indifference, and this feeling can be overcome only by the submission of data based on actual operating tests. This if properly arranged will usually act as a challenge to the operator to disprove the conclusion reached.

Unsuspected Conditions Will Probably be Found

The collection of this data will usually reveal conditions before unsuspected and will lead to a study of power-application of great benefit to the coal operator.

If the results of the investigation make consideration of central-station service advisable, a detailed investigation of existing power costs as well as methods of application should be made. Full consideration must be given to the cost of application in central-station service and the specific advantages to be derived therefrom. By the use of recording watt-hour and demand meters, together with a record of the tonnage, the total consumption, maximum demand and power requirements per ton of coal mined may be obtained. This data will afford a means of comparison of central-station service and isolated-plant operation and may be used as a basis of further estimate.

In selecting the equipment necessary in order to enable central-station service to be used most economically, it should be borne in mind that it is desirable to have as little machinery as possible operated by direct current, as such operation increases the losses due to transformation of the central-station supply.

A plant operated partly by steam and partly by central-station power is ordinarily not advisable. Consequently all steam equipment should be changed to electrical. This

---

*4506 Fifth Ave., Pittsburgh, Penn.

condition necessitates that fans, pumps and other steam-driven equipment should be converted into alternating-current motor drive, while rotary converters must be installed for supplying direct current to the machinery inside the mine.

Before committing himself to the adoption of central-station power the operator should convince himself by a thorough investigation that the change will bring about justifiable economy. Consideration should be given to the estimated saving in dollars and cents as well as to the investment required to secure this saving. The life of the mine, the location and competitive features of the available market, the value of the coal, conditions of mining, general reputation of the company furnishing power as to continuity of service, the plans for future development of the existing operations and the possibility of later additions, as well as other related features of the operation, should be given due consideration before any investment or changes are made. Regard should also be had for the general features of attendance, operation and control, also to the flexibility and adaptability of electrical equipment to the severe conditions encountered in coal-mining work.

Replacing Perfectly Good Apparatus with New

The contention is usually made that a change of power supply necessitates disposing of existing equipment and that it does not seem reasonable to replace apparatus in good condition with new. If proper depreciation on the old apparatus has been charged against it, its value as carried on the books should be small, and if the proper method of bookkeeping has been employed and a certain percentage charged against the original purchase price of the equipment for each year of operation, the original cost will have been in large measure liquidated and the interest due to this investment can be charged off as practically zero.

In case the operator is unable to make the financial outlay necessary, but desires to use central-station energy, the power company may purchase and install the necessary equipment, operating it on a rental basis until such time as the original cost, together with accrued interest, shall have been liquidated, after which the apparatus shall become the property of the coal operator. If this method is not followed, the charge to the operator for his power may be of such an amount as to cover the cost of the power and also to liquidate the original cost and accrued interest of the operator's investment within a certain length of time, after which the rate may be reduced to that regularly charged other consumers coming under the same classification as the particular operation under consideration. This rate should be agreed upon when the contract is to be signed.

With many operators the cost of making a change from isolated-plant to central-station power forms a most formidable obstacle. While it is true that the fixed charges as included in the charge made by the central station would be present whether the power was generated locally or purchased, it will nevertheless usually be found that the fixed charge made by the central station is no greater and in many cases is less than when computed on the basis of a local plant.

Assuming that the charge in both cases is equal, it may nevertheless mean much for an operator whether he is obliged to finance an independent power plant or to pay the equivalent fixed charge on an investment made by the power company. The situation is analogous to the purchase or rental of property, and in any enterprise this difference may either greatly facilitate or handicap development. When money is hard to secure and can be obtained only at a high rate of interest, the availability of central-station service may be opportune by making possible developments that might otherwise be compelled to wait. Where the necessary capital is already available or can be readily obtained under favorable conditions, it should be remembered that all capital not needed for plant outlay may be used elsewhere.

The Question To Be Decided

It is immaterial to the consumer what may be the investment or overhead charges of the power company; the one question to be decided is whether or not power may be utilized more economically and satisfactorily when purchased from a central station than when generated locally. Many coal operations, both old and new, are finding it economically advisable to use central-station service.

Not one operator in ten knows what his power is costing him or what it should cost. Many plants erected during, say, the past 10 years were not designed or built with regard to efficiency or economy in operation, but merely to produce power to mine coal. With the advent of the central station in the coal-mining field, the inefficient and uneconomic operating characteristics of these plants were soon discovered, and it has often been found advisable to correct these faults by purchasing power, where the life of the operation would warrant this course.

In most cases the operator has a scant knowledge of what features enter into the sale of electricity as well as just what is contemplated by the contract. This proposition should be gone over in detail and a thorough explanation made of what is contemplated. The general rule followed by most central stations selling power to coal mines is the installation of instruments recording the kilowatt consumption and the demand.

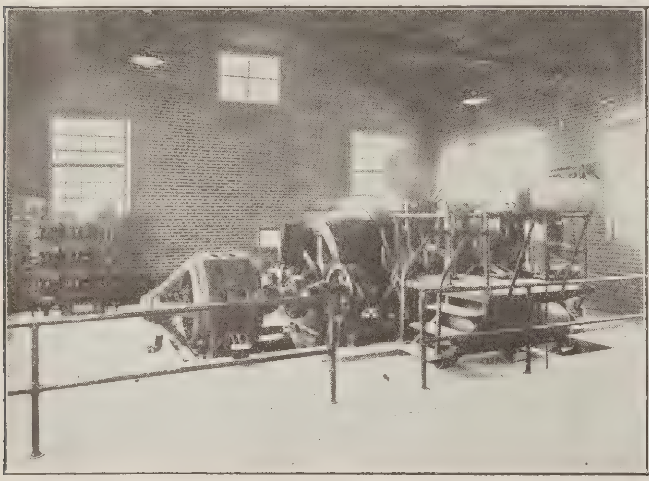
The basis of a power contract will be a minimum or primary charge which is necessary in order to protect the company in case of abnormal conditions, such as a strike or a more or less indefinite shutdown. The power company has a large investment in transmission lines, generating equipment, transformers, etc., and the fixed charge on this investment is continuous, whether or not the equipment is producing and delivering power.

The minimum charge, while perfectly reasonable from the central station's point of view, may not be readily understood by the average coal operator. A little logical reasoning and explanation should, however, readily convince the operator that all customers, in proportion, have to bear their indirect share of the central station's fixed charge. When abnormal conditions arise it is usual in most cases to arbitrarily reduce the minimum or primary charge by from 50 to 75 per cent. or else to provisionally cancel the existing contract, submitting for it a new and temporary contract based on the measured demand plus the usual charge for energy.

Determining the Maximum Demand

The proper method of determining the maximum demand, and consequently the minimum charge, is the subject of a wide diversity of opinion. It is sometimes based on the average of several integrated 5-min. peaks taken throughout a normal working day. Other companies prefer to figure this maximum demand from the result of the average integrated peaks of longer duration, say 10 to 15 min. The principal objection to this method of calculating the maximum demand is that the peaks may happen to be taken when conditions are not normal and hence may give erroneous results.

This method, however, of taking the 5-min. integrated peaks seem to be the best and most satisfactory one available. Its coefficient of error is not so large as to make any appreciable difference in the results. In some cases the primary, or minimum, charge may be based on the load factor, which is generally understood to be the ratio of the average load in kilowatts extending over an appreciable length of time to the manufacturer's nameplate rating of the equipment connected to the central-station service line, either direct or through transformers. These methods of estimating may be adjusted from time to time as agreed upon at the signing of the contract.



A 300-HP. 2300-VOLT ELECTRIC MINE HOIST AT GREENSBURG, PENN.

THE SWITCHBOARD IN LUZERNE SUBSTATION NO. 2, PUNXSUTAWNEY, PENN.

Actual figures obtained from existing installations show a fixed charge per kilowatt of demand for isolated coal-mine power plants varying from $12 per year in the large plants to $20 per year or more in the smaller ones. On this basis it does not seem unfair for the central station to make a fixed charge of $1 per kilowatt per month of demand plus a graduated charge per kilowatt of consumption, the final rate per kilowatt-hour to depend on the total power consumed.

Tests on different mines show a power consumption varying from 1.5 to 3.5 kw.-hr. per ton of coal mined, values higher or lower than those given being found, depending on the local conditions prevailing at the different mines. Knowing the current consumption per ton of output, the average cost per kilowatt-hour and the tonnage, it is possible to estimate, not only the total consumption, but also the cost for power per ton of coal mined.

Transformers Should Be Centrally Located

In order that the power may be applied efficiently and economically, the transforming equipment should be located as near the center of the load and distribution as possible. Since rotary transformers may be placed in any convenient point, this condition may be obtained at minimum expense and the set may be relocated from time to time so as to secure the most efficient arrangement.

If the cover is not too great, it is usually thought best to make a surface location for transforming equipment, taking the direct-current lines through bore holes to the selected point of distribution inside the mine. When a surface location is made, it should if possible be so located as to render unnecessary the devotion of the entire time of an attendant to its operation. A rotary transformer may also be located inside the mine, but such a procedure is not recommended because of the dirt, fire and water hazards, and also on account of its general inaccessibility. If so located, however, the equipment should be installed in a moisture- and fire-proof concrete room.

The economics of application will be largely determined by the conditions of roof and bottom, presence of water or gas, distances from the working face, main parting and pit mouth, fire hazard, attendance, etc. No set rule can be laid down, but each case should be thoroughly gone over and the application be made on the merits of the investigation. The general features of flexibility of movement and operation also apply to the stationary motor equipment and enable location of fans, pumps, etc., to be selected without reference to the boiler room, at the same time eliminating long lines of expensive and inefficient piping.

It is the general practice to use direct-current motor equipment inside the mine. As central-station power is supplied as alternating current, it is necessary to convert this supply to direct current. This may be accomplished by means of motor-generator sets or rotary converters. Synchronous equipment is often insisted on by the central station or a special discount given when used, or some other consideration made.

In some cases where power is supplied for use in a number of operations belonging to one company, it may be possible to locate one step-down transformer substation reducing transmission voltage to a potential suitable for distribution, say to 2300 volts, in such a manner as to serve the several operations. In this case the power company is usually willing to give an additional discount.

Selection of Converting Equipment Merits Care

Care should be taken in the selection of the rotary-converting equipment, the idea being to install machinery sufficiently flexible to enable that part in use to operate as near full-load conditions as possible. It may be found advisable to install a large and a small set, the former to take care of the day load and the latter to be used at night, the two being operated together on peak loads and under any unusual conditions that may occur.

If it is decided to use a motor-generator set, the initial investment may be capable of reduction on account of the possibility of using the old direct-current generators in the isolated plants as the direct-current elements of the motor-generator sets, either by belting or direct connection, preferably the latter. A direct-connected set is more efficient on account of the elimination of belt losses and requires less floor space than does a belted unit.

In determining the necessary capacity of the rotary-transforming equipment, alternating-current motors should be installed wherever possible. This may be done on such equipment as fans, hoists, pumps, slope hauls, etc. The use of alternating-current motors drawing power from the transmission line or from the secondaries of the high tension step-down transformers obviates conversion losses, thereby reducing the power bill to a minimum. It also reduces the size of the rotary transformer and the initial investment and acts to make the overall cost of operation a minimum.

Where it is necessary to use motors for hoisting, whether from shafts or slopes, the use of alternating-current machines throws the wide and sudden fluctuations of current and voltage onto the transmission line, where they are more easily taken care of than when a direct-current motor is used.

Inasmuch as the power is usually metered on the alternating side of the rotary transformer, a considerable saving in cost of operation can be made by having as little equipment as possible operated by direct current. This saving will usually be found to more than compensate the increased first cost of the installation. The steadier the direct-current voltage, the fewer the burnouts and the higher the efficiency of the equipment operated on the direct-current circuits.

Transmission and Distribution Should Be Efficient

The transmission and distribution systems inside of the mine should be as efficient as possible. It will generally be found that conditions here are capable of improvement by the exercise of care and attention, but it is a difficult matter to bring about this desirable state of affairs. As long as the equipment inside the mine operates and coal may be got out, little thought is given as to how much more cheaply or satisfactorily it might be possible to carry on this work if reasonable care and attention were given to the transmission and distribution circuits. Losses due to poor bonding and feeder-line construction may, and in many cases do, materially affect the efficiency and upkeep of the electrical equipment as well as the output of the mine and the power bill.

Where a motor-driven fan is employed, care should be taken in the location of the equipment, consideration being given for both present and future requirements. The amount of power that may be wasted through uneven or ununiform air passages and through allowing accumulations of rock on the floor of the airways may be considerable, while the saving that may be effected by keeping the passages clear more than justifies the expense.

When opening a new mine, it is usually advisable to employ a small fan motor, increasing its size when it becomes inadequate to perform the work required. Two-speed fans may be used when a small amount of air is necessary during periods of shutdown or at night and on Sundays, but care should be taken to select a motor that will have sufficient capacity to satisfactorily meet full-speed requirements.

Hoisting Should Be by Alternating Current

For shaft hoisting or slope haulage work it is usually advisable to use a variable-speed alternating-current motor. This type possesses features of design and construction that enable it to perform satisfactorily under the severe conditions imposed, and being alternating current it may operate independently of the direct-current equipment.

In some cases it may be desirable to use a direct-current motor for the hoist, in which case a suitable motor-generator set, either with or without a flywheel, may be employed. It is not generally advisable to attempt to convert an old steam-driven hoist to motor drive, as it will be found cheaper and more satisfactory to buy a new hoist equipment and sell the old one for whatever it may be possible to obtain.

Mine pumping is a desirable central-station load, since it is steady 24 hours per day. Pumping by electricity is more reliable and economical as well as more flexible than by steam or compressed air and acts to increase the operating-load factor of the installation. The equipment, furthermore, is self-contained and portable.

Sale of Power Requires Skill and Experience

The sale of power to coal mines on a mutually satisfactory basis necessitates a special knowledge and experience in this particular field. Patience on the part of the central-station representative is essential, as it requires time and detailed investigation to obtain the data and information to make possible the submission of an intelligent proposition.

Continuity of service, especially where pumps and fans are concerned, is essential. It is generally advisable, therefore, to employ the services of a competent consulting engineer when considering the advisability of using central-station service either as a substitute for locally generated power in a mine already open or in an entirely new operation. Many men who are able executives and efficient and successful in their own line of endeavor have met with trouble through their failure to recognize that the engineering and executive side of mining are totally different. Success can come only from a full recognition that expert advice based on long experience is essential to safety and efficiency in the production of coal.

The favorable development of a coal-mining load abounds in profits to the central station, particularly if it was primarily a lighting proposition, the increased load factor making it possible to sell power at a low rate. The great difficulty confronting the company first entering this field is a lack of information relative to the price at which it can afford to sell power. Any effort on its part to regulate the various peak loads according to its capacity in order to determine the rate, rather than by placing itself in a position to handle the demand of its customers under all conditions, can result only in uncertainty or confusion regarding the ultimate outcome. Installation of the necessary equipment on the principle of being a public servant rather than for the benefit of a single customer is the only safe method of determining what the traffic will bear.

Why Are Strikes at Coal Mines of Such Frequent Occurrence?--I

By Hugh Archibald*

SYNOPSIS—The first part of an answer to Mr. Le Baron's question as to the reason for so much strike turmoil in mining. The writer declares that the rate per ton paid to the miner is sufficiently high, but states that no one seems anxious to see that he is aided in producing a large output.

In the editorial in the issue of May 22 entitled "Can Someone Enlighten Mr. Le Baron," the question was asked whether there is any need for the continual strike turmoil in mining. In the final analysis it will have to be conceded that strikes are unnecessary.

Strikes instead of being biennial or triennial affairs in the different mining districts can be reduced to a negligible minimum. But to accomplish this a few ideas which are now considered excellent, but which are condemned because they are not considered as constituting "good business," will have to be recognized as working principles.

These principles are three: 1. Every man must earn a day's pay. 2. Every man desires to live decently, and his scale of living rises with his ability to pay for it. 3. Nothing exists without a cause, and the United Mine Workers of America would not exist if there was no need for it. These things are so tied up with each other that a discussion of them almost runs around in a circle, and the end of the argument depends on the point of beginning. But there are changes to be made before peace will settle over coal mining—a peace that is possible and would be advantageous to the operators and to the workmen.

The Work Rather Than the Wage Tells

Whether the first of these principles is fulfilled—that a man must earn a day's pay—depends on whether the mine is organized partly for the purpose of providing that work or is planned solely with other purposes in mind.

The men in a mine can be divided into two general classes according to the manner of paying them—one class is paid by the day and the other by the piece.

The first are generally known as daymen or company men and the latter as miners. The pay of the daymen is definite and is the same whether there is much or little to do. These men may not receive as much as the miner, but it is regular and is not high one month and low the next. The earnings are constant, so that at the end of the year the company man is financially in a better position. As a result it is easier to get men to do company work than to mine coal. The main strength of the union has lain in the miners, who are numerically greater and who suffer the greatest variation in wages.

The following data are taken from a two-week payroll at a typical anthracite mine: The number of men drawing less than $1 a day based on the number of days they worked was 23; those getting between $1 and $2, 45; those from $2 to $3, 50; from $3 to $4, 32; from $4 to $5, 16, and over $5, 18. Such variations cause discontent.

In Coal Age for Jan. 9, Vol. 7, p. 45, it is reported for six counties in Arkansas that the average net earnings for the men working in rooms was $538 for the year and for the bottom men $529. Comment is then further made that "the average earnings of miners and men at other classes of work will be less than last year. Practically all the mines are crowded and a slow turn of cars generally prevails. The number of men locked out or on strike for one cause or another during the past year was over 46 per cent. of the total number employed at the mines."

It is clear, therefore, that there are more men than are needed for the output required, and it is fair to assume that there is a high cost of mining. Where there are too many loaders there are too many working places, and the transportation force having to visit all these workings has to be made unduly large. In turn the inefficiency of the haulage system results in the idleness of the men.

In two of the counties in Arkansas the earnings of the company men are greater than those of the men in rooms, though custom has it that they should draw the lower pay. The difference between the highest and the lowest of the company men is $270 and that between the roommen $390.

Minimum Wage Is the Distressing Problem

The low average of the mine workers' earnings is not the cause of the unrest. The discontent rather has its source in the inadequate pay of those who do not earn the average wage. The percentage of low pays may be balanced by a number of high pays with a good average as a result, but what should be desired is a greater equality in the amount earned. Much difference in the monthly income of the men indicates a poor arrangement in the mine, from which results a large difference in earning opportunity. This state of affairs is generally accompanied by unnecessary expense to the company.

It is often hard to interest a manager in the arrangement of the work in his mine so that the miners can earn a day's pay or so that there can be a more uniform wage. There is an idea in the minds of many bosses which has been handed down for many generations that a man should not be allowed to earn high wages. I, like many others, have held back a part of a man's pay when it was over a certain amount until he had a lower pay with which to offset it for fear that the "big boss" would make trouble for me for allowing the man to earn so much money, though he was only getting paid at the standard rates fixed by those over me. On the contrary I have never been censured for low pays, numbers of which have appeared on the pay statements of my subordinates.

Keeping a man's pay low was merely self-preservation in the days when a workman who was proprietor of his business had a helper who might save up enough money to start in business for himself and enter into competition with his former employer. It is doubtful, however, if any miner nowadays could save up enough in a lifetime to open up a mine for himself with all the equipment that is now needed. There need be no fear that if a miner earns a good pay he will create competition in the sale of coal.

---

*Efficiency engineer, Scranton, Penn.

It may be argued that the miners are making a day's pay where they are not lazy. That is not the case in many mines. To be sure the operator must bring pressure to bear upon the worker to get him to work regularly and do a full day's work. But this is not the principal difficulty, and the difference in earnings is small where opportunities to load coal are reasonably equal.

The rates paid for mining are high—almost too high. In the union districts in central Pennsylvania the price for pick coal is 72c. a ton. This is paid whether the mining is in rooms and the coal hard or whether it is in pillars which have been standing and the coal is crushed. In the latter case a man can dig and load a ton in 20 min. At that rate he ought to earn $8.64 a day, allowing 50 per cent. of the time for resting. But what happens? He does not get enough cars to earn anywhere near that amount.

I have heard it stated that the men in central Pennsylvania earned more money when pick coal was 35c. a ton than they do now. But the past and present conditions have not been taken into account. One man telling about "olden times" at one mine said: "There were not many men here then, and the boss used to be around all the time telling you to load more. We made good money in those days." The blame for the loss in earning power is often angrily put on the union, whereas it ought to be partly borne by the men running mines for not maintaining correct conditions—men in proportion to the equipment and bosses in proportion to the mine.

Rates of Pay Should Make an Equal Wage Possible

There is an inflexibility in the rates paid for work which makes an inequality in the earning power of the men. Rates are generally the same for all parts of a mine or for all parts of a vein. In one anthracite mine $1.58 is paid for a 2-ton car of coal whether the vein is 8 ft. and free blowing or 4 ft. and hard coal. In the bituminous regions the same price is paid for pick coal whether it is in rooms or in crushed pillars. Business has been business in establishing the rates, and in any argument between employer and employee over what the rate should be, the attempt on both sides has been to charge all the traffic would bear. There has been no measurement of work by which attempts could be made scientifically to get an equitable basis for payment. Measurement of work is just as practical in mining as in manufacturing, where it is now being largely done.

Although the payment is made according to the ton or car loaded, responsibility for the amount of work done cannot be wholly cast aside by the management. Men are turned loose in a mine entirely too freely and expected to work out their own salvation. They cannot do it, for they do not work alone, but are dependent upon others for the opportunity to work.

The drivers, being paid by the day, are not anxious to deliver more cars than are necessary to keep their jobs and so neglect the miner. In consequence the miner does not earn as much as he might. One can hardly blame the driver so long as it is a fixed principle in life to get as much for as little as possible. Everyone is doing it, and he would be "kidded" by his friends if he did not practice it. Universally a mine is so undermanned by bosses that no work can be followed up, and the neglect of duty and failure to coöperate can become so common that the miners frequently suffer from needless delays.

Were the miner cutting the coal himself and delivering his own cars to the foot of a shaft or to a large side-track, he would be more independent and could be more reasonably blamed for not earning his pay. Such a system exists in some mines in England, but in this country we use larger cars and deliver them to the miner.

Miners Suffer from the Lack of Organization

The individual in a mine depends on the management to organize the work so that the proper balance is kept between the various machines and the work of each man or group of men.

A superintendent recently remarked that it is hard to stir up trouble at a mine if the men are being decently treated and are earning a day's pay. It will be found that the strength of a union increases at a mine in proportion as there is more cause for discontent. But this is not to be regarded as an argument that the men should be paid whether they do any work or not.

Increased earnings of the individual can be reflected favorably on the cost sheet. A man who is working a piece of coal which has been formerly neglected and is so situated that he is given only a car or two a day and whose earnings in consequence are low is likely to be a source of trouble. When it is necessary to keep a man and a mule for only a few cars a day, the transportation charge will be high. The cost of gathering was taken in one mine and found to run from 2½c. to 25c. The total cost for haulage was high because on only a few roads were there enough men to give a driver a full day's work. When the work was apportioned so that there were enough men on each road, the cost fell.

Need for a Full Turn of Cars for Each Man

It would be more advantageous to the workmen if the union leaders, instead of making demands for further increase in the rates of pay, asked for a better organization of the work so that the men got an equal number of cars. Rates are high enough now so that no man need overwork himself in earning a good pay. In a boiler-room a fireman will shovel into the furnace from 18 to 20 tons a day, which is more than a loader will load into cars.

One well-known union leader has been quoted as saying that 15 tons was not too much for a man loading after machines, and the union representatives agreed to a task of 12 tons at one mine. When one gets into the complex changing conditions of an anthracite mine it might seem a little doubtful whether this could be done, but again it is a case of the arrangement of work rather than a crying need of an increase in rates.

A recent number of *Coal Age* gives a high output per man at one mine of 5.1 tons a day, but even this is strongly in contrast with what is admittedly possible.

Under the present general manner of payment the only cure is to promulgate the idea that each man should produce a large tonnage per day. An increase in their output will be of advantage to the miners, as they are paid by the ton. It will also be to the interest of the company, for an increased output per handling unit will result from the proper organization of work by which the larger product is secured. Though there is no one cure for all ills, the application of the principles of efficiency to mining will greatly help to alleviate the conditions which are now a frequent and natural source of much irritation.

Miners Who Don't Mine

There are nearly a hundred thousand employees in the collieries of the anthracite coal fields of Pennsylvania who mine no coal. The exact number in 1913, the latest figure available, was 96,991. The men who mine and load the coal are the miners with state certificates who drill holes and blow down the coal with explosives, and the miners' laborers who assist the miners in drilling the holes and load the loose coal into mine cars. There were 44,346 miners in 1913 and 33,973 miners' laborers.

Thus the army of men who are employed at ventilation, transportation, drainage, maintenance and the preparation of the coal for market outnumbers by over 18,000 the men who are actually mining and loading coal. In other words, it takes more men to keep the mines safe and in condition to be operated than it does to mine the total output of coal.

There are nearly a hundred different positions in and about every colliery for which special training is not only advisable but often indispensable. The mere terminology of the various positions is confusing. There are doorboys, or "patchers," drivers, runners, bratticemen, masons, timbermen, tracklayers, foremen and assistant foremen, firebosses, pumpmen, blacksmiths, carpenters, engineers and firemen, slatepickers, breaker boys, and a host of others.

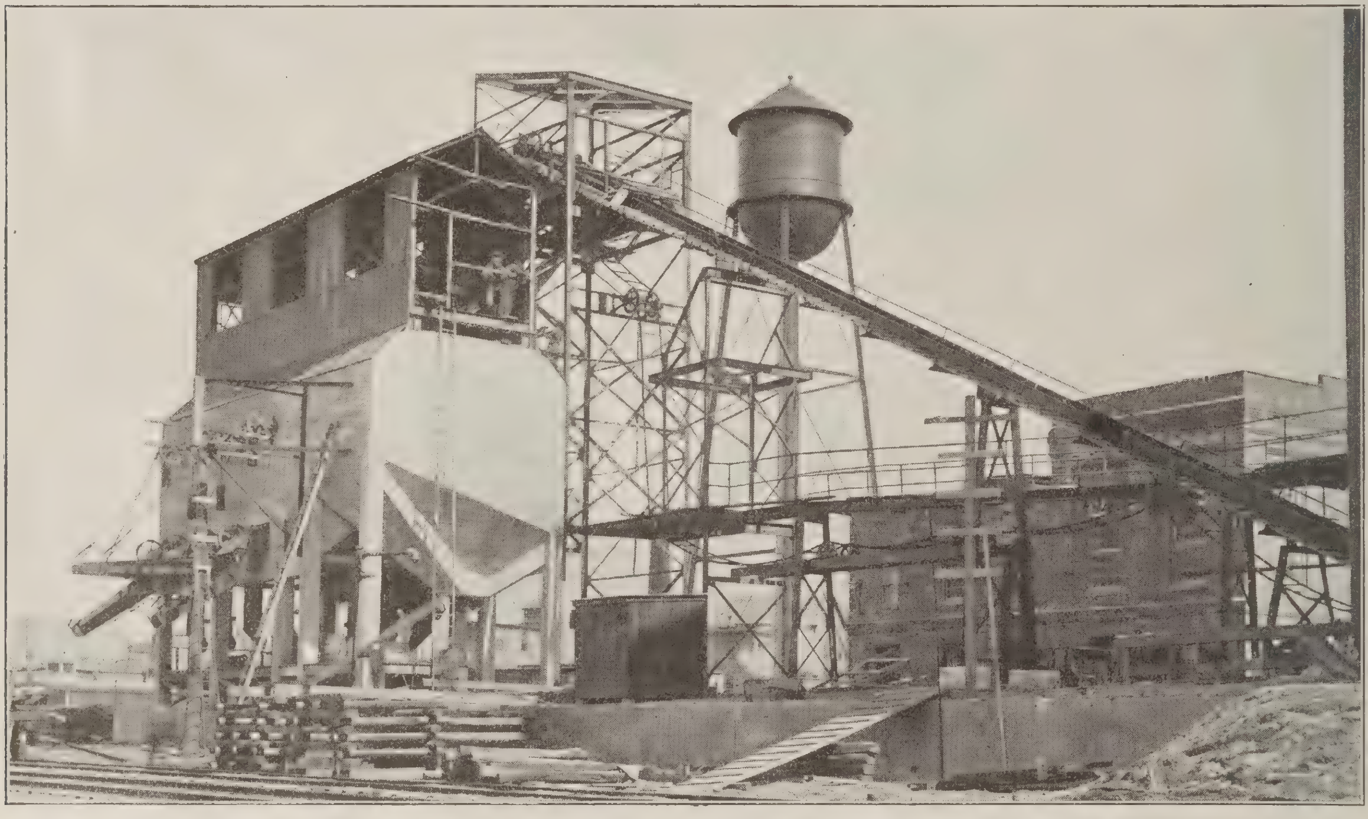
The excellent mine schools which now exist throughout the anthracite region either under the supervision of the local school boards with state aid, maintained by the operators, or conducted by the local Y. M. C. A.'s are now providing the special instruction and training necessary for many of these positions. Mining problems are discussed and much information is also disseminated through the mining institutes which are held throughout the region.

Handling Coke from Retorts

By R. G. Read*

The handling of coke at retort houses is receiving a thorough study with the idea of eliminating labor and making a better preparation of the product. Extensive advertising campaigns in various parts of the country have resulted in a keen demand for domestic coke to take the place of anthracite coal. To successfully meet this demand it is necessary to make a careful preparation of the coke including a through sizing to correspond to the various grades of anthracite.

Coke is fragile, absorptive and abrasive, and may be likened to an egg, a sponge or an emery wheel. A successful handling equipment must therefore convey and screen with a minimum breakage, quench without saturation and provide against excessive wear on the machinery.



WISCONSIN GAS & ELECTRIC CO.'S PLANT FOR STORING AND SIZING COKE WITH DE BROUWER CONVEYOR FOR CONVEYING AND QUENCHING THE PRODUCT AS IT LEAVES THE RETORTS

A successful machine for conveying and quenching the hot coke as it comes from the retorts is the De Brouwer conveyor. This was originated in Germany and is in extensive use abroad. A modification of the De Brouwer suited to American conditions has been perfected and installed in a number of plants in this country, particularly in the New England States.

This conveyor consists of two strands of special chain with crossbars spaced about 24 in. centers. This moves slowly in a watertight cast-iron lined steel trough. The quenching is accomplished by sprays placed above the carrying run of the conveyor. By this arrangement the amount of water can be easily adjusted so as to thoroughly quench the coke without soaking it, as the thickness and speed of the moving body of coke are under control. The excess water is drained by means of a water grate in the conveyor trough. This grate is in the form of screen bars so spaced as to refuse breeze, but pass the water.

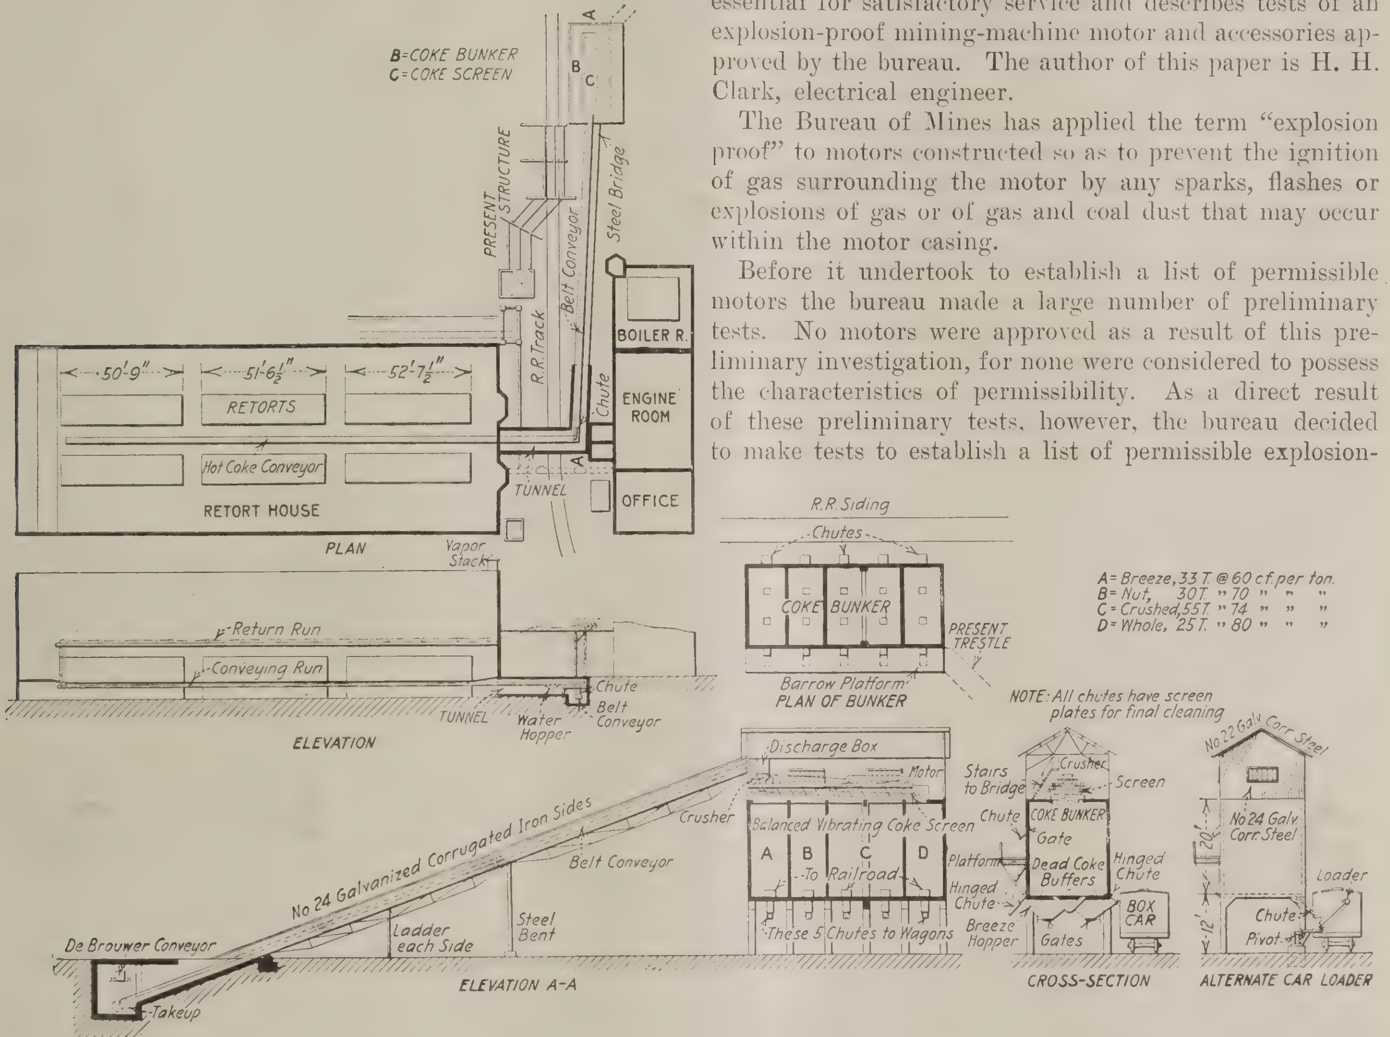
---

*Fisher Building, Chicago, Ill.

The grading of sizes may be accomplished by either a revolving screen of the open type or by a balanced vibrating screen. The vibrating screen is preferable for the fine sizes as it gives the body of coke a thorough agitation without dropping it as is the case with the revolving screen.

A typical and uptodate handling plant of this type is shown in the accompanying drawing. The operation is as follows: The hot coke is pushed from the retorts into a hot-coke car which travels on overhead tracks and serves as a chute for each group of retorts. The coke passes by gravity to the carrying run of the De Brouwer conveyor, which quenches and delivers it to a belt conveyor.

This belt conveyor takes the coke to the screening station, where it may be either crushed or not and screened to make the various sizes indicated. Provision is made for storing the coke in the yard either screened or as it comes from the oven. The coke from the storage yards may be returned by means of other equipment to the screening station when desired. The plant is being installed for the Wisconsin Gas & Electric Co. at Racine, Wis., by R. H. Beaumont Co., of Philadelphia, Penn.



PLAN AND ELEVATION OF THE GAS AND COKE PLANT OF THE WISCONSIN GAS & ELECTRIC CO., RACINE, WIS.

Permissible Mine Motors

Among the Bureau of Mines' investigations dealing with the means of lessening such dangers as attend the use of electricity in the mining industries, it has undertaken one that has for its purpose the establishment of permissible explosion-proof motors for use in places where an electric spark or flash might ignite inflammable gases or dusts.

Technical Paper 101, "Permissible Explosion-Proof Electric Motors for Mines; Conditions and Requirements for Test and Approval," which has just been issued, mentions the details of construction that the bureau considers essential for satisfactory service and describes tests of an explosion-proof mining-machine motor and accessories approved by the bureau. The author of this paper is H. H. Clark, electrical engineer.

The Bureau of Mines has applied the term "explosion proof" to motors constructed so as to prevent the ignition of gas surrounding the motor by any sparks, flashes or explosions of gas or of gas and coal dust that may occur within the motor casing.

Before it undertook to establish a list of permissible motors the bureau made a large number of preliminary tests. No motors were approved as a result of this preliminary investigation, for none were considered to possess the characteristics of permissibility. As a direct result of these preliminary tests, however, the bureau decided to make tests to establish a list of permissible explosion-proof motors, and issued its Schedule 2, "Fees for Testing Explosion-Proof Motors." This gave the general conditions under which motors could be submitted for trial and the fees to be charged for making such tests. Technical Paper 101 sets forth more fully than Schedule 2 the details that the bureau considers essential to satisfactory explosion-proof motor construction.

The Bureau of Mines considers a motor to be permissible when it is the same in all respects as the sample motor that passed certain tests made by the bureau and when it is installed and used in accordance with the conditions prescribed by that body. The paper gives the requirements for approval of motors, outlines the nature of the approval of the bureau and describes the approval of an explosion-proof coal-cutting equipment.

Co-operative Mining in Illinois Threatens the Industry

SYNOPSIS—A summary of the peculiar status of coöperative mining in Illinois. Union members of one company have already thrown down the gauntlet to the United Mine Workers of America and the situation is replete with serious possibilities. The movement is spreading rapidly and is a menace to legitimate mining companies.

Coöperative enterprises of different kinds have been tried time and again, but as a rule they have seldom proved an economic success. Coöperative coal mining in the Illinois field, however, does not seem to fall in this class. It has been in operation for some time, and of late has spread so rapidly that it even threatens to become a national issue.

Coöperative mining in Illinois originated some years ago, and was more or less directly due to railroad ownership of mines. It is generally believed that the roads quoted a delivered price, including both the cost of the coal and the freight rate, that aggregated much less than an independent operator could compete with. This eventually wound up in a spectacular rate war among the trunk lines, during which freight rates were slashed down to as low as $2 per car to East St. Louis, as compared with 32c. per ton at present.

It was out of this war that the independent operators, seeking relief from the untenable conditions prevailing, hit upon the plan of coöperation. The miners themselves had been working on such poor time that they were reduced almost to extreme poverty and were eager to accept any change whatever.

Union Strongly Opposed to Such Coöperation

The method of operating the coöperative mine was brought out fully before the scale committee meeting at Peoria, Ill. It appears that the miners, who are all union men, are assessed the difference between the cost of production and the ultimate selling price. Thus, although they are nominally receiving the full wage scale, they are obliged to rebate the company for losses incurred by working the mine when adverse marketing conditions prevail.

At this same meeting the officers of the United Mine Workers of America assured the independent operators in attendance that drastic measures would be taken to do away with these coöperative mines. There are now about 10 concerns, having an aggregate daily capacity of 8000 tons, who are operating on a coöperative basis, and the indications are that this may very probably be doubled within a year, unless aggressive action is taken. The operators more closely in touch with the situation are very skeptical of the union's power to cope with the matter. It is generally felt that should the organization resort to the drastic measures mentioned, the local union will give up its charter and the mine will become nonunion. This would, of course, be a serious blow to organized labor.

Some of these companies are incorporated under the laws of Illinois; others are copartnerships. In either case the miners buy shares, usually from $100 to $200 each. The number of shareholders runs from 20 to 100, depending on the size of the mine. Some of the mines work only coöperatives, but the greater part of them work some members of the U. M. W. of A. When there is a demand for coal, all the companies work all the union men they have room for.

In the case of the Oakland Coal Co., located near Belleville, Ill., the loss Feb. 15 to Mar. 31, 1914, equaled one-third of the union scale. In other words, if a man worked 10 days at $3 per day, he received $30 and paid back to the company $10. This statement is based on an affidavit made by a stockholder of the Oakdale Coal Co., which was as follows:

Belleville, Ill., April 18, 1914.

To Whom It May Concern:

I have been and am now working for the Oakdale Coal Co. I own six shares in this company. I should have drawn $22 on Mar. 15, but I drew none of this and had to pay in $5 to defray expenses.

I should have drawn $42.50 on Mar. 30, but they paid me $12.50 and the other $30 was used to defray expenses.

I should have drawn $77 on Apr. 15, but I was paid only $57 and the other $20 was used to defray expenses.

Whenever we do not get enough for our coal we assess each man a certain amount and deduct it from his pay.

In other words, I mean, if we do not get enough money from the sale of our coal to meet our payroll, we assess each man a sufficient amount so that the money from the sale of the coal and payroll will balance.

State of Illinois,
County of St. Clair

, residing in the city of Belleville, county of St. Clair, state of Illinois, personally known to me, Stephen A. Butler, a notary public, in and for the above county, appeared before me this 18th day of April, 1914, and made affidavit that the above statement is true and correct.

STEPHEN A. BUTLER,
Notary Public.

Two of the ten coöperative mines were sunk by the miners—Golden Rule, near Lenzburg, and Mulberry Hill, near Freeburg, both on the Illinois Central R.R. On account of the stress of competition, the mines at these two small towns were closed about 1910. The company then owning them, having mines in other localities on the Illinois Central R.R., refused to lease these two plants to the miners, who then opened mines themselves.

Strong Arguments for Coöperative Mining

A great majority of the miners of Illinois are thrifty, saving men, and as soon as they think they are permanently located, begin to buy lots and build homes, getting the money mostly from building associations. Freeburg and Lenzburg offered no other opportunity for employment, and if the miner moved away his home would become valueless. The business men faced practically the same condition; the moving away of the miners meant the destruction of their trade and an enormous shrinkage in the value of their real estate.

There being a 7-ft. seam of coal at a depth of 90 ft., the miners leased the land on a royalty basis of 3c. per ton. Mines were sunk at Freeburg and Lenzburg, the miners doing the labor and the business men in the respective towns advancing the necessary funds. Since commencing operations these properties have repaid all money expended on them and the miners now not only own them both, but have protected their properties also.

The Bessemer Coal Co., which owned the original mines near Freeburg and Lenzburg, went into the receiver's hands about 1912. On sale of this company's property, the Freeburg mine was purchased by L. Senior, of Belleville, and the Lenzburg by the Tierre Coal Co. Since Apr. 1, 1914, neither of these properties has been operated, while both of the coöperative companies have been working every day. The eight other coöperative companies lease their mines from operators who were unable to make both ends meet. The royalty paid runs from 3c. to 6¼c. per ton of mine-run. All the coöperatives belong to the U. M. W. of A. and are supposed to get the full scale, although none of them do.

DIFFICULT POSITION OF THE MINERS' UNION

The last coöperative mine was started Apr. 1, 1914, 100 miners purchasing the operation of the Winkle Coal Co., located in Winkle, Ill. The mine was acquired without a cash payment being made, the men agreeing to make a part payment twice a month until the agreed price was liquidated. Upon hearing of the Winkle coöperative organization, the officials of the U. M. W. of A. began to act. An executive board member was sent there, who shut the mine down and called a meeting, at which he told the men they would have to give up the mine or he would take their charter away. By a large majority vote the charter was relinquished. The mine is still in operation and no further effort on the part of the U. M. W. of A. has been made to stop it.

All the coöperative mines are located in the "Inner Group" and take the lowest freight rate to East St. Louis and St. Louis—32c. and 52c. per ton. The production is sold by brokers in St. Louis, the price usually being on a basis of 79c. or 80c. f.o.b. cars at mine for run-of-mine coal. Of this the broker takes 3c. for his commission. He settles with the producer twice a month.

THE LEGITIMATE OPERATOR BETWEEN TWO FIRES

The average cost of mine-run coal with the legitimate operator, f.o.b. cars at mine, runs from 90c. to 95c. The only operator who can compete with the coöperative mine is one who owns both mines and railroad and is willing to give away part of the freight profit with his coal. At a hearing before the Interstate Commerce Commission in St. Louis last fall, several witnesses testified that the St. L. & O. F. R.R. Co. and the St. L., T. & E. R.R. Co. made a practice of doing this. Of course the excessively low price is made only during the dull season, from Apr. 1 to about Aug. 1.

Contracts for coal that run for a year or two are generally let at prices that show a small profit to the legitimate operator, but open-market business in the dull season is practically all taken by the coöperatives and railroad-owned mines. As a consequence, legitimate mines do not work over two days per week, and the companies suffer severe losses during this time.

The coal fields adjacent to St. Louis are ideal for the coöperative. The seam is near the surface, is from 6 to 8 ft. thick, the roof conditions are good and the coal shoots readily on the solid. The average miner can produce 10 tons per day, for which he receives 61c. per ton run-of-mine, making his gross earnings $6.10 per day; powder, tool sharpening and oil aggregate about 80c. per day. While the coöperative miner gets less than the scale during the dull season, he realizes much more during the busy season. In a series of years, his returns will be more than the mining scale, besides which he works from 50 to 100 days more per year than he would in the legitimate mines.

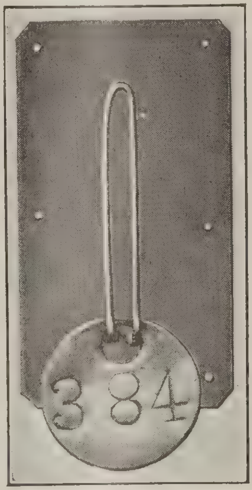
Owing to these conditions, many operators are willing to lease their properties to the miners, and if the U. M. W. of A. does not interfere, this method of mining will spread rapidly and will eventually displace the legitimate operator, and probably the union also in Illinois.

There are several coöperative mines working in the Peoria district and four are now being started near Springfield. The following is a list of the coöperative mines:

Name	Railroad	Location	Tons
Summit Coal & Mining Co.	L. & N.	Belleville	1000
Fullerton Coal Co.	L. & N.	Belleville	1200
Eldnar Coal Mining Co.	L. & N.	Belleville	800
Oakdale Coal & Mining Co.	L. & N.	Belleville	500
Mulberry Hill Coal Co.	I. C.	Freeburg	1200
Star Coal Co.	I. C.	Freeburg	1200
Golden Rule Coal Co.	I. C.	Lenzburg	600
Harding Mine (Glendale)	I. C.	Belleville	500
Cutler Mine	W. C. & W.	Cutler	350
Winkle Mine	I. C.	Winkle	750
City Coal Co.	L. & N.	Edwardsville	500
			8600

New Check Hook for Mine Cars

A new form of check hook recently invented by J. T. O'Neal, of Danville, Ill., is shown in the illustration. The hook is made of No. 14 spring steel wire, and is neatly attached by soldering the prongs on the lower end of the hook to the back of a galvanized iron plate, 2 in. in width and 4 in. in length, made of No. 27 gage material. The plate is attached to the side or end of a wooden mine car with six shingle nails. In the case of fastening to a steel mine car, small rivets would be used. The inventor devised this check hook while working as a car builder at the Vermilion mine of the Bunsen Coal Co., the idea suggesting itself on account of the number of checks that were lost from the mine cars while in transit when attached loosely to a nail on the mine car—the old method. Several of the new-style hooks were placed in service at the mine mentioned, and they proved to be of such advantage that there are now over 800 of these hooks in service at Vermilion mine.



THE HOOK WITH MINER'S CHECK ATTACHED

Mr. O'Neal explains the following features, which should recommend his form of hook for use by mine operators: The miner's check can not be released or lost except by accident to the mine cars while in transit, and is only removed by the dumper when the car has reached the dumping point in the tipple. No trouble is therefore experienced either by the management or the coal miner as the check on the car is never lost.

The check hooks used at the mine mentioned have been in service for more than a year, and the excellent results accomplished by the use of this form of check hook have been fully demonstrated in actual practice.

Steel Breaker at Hazleton, Penn.*

By C. Stuart Phillips†

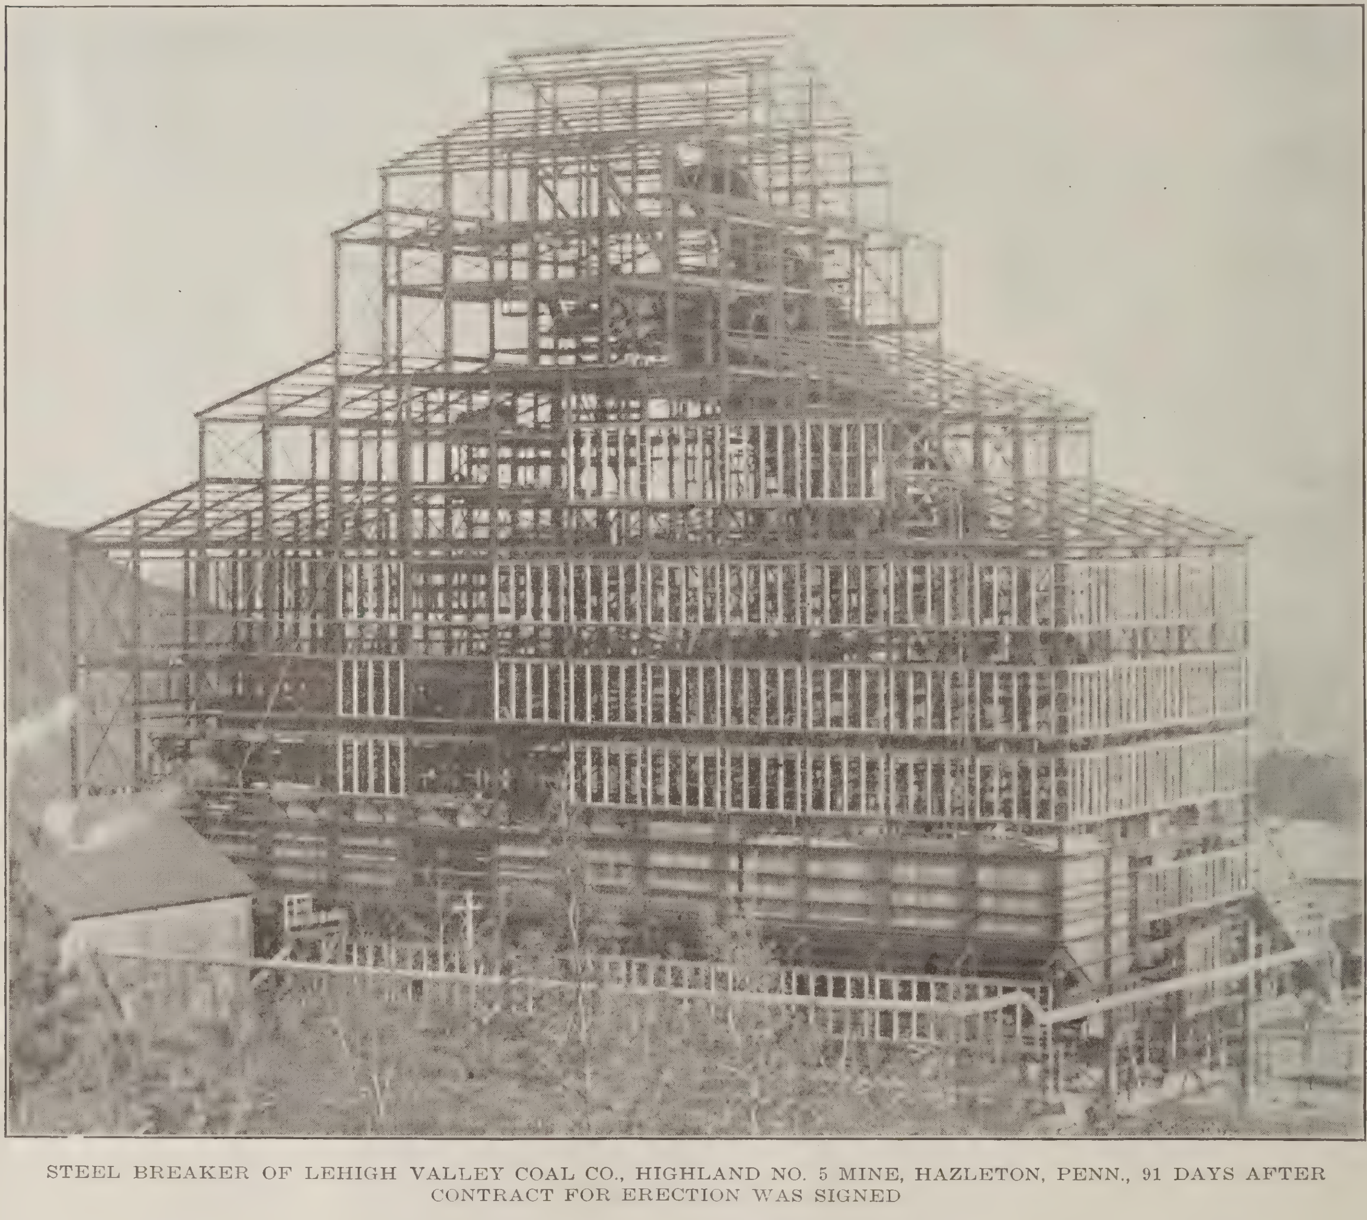
SYNOPSIS—A steel breaker at Hazleton was designed and erected in 91 days and, if expectations are fulfilled, will be ready for business 6½ months from the time the contract was let. Only the framework is fireproof.

Practically the last great industry to cling to the use of heavy timber framing for permanent construction has been the anthracite industry of Pennsylvania; but within the last three years the wooden coal breaker has started to go the way of the wooden ship and the wooden bridge.

One of the first companies to abandon the old type was the Lehigh Valley Coal Co., which three years ago rebuilt its Mineral Springs and Franklin breakers of structural steel. In the short time following there have been placed in operation two other steel breakers in the Wyoming Valley, two in the Schuylkill district, and at present three more are in process of erection in the former district and two near Hazleton.

The timber breaker is highly inflammable, framing, floors, siding, roof, pockets and bins being of wood, usually yellow pine. Three disastrous fires, one with loss of life, within the last year have emphasized its danger. The Ewen breaker of the Pennsylvania Coal Co. in the Wyoming Valley, the Lattimer No. 4 breaker of the Pardee Coal Co., and the Highland No. 5 breaker of the G. B. Markle Co. in the Hazelton district each burned to the ground, being completely lost in two or three hours. In the last-mentioned case the fire was with difficulty kept from spreading down the slope to the mines, the whole plane having to be dynamited to prevent this occurrence.

All these breakers are being rebuilt of steel, and the Markle company is replacing several of its timber planes



STEEL BREAKER OF LEHIGH VALLEY COAL CO., HIGHLAND NO. 5 MINE, HAZLETON, PENN., 91 DAYS AFTER CONTRACT FOR ERECTION WAS SIGNED with steel, so that conflagrations, if started, will not spread from the wooden breakers to the mines.

---

*Published in "Engineering News," July 1, 1915.

†G. B. Markle Co., Jeddo, Penn.

The erection of the new breaker at Highland No. 5 has been interesting because an enviable record for speed has been established for this type of construction. The old breaker burned on Jan. 15, 1915, and the contract for the new steel structure was signed on Feb. 9. The Guerber Engineering Co., of Bethlehem, Penn., designed both the general structure and its details and furnished and erected the steel.

Until the breaker was reërected the coal had to be hauled from Highland No. 5 mine to a breaker 2 mi. distant to be crushed, cleaned and assorted. This entailed much expense, and consequently the G. B. Markle Co. let the contract for the rebuilding of the tipple with a provision that a $75-per-day bonus or penalty be added or deducted respectively from the contract price to date from May 19, which was 100 days from the signing of the contract.

DESIGNED AND ERECTED IN SIX AND A HALF MONTHS

Seven designers were sent to the G. B. Markle Co.'s offices at Jeddo the day after the agreement was concluded. These men worked 14 hr. a day, consulting the coal company's engineers as to panel lengths, machinery locations, loadings, etc. As fast as one section was designed and approved, prints were sent to the detailers at Bethlehem. On the approval of the first batch of details the shop started fabrication.

The design was finished by Feb. 26, and the following day the first shipment of steel was received on the site. The previous week the erecting gang had come on the ground and unloaded their tools and erected the derrick, so that no time was lost. The débris had been cleared away and the foundations prepared by the coal company's forces. The working time was 10½ hr. a day, seven days a week; but much time was lost, 12 days in all, on account of the bad weather.

The field organization consisted of an unloading gang, a derrick gang, a handline erecting gang and four riveting gangs. The derrick used was a stiff-leg 5-ton 100-ft. boom steel derrick, set in the center of the building. The latter being 158 ft. long and 75 ft. wide, the corner columns were reached from the center set-up. When the erection had progressed to the 35-ft. height the derrick was jumped up to that floor and again to the 75-ft. height, from which elevation the rest of the steel was set, 148 ft. being the maximum height in the center of the building, stepping down to about 90 ft. at the two ends.

At each move of the derrick three-quarters of the steel was set with the boom outside the stiff-legs; the boom jumped inside the legs to erect the remaining quadrant. Two panels near the center were left open, as the derrick frame was hoisted up bodily each time the rig was raised, using the boom as a ginpole. When the rest of the erection was completed the derrick frame was dismantled and lowered to the ground and these two panels erected with the boom as a ginpole.

The wind bracing, channel girts for the corrugated siding, etc., were erected by handline. The riveting was done by compressed air furnished by the coal company, Ingersoll-Rand pneumatic hammers being used. My experience has been that the Boyer hammer has usually been the most satisfactory on all-around bridge and building work, but the Ingersoll-Rand proved the best on this work, being shorter than the Boyer and more easily manipulated in the close quarters afforded by the wide flanges of the Bethlehem sections.

Altogether there are 736 tons in the structure, 25,000 rivets, 8300 bolts, and 900 tie-rods, small castings, etc.; 3000 pieces were erected by the derrick and 1700 by handline.

The first column was erected Feb. 28 and the first rivet driven Mar. 14. The job was completed and accepted on May 11 (the date the accompanying photograph was taken), 91 days after the signing of the contract and 8 days before the contract time expired.

The coal company's carpenters started work on Apr. 18 on the wooden bins, pockets, floors, walks, chutes, etc., and the machinists began installing the heavy machinery shortly afterward. The work of covering the sides and roof with corrugated iron has also been started, and the breaker will probably be in complete operation by Aug. 1, or 6½ months after the destruction of the old timber breaker.

STEEL COSTS ABOUT 60 PER CENT. MORE THAN WOOD

Perry Sneathen had charge of the design and Victor Pfeiffer superintended the erection for the Guerber Engineering Co. The G. B. Markle Co.'s interests were placed in my charge, as engineer in charge of erection.

In comparing this type of steel breaker with the standard timber construction, the following comparisons can be made:

1. Cost—The contract price for the steel was between $65 and $70 per ton, totaling $44,000. The framing for a timber breaker of like dimensions would necessitate about 510 M of lumber and would cost $25,000. While the initial cost of the steel is greater, the smaller insurance rates will in time equalize the two.

2. Speed of Erection—The steel structure was erected, complete, in 60 working days, practically the time required to raise a timber frame. The first delivery of steel, however, was made 18 days after signing the contract. Yellow-pine timbers 12x12 in. and 14x14 in., in sufficient quantity cannot be obtained from the South in less than 60 days after placing an order; thus six weeks' time was saved by using steel construction.

3. Fire-Resisting Qualities—The steel-frame breaker is far less inflammable than the timber frame. It is, however, by no means fireproof unless the remainder of the structure is in keeping.

In the breaker in question there is so much wood in the flooring, walkways, pockets, bins, window frames, etc., that it is quite possible that a fire could break out and generate sufficient heat to soften and weaken the steel columns and cause the whole structure to collapse. If a real fireproof structure is desired, the floors, dump and jig pockets and loading bins should all be of reinforced concrete, the walkways should be of iron, and metal sash should be used for windows. In this connection it may be stated that wooden pockets and bins have to be renewed every five years. Reinforced-concrete walls costing 60 to 75 per cent. more in initial outlay would probably last three times as long.

⁂

Liability of Corporation's Successor—When a coal company transfers all its assets to another company, practically ceasing to exist, without having paid its debts, the purchasing corporation takes the property subject to an equitable lien in favor of the creditors of the old company. But mere purchase of a part of a coal company's property, after injury had been sustained by one of its employees, did not subject the purchaser to liability for that injury, the selling company having retained sufficient property to discharge all of its liabilities. (Kentucky Court of Appeals, Clouse vs. Carter Coal Co., 173 Southwestern Reporter 794.)

Extracts from a Superintendent's Diary

This morning I went on a little tour of inspection inside one of the drifts, and after I had finished and was on my way back to my office, still clad in my mining clothes, I had an adventure with a book agent.

He all but collided with me just as I passed Tim Tenney's house. Apparently Tim's wife hadn't given him a very cordial interview; at any rate he seemed pretty much worked up about something and was so busy trying to get his bearings that he was out of her yard and onto the sidewalk before he realized it.

I had neglected to blow out my carbide light on coming into daylight, and the book agent came so near to me that he singed one of his eye-brows on the flame. He managed to get his thoughts together pretty quickly after that.

I extinguished the flame and begged his pardon. He accepted it very graciously, and accomplished something else at the same time—he backed me up against a corner of the fence and started off on his set speech before I realized just what he was up to. It was all done so cleverly that I stared at him in evident admiration. He read my thoughts and waxed enthusiastic.

Then he began to address me as Mr. Coal Digger, so my sense of humor got the better of me and I urged him on out of sheer deviltry. I enjoyed every minute of the experience, even the grand finale when he turned over to the ruled pages in the back of his prospectus and insisted that I sign my name on a certain line.

The title of his book was "Getting on in the World," and again and again while enlarging upon its merits he assured me that it contained all the necessary information to show me how to get above being a common coal digger. He thought that I would have no trouble climbing up to a position in the commissary, and he felt sure I might in time even get an assistant superintendent's job.

I told him all that sounded very well, but I couldn't read or write.

"That don't make any difference," he ventured; "get your wife to read it to you."

"Was that what you suggested to Mrs. Tenney just before I came along?" I asked.

He had to grin in spite of himself. "I sure did, young fellow," he said, "but if I had known what kind of a woman she was, I wouldn't have done it. After I realized my mistake I tried to patch things up for her old man because I sure felt sorry for him, but little did I accomplish. It looked for a time as if I'd have to call on some of the neighbors for protection. I hope her man don't come out of the mine until she has had a chance to cool down some."

Then I changed tactics suddenly and asked him why he didn't absorb a little of the "sure rules for success" himself and capture a job with a fat salary attached.

To which he replied: "Don't get fresh, son, just because I've taken an interest in you. When you work up to my stratum in society, come around and I'll give you some further advice; but in the meantime just attach your signature to the prospectus and sleep with the book when it comes. Just to put you right, though, take it from me that you won't get far unless you learn to respect your superiors."

The Labor Situation

SYNOPSIS—Union anthracite miners are seeking 71,000 new members. Gilday accepts state position. Strike has permanently injured Ohio.

In the anthracite region the canvass of the union for members seems likely to prove as exciting as a political campaign and will be conducted with all the aids which are used by politicians in making an appeal to the electorate. The stores in many places will be closed and the clerks will join the procession. Bands will play and a string of automobiles will be in line. This demonstration will serve not only to initiate the campaign, but to act as a notable recognition of the dignity of mine labor.

The membership of the three anthracite districts is said to amount to somewhat over 100,000 men. The report of the Department of Mines for 1913 shows 175,310 men employed in and around the anthracite mines, but of these 424 are inside foremen, 1086 are their assistants, 778 are firebosses and their assistants, 121 are superintendents, 419 are outside foremen and 841 are bookkeepers and clerks. Some of these men might join the union, and to balance them some of the other men not belonging to the specific categories mentioned might be unlikely to affiliate owing to official position. Consequently the total—3669 men—might be deducted from the aggregate working force of the anthracite region to obtain the number of men who might be expected to be union members. Roughly, then, there are 71,000 men, or 42 per cent. of the whole available working force, whose affiliation is to be sought.

This appears a large number, and in some parts of the region there must be large bodies of men ununionized; for in others the 100-per cent. union has been secured. However, it must not be supposed that the union is disintegrating, for in 1912 the membership was not nearly so general. It was then only about 30,000, while in 1910 it was little more than 15,000.

Pat Gilday Becomes Chief of Bureau of Mediation

Patrick Gilday, of Morrisdale Mines, Penn., who was formerly president of District No. 2, which covers central Pennsylvania, and who was succeeded at the last general union election by James Purcell, of Wellsboro, Penn., has been appointed by John Price Jackson, who is State Commissioner of Labor and Industry, as chief of the Bureau of Mediation and Arbitration for the state of Pennsylvania, with a salary of $3500 a year.

Mr. Gilday has been recently a part of the conciliation board of the United States Department of Labor. A worse choice than Patrick Gilday could well have been made. He is by no means an irreconcilable. He believes in the miners keeping their contracts and at a recent convention urged that both operators and miners be kept in line by the assessment of fines for violation of agreements. He is a warm advocate of education and believes the miners should help worthy applicants through State College.

In the Kanawha district, where he acted as conciliator with Charles W. Mills and A. L. Faulkner, for the United States Department of Labor, the commissioners showed no great amount of strength of mind, presenting as they did alternative bases for settlement. In the provision of one of these the check-off, which is generally regarded as illegal, was included. It was thought that Federal mediators would hardly recommend an arrangement which was at least of doubtful legality. It had been hoped that the report, by omitting this provision entirely, would tacitly condemn any such provision. However it left the question open by including it in one of the alternatives; and it must be admitted that the temporizing policy succeeded and one of the plans suggested was speedily accepted, and the strike was soon at an end. The operators thus conceded practically everything to the miners, including the bitterly opposed check-off.

Strike Is Permanently Injuring Ohio

Last week we recorded the fact that the Sunday Creek Co. had announced its withdrawal from the Hocking Valley coal field. This withdrawal, while said not to be permanent, will continue until conditions become such that the field can be operated at a profit. This marks the final closing of 10 mines in what is known as the Hocking Valley Ry. side of the valley. In many cases the stocks in the company stores have been moved to the West Virginia field, denoting a complete abandonment of these commissaries for the present.

On the Toledo & Ohio Central Ry. side of the valley the Sunday Creek Co. is still operating three mines. These are No. 254 at Jacksonville, No. 301 at Congo and No. 266. In addition the company is still operating one of the San Toy mines, located on the Baltimore & Ohio R.R. It is doubtful if even these mines will be operated for any length of time unless conditions in coal circles become better. It is generally believed that the mines will be closed in two or three weeks.

The company is devoting its operations largely to the West Virginia field, where labor troubles are not so frequent and where freight rates are more favorable. The property of the company in that field, which has been partially neglected for some time, is being put in shape for a large output. John H. Winder, general manager of the company, in speaking of the company's action, said: "These mines go down and they go down to stay until something is done for relief. We are not justified in operating these mines under present conditions."

Like many other Ohio corporations, the Maynard Coal Co., of Columbus, Ohio, having mines at Rutland, Meigs County, Ohio, near the Pomeroy Bend, is looking in an outside state for an opportunity for development and will establish a model operation in Perry County, Kentucky.

It is claimed that with the present discriminatory freight rates, the Ohio fields are unable to compete with the West Virginia, Kentucky and even with the Tennessee fields, where coal can be produced so cheaply that it can be placed in the Ohio market for even less money than Ohio coal costs to produce. The unfavorable legislation on the part of the Ohio General Assembly and its passage of the anti-screen law is also given as one of the causes for withdrawing from the state. The Sunday Creek Co. also declares that the prolonged strike in the Ohio fields has permitted the producers from West Virginia and Kentucky to invade, capture and keep the markets formerly held by Ohio coal.

Future of the American Mine Safety Association

The secretary, H. M. Wilson, of the American Mine Safety Association, under the instructions of the executive committee has presented to the members a choice of one of three courses. These are: To merge the association with the National Safety Council, to continue as a separate association with increased dues or to disband the association. The last plan is not easy, as the society is in debt.

The National Safety Council has a membership of 1300, with 3500 representatives—some members having more than one representative in the organization. The American Mine Safety Association is small in comparison with the body with which union is proposed, having only 44 associate members and 162 active members. The larger society is interested in safety, not only in mining, but in manufacture, railways, street cars, public places, in the insurance of employees and in other fields.

It has an assured income of approximately $25,000, and this is increasing. The American Mine Safety Association has an income of $1700. As a result while the mine society can pay its officers no salary whatever and is accumulating a perplexing debt, the National Safety Council is able to maintain a competent and well-paid secretarial and clerical office force at its Chicago headquarters. Its safety circulars are issued weekly instead of monthly, and it has 17 strong local branches in cities from Boston to San Francisco which are holding monthly meetings or rallies.

The Railway Safety Association has recently been merged as the Railway Section of the National Safety Council. Similarly the American Mine Safety Association is invited to affiliate itself as a Mining Section. The dues for 1915 will be unchanged, but after Jan. 1, 1916, membership will be renewed in the National Safety Council on its regular schedule of dues, which is $1 for service members and $5 for active members. The industrial members, corresponding to the associate members of the American Mine Safety Association, will pay $10 for 100 employees, $15 for 250, $25 for 1000 and $100 for 10,000. Each $5 of such dues paid will entitle a member to one additional representative and one set of service literature.

What Costs Little Is Little Valued

The American Mine Safety Association made the mistake of setting its dues too low, like many other societies. It was evaluated exactly at its own valuation. The fear to put institutional dues too low is always a grievous mistake. A business-man looks with suspicion on an association which demands $10 a year and will even let him in at $3, but which nevertheless assures him that it is doing a work worth twenty or more times the expenditure requested. He feels about the proposition as a man does who is offered a new hoist at one-third the recognized price. The appeal for a mere dole is met with suspicion, and it is likely that after the year is out he will not renew his subscription.

The safety movement is worth a great deal to miner and operator. The association has done much to fill the need of the hour. It would have done more had it been launched as boldly as the National Safety Council.

Many Persons Wanted a Larger Field Covered

There has been a feeling in Alabama that the American Mine Safety Association did not completely cover the field. It was argued in reply that to cover too large a field was to weaken its value, but Alabama operators persisted in their belief that the safety society which they favored should cover work at furnaces, in sawmills and factories and so they organized the Alabama Safety Association. There is evidence of other like secessions and duplications, and consequently the larger appeal of the National Safety Council is receiving careful consideration.

The Executive Committee, under art. 6 sec. 2 of the constitution, has called a meeting to convene in the offices of the secretary, at Sewickley, Penn., July 15, 1915. Voting will be by letter ballot.

COMING MEETINGS

The Order Kokoal will hold its annual pow-wow at Chicago, Ill., July 13 and 14, 1915.

Northwestern Retail Coal Dealers' Association will hold its annual meeting July 15-16, 1915, at Minneapolis, Minn. Secretary, H. L. Laird, Minneapolis, Minn.

The Southern Appalachian Coal Operators' Association will hold its semiannual meeting July 23, 1915, at Knoxville, Tenn. J. T. McCoy, Knoxville, Tenn., is secretary.

The American Mine Safety Association will hold a meeting July 23-24, at Billings, Mont. Secretary, H. M. Wilson, 40th and Butler St., Pittsburgh, Penn.

The United First-Aid Corps of the 4th district, Delaware, Lackawanna & Western R.R. Co.'s coal department, will hold its third annual first-aid contest at Harveys Lake, Penn., on Aug. 14, 1915. Secretary, Lewis Richards, 212 East Green St., Nanticoke, Penn.

The Somerset County Miners' First-Aid Meet will be held at Boswell, Penn., Sept. 4. The names of the local committee follow: F. W. Cunningham, Somerset, Penn.; Samuel Steinbach, Somerset; Richard Maize, Jerome; John Gibson, Jr., Boswell; Ralph Zimmerman, Ralphton.

The American Mining Congress will hold its 18th annual session at the Exposition Memorial Auditorium, San Francisco, Calif., Sept. 20-22, 1915. J. F. Callbreath, secretary, Majestic Bldg., Denver, Colo.

Editorials

Why Are Coal Strikes of Such Frequent Occurrence?

Under this caption is discussed in this issue some of the causes which appear to one investigator to lead to discontent and strikes. He believes that the inequality in earnings around the mines is a constant source of irritation and that many men, frequently from no cause over which they have control, are earning less than a living wage, even where the mines at which they work run with reasonable steadiness.

With this argument it is necessary to differ. It is certainly not true of union mines, where most of the strikes occur. There are probably no mines operating under a scale in which the requirement is not made that the turn must be equalized. To ascertain this fact, reference has been carefully made to the eastern Ohio, Coshocton, Kanawha, Terre Haute, Des Moines, Wyoming, Du Bois and Pittsburgh agreements.

The clauses relating to the car turn in these contracts are not precisely similar. In some the turn must be squared every month, in others every week or every day. In some the turn must be proportioned for pick miners and machine loaders according to the wage rate per ton so that both can earn the same wage. The Ohio agreements, as far as investigated, require specifically that no free turns be given in room or entry. The Pittsburgh agreement is more elastic and says: "An equal turn shall be kept as far as practicable. This must not interfere with development or necessary work."

It is clear, then, that the equal turn is quite generally established in those mines which are frequently the scenes of strikes, and it is also true that the rule is always kept in a manner satisfactory to the union. That is, at the end of the period stipulated or even more often the miners are allowed to equalize the turn as set forth on the weigh sheets. Those who have had a shortage of cars are given a balancing excess if they so desire.

But the equal-turn rule is by no means as just as might at first appear, especially as it is administered. In Ohio it appears in an extremely crude fashion which declares openly for equality. In Indiana it is somewhat fairer and simply states that every miner shall be given an equal opportunity to load an equal turn. This makes it possible to refuse to give a man cars who has lost his right to them by leaving the mine early or by refusing to load them when offered.

Anyone who has been in a drift mine knows how often men leave early or arrive late and how frequently they refuse cars because they are not prepared to load them. Quite often the miner has a valid reason for refusing cars and the matter cannot be determined by the driver or the foreman. So in the long run the rule is to determine the right to cars by the weigh sheet. Thus the men who would work are held back so that the men who have not worked may receive the cars which they have previously refused. The equal turn is often unfair for this reason and reduces the output of the men.

But there is another inequality in the equal turn, and this acts directly, not only to reduce the average wage, but to create inequalities in earnings. A man who has an abnormal place, such as a heading, room neck or crosscut, a place with dirty coal, a room where the top or bottom must be ripped or a chamber with a bottom coal which lifts with difficulty gets pay for the disadvantages under which he works. He also gets the equal turn.

Consequently he gets more pay than the man with the absolutely normal place to whom is given only the regular tale of cars. He could load more and should do so as the conditions are favorable, but the inexorable law is equality of cars even where the result is far from an equality of earnings.

It is true, of course, that the inequalities are in themselves often quite fair. The entry driver should be better compensated than the miner, for he is usually a more skillful workman. But in other cases the rule works the other way, and the man drawing pillars, who is risking his life in a place not the safest, and who is a clever workman or he would not be trusted in such place, is paid no more for his services than the man who has just come to America and who consequently has been given the safest place imaginable where he is least likely to do any damage to himself or anyone else.

The equal turn with all its inequalities is a good provision and swept away many undoubted abuses of which the drivers and even the foremen were often guilty. Consequently the union cannot be blamed for enforcing it. The operator also has little cause to condemn it, because it puts a premium on work in undesirable parts of the mine and makes it easy to get them manned. If the work in difficult places was not a pure gain over and above what could be earned by filling the equal tale of cars—a sort of tip as payment for undesirable conditions—the operator would have to pay heavily for such work.

But this is not the only fault that can be found with the attitude of the writer of the article under consideration, for a protest should also be raised against an assumption too often made recently that because a loader could shovel 20 tons in a day such an output should be expected as an average from end to end of the country. There are places with low coal, where bottom has to be lifted, where shoveling is difficult or where double-shoveling is necessary. In others draw-slate falls and in still others the lifting of bottom coal takes time. In most cases the loaders have to drill their coal, load the holes and shoot them, and in all cases timber the roof and lay track. Furthermore if there was a driver at hand at all times there would be some loss of time at every exchange of empty for loaded cars.

The efficiency experts are faced with a difficult situation. Their work, owing to the operation of piece-work payments, is largely limited to transportation, powerhouse and dumping problems and in bituminous workings does not cover over 20 per cent. of the whole cost of mining. It is true that with more bosses the whole mining operation might be more efficiently handled, but as the operator is not the party most at interest he is unwilling to cure the situation by decreasing his meager profits or increasing his losses, as the case may be.

It is doubtful in most cases whether he could save the cost of the additional bosses by the savings they would insure. More supervision often means more friction. In some cases this appears between bosses and men, and in other cases between the foremen employed. It is not infrequent to find the inside and outside mine foremen in ill-disguised antagonism.

But the efficiency expert is confronted with another difficulty. If he succeeds in getting more cars to the working faces he may find himself face to face with the prospect of a short day. He will find that the miners will all be at the baseball game in the afternoon when the drivers are trying to secure a trip. This is quite a frequent trouble, and one reason for the slow run of the drivers is frequently the fear that the boss will declare the run at an end after only six or seven hours. The gain of the miner thus injures the company man.

In short we can see scarcely any hope for improvement except in *motive*. If the workmen can be made to seek thrift, to recognize that productivity is a duty owed to the people at large, to realize their parts as cogs in the industrial wheel and understand that the machine will run ill if they do not interpose at the exact moment when their work is in demand, then we can get results. The duty of the operator to sell cheap coal is preached from the housetops; the obligation of the miner is not less obvious. There is no reason why he should not know that he is a citizen with obligations.

The hope of any industry is in the character of its men. If they are anxious to work, have a strong coöperative sense, use judgment and inventiveness, there is hope for success. But if they seek to do a minimum and if they find opportunities to block progress, no solution can be found for the evils from which the industry suffers, especially when men are paid by the piece. Of course there always remains the possibility that gang work may be introduced into mining. Then supervision will be easier and cheaper and personal responsibility may be felt in mining as it is in other industries which are closely supervised.

⁂

Men and Machines

Every part of a machine is designed for a certain purpose. The purchaser is convinced that every unit in the design is placed in the machine to perform some definite work. If it does not do it, then the purchaser carefully tries to find out why, and if he finds or thinks he finds that something is wrong in design or assembling, he rights it or tries to do so. It is the recognized way in 1915. He knows no other, unless it be to telephone the manufacturer.

But it used not to be so—when a man bought a machine he believed that it was impossible that he could remedy its failings. He flung it away and rained imprecations on it as children will deal with a watch which won't run. That was many years ago, and somehow the idea has spread since then that a man who can't run a machine he has bought is a fit victim for raillery. That can be readily noted when a man is tinkering on his automobile or bicycle and cannot make it work. He is the sport of all those who can handle their machines successfully and more especially of those whose misfortune or luck it has been never to own a machine.

But the operator or manufacturer takes no such view of the human element in his machinery. He immediately condemns the shortcomings of the man who gives him trouble without scheming a way of preventing them. It has not yet come to the time when the discontent and strikes and incompetence of the employees are regarded as evidences of poor management. To an extent, that is what they are. They show that something has been wrongly handled and are evidence of our failure to control matters or there would be no "knock" in the operation of our engine.

The art of handling men, or of helping them to handle themselves, is the great art of management. The clever change in assembling which gives the most efficient use of steam in a cylinder is not more subtle than the tact which makes a mine work without friction.

The boy, Alexander Potter, who attached the valves to the walking beam so that he would not have to open them himself at every stroke of Watt's engine is a fit model for the manager, who should never try to create a machine in which he himself is an integral part, but one which will work well while he is not there and one which is so fittingly put together that it will control itself. He, like the boy, must build himself *out* of the machine.

A contrivance which will work without watching is the aim of the manufacturer. Such automaticity should be the object of the mine manager, and it can only be reached if he somehow succeeds in getting men of character or creating them from indifferent material. The work of a mine manager is to select and train men—not assistant managers and foremen only, but miners.

We have only just begun the work of training. We are at the early period of evolution; we have learned how to cast off and to imprecate our laboring men. But when are we really going to learn to adapt our labor as we would adapt a machine to our needs and ideals? When are we even going to assemble it according to the best principles and give every man the work which suits his mental makeup?

When at last we conclude that we are even more responsible for the organization we build up than for the machinery we buy, then will be completed that great work the starting of which characterizes the early part of the Twentieth Century. For want of a better term, this innovation is dubbed welfare work, which, being interpreted, is the art of preparing men for their duties.

⁂

New Form of Coal Storage

It has been suggested that the mines which are operated by steam shovels can keep steadily at work regardless of the demand for coal by utilizing the dull months of the year—when there is no demand for domestic fuel—in partially stripping the cover from the coal, the operation of mining being completed with great rapidity as soon as the demand for coal makes the mining of it desirable.

In this way the coal does not in any way deteriorate. It is true that the stripping is made a little more difficult as it is harder to find a place for the material removed. Like all stocking at the mines, it is not desirable for the railroad. Transportation companies with limited equipment are not pleased to see facilities for meeting such demands, as it assures them of a large tonnage in the seasons when they are least able to handle it.

Discussion By Readers

Value of Coal Analyses

Letter No. 2—The inquiry of N. G. Near, Coal Age, June 19, p. 1072, is one that many others interested in the coal industry have no doubt asked themselves many times. In entering upon this discussion I will state my viewpoint, which is that of a coal analyst who performs the tests and who is in a measure responsible for the correct interpretation of the results he obtains.

The uninformed coal-buying public do not seem to realize that the testing of their fuel should be done regularly, systematically and efficiently, not so much to find out that they are being imposed upon, but rather to show that they are imposing upon themselves. The value of coal analyses is such a vital question and of such growing importance that it is well worthy of a comprehensive discussion by mine operators, coal purveyors and consumers and the industry at large. The great practical importance of a coal analysis is in the control it exerts on the operations using this kind of fuel. Think of the constant repetition of analyses and routine chemical work done to determine the value of the output of metal and ore in steel and cement mills and metal mines. How long would these run nowadays without the guidance of the daily analyses of their materials and products?

The calorific determination of a fuel is a boiler-room necessity in plants using mechanical stokers and other modern combustion appliances. A slight variation in the composition of the coal would cause irregularities that in turn affect the entire plant. The cost of the analyses may at first seem high, but when carefully considered and apportioned among the different departments it is almost negligible in comparison with the benefit derived by so doing. In my own experience I have known times when an advance analysis of the fuel was a decided necessity and averted considerable worry and inconvenience, to say nothing of the loss of time in the operating schedule.

For the benefit of smaller consumers I would propose that it should be the office of the coal-sales agency to furnish analyses of all shipments of, say, 100 tons and over. A sales agency has the handling of perhaps several brands of coal from as many different districts, and it would be better to concentrate the analytical work in one well-equipped coal-testing laboratory, capable of taking care of a lot of combined work, instead of having a multitude of small and inefficient testing laboratories. To impose this duty of testing coal on the mine operator, as suggested by Mr. Near, is hardly just unless his commodity can be sold at an increased price. The operator's endeavors are centered on bringing the coal to the tipple in as good form and as uniform as his seam of coal and operating conditions will permit. It should be the duty of the sales agency to exploit the quality of the coals it offers on the market, substantiating the claims by reliable analyses.

It is possible to show how fuel can be saved by securing greater efficiency in power plants only by knowing the purity and character of the coal. The evaporation or boiler test indicating a lack of efficiency in any given plant is of no value unless we know the calorific value of the coal used in the test. Accordingly if we wish to know the daily efficiency of a boiler-room equipment we must have the daily routine laboratory tests. If we wish to be thorough and scientific in the conversion of the energy of coal into power, we must pay for it. In the study of engine-room chemistry we must first become thoroughly acquainted with the composition and properties of the coal, and this can only be ascertained by analyses.

Longwall vs. Room-and-Pillar Mining

Letter No. 1—I have read with interest the articles on longwall mining that have recently appeared in Coal Age. None of these letters, however, has gone far enough to indicate the advantage of this system of mining over the room-and-pillar systetm.

The discussion in Coal Age has aroused a controversy here between the adherents of these two systems of mining. The room-and-pillar advocates claim that their system can be safely adopted under all conditions, while the longwall plan is limited and confined to localities that have a hard roof and bottom and cannot therefore be safely adopted anywhere and everywhere.

If these claims be true, it must be acknowledged that there is little encouragement to experiment with the longwall system of mining, which must hold out at least a promise of decided advantages over the other systems in order to make such experiments worth while and of interest to mining men.

The longwall advocates, on the other hand, claim that the average cost of coal production in Iowa and Missouri, by the room-and-pillar system of mining, is $1.40 per ton and that 60 per cent. of lump coal is produced, the remaining 40 per cent. of the output being screenings. They contrast this cost of production under the room-and-pillar system with a cost of from $1.20 to $1.25 per ton under the longwall system of mining in the same states, which they say yields 90 per cent. of lump coal.

As a result of this controversy a little dinner is at stake, and it has been decided to submit the question to Coal Age for its decision as to who shall pay for the dinner. The question to be decided is, Has the longwall system the indicated advantage over the room-and-pillar system of mining, assuming that the physical conditions in the seam will admit of the adoption of the former method.

Fred Morck.

Tuscaloosa, Ala.

[In response to the above request, we would suggest that it would be manifestly unfair for Coal Age, not having heard the arguments presented, to decide the question, as to who shall pay for the dinner. We would suggest that the advocates of both of these systems of mining present their arguments for discussion in Coal Age. Such a discussion would be of great interest to all readers and would probably be a greater benefit to the advocates of both systems than the proposed dinner. It may be stated with assurance, however, that where the conditions are favorable, longwall work properly conducted will fully justify the claims here presented.—Editor.]

⁂

Stopping Payroll Leaks

Letter No. 5—Some very interesting points were brought out by H.R.K., in Letter No. 4, Coal Age, June 5, p. 990. The conditions named in that letter are very close to those under which we are working at the present time in our mines. We are recovering ribs and stumps that have been standing from two to six years. The work entails much expense that could have been saved had it been done at the proper time.

I want to mention another source of expense that can often be avoided by a little foresight and judgment on the part of the foreman. It often happens that the roof slate in a mine is weak and troublesome in spots. When this is the case, the usual practice or custom is to timber the entry through such places. This is done as a matter of course, without giving a thought to the question of the relative cost of timbering such a stretch of roadway and that of taking down the loose top and removing from the mine what is not needed for building the stoppings in the crosscuts. When the roof slate is overlaid with a hard rock or shale, it will generally be found much cheaper to take it down than to secure it with timber.

In my experience I have often asked myself the question, Does it pay to timber such places? and I have invariably come to the conclusion that it does not. In most cases it will be found that the cost of securing such dangerous spots in an entry by suitable timbering would more than pay for removing the loose material, and in addition there would be secured a permanent good roof, while the expense of renewing timber from time to time as required would be avoided.

It often happens that it is impracticable to take down such bad roof in an entry, as for example under shallow covering or where the roof slate is overlaid with soft material that would "cut." These cases, however, are comparatively few in many coal-mining districts. In the mine where I am at present employed the roof conditions are generally good, but soft spots occur at different points. There is the ordinary drawslate with from 8 to 10 in. of roof coal, above which is a black slate resembling a soft soapstone and varying from 1 to 8 ft. in thickness. It is this stratum that causes the trouble when it becomes soft or tender as it does in places.

A short time ago I had occasion to handle one of these soft spots in a butt entry where the roof had been timbered five years before. The work on this entry was being drawn back, and the entry pillars and stumps had been removed to within 300 ft. of the main-entry pillar. At this point the roof between the main entry and the first room became dangerous, and it was necessary to remove the entire loose material by placing a stick of carbonite on the end of a timber set. The shot blew out seven sets of 10x10 timber, and from 30 to 35 tons of slate came down. To remove this material required the work of two men for 17 hr., making a total of 34 hr. at 32.5c. per hr., costing $11.05. This did not include the cost of haulage and dumping the material, which was a matter of little moment in this case as the facilities for handling the dirt were excellent.

Compare this with the original cost of timbering this place. Each set of timber consisted of two 7-ft. legs and one 8-ft. cap of heavy 10x10-in. sticks . These were oak-lagged with old props reinforced with four 40-lb. steel rails. It may be estimated that the work of setting these timbers would require seven days for two men at $2.60 per day, making a total of 14 × 2.60 = $36.40. To this must be added the cost of the timber, say $3 per set, or $21 making the total cost $57.40. If this material had been removed at the start, the expense of removal would have been $11.05, as given; but owing to its having been timbered and later removed, the total expense was the cost of the timbering and its later removal. In other words, the cost of the timbering and the material used ($57.40) would have been saved by a little foresight or judgment.

In the development of a mine it will often happen that there are met a number of such places where the same saving of expense, or even a larger amount, can be effected by removing the loose material at once instead of attempting to secure these places with timber. Where timber is used, it must be remembered that it will be necessary to replace much of it before the road is abandoned. The work of retimbering a road will often exceed the original cost of setting the first timbers, as in many cases heavier timbers will be required.

⁂

Rail vs. Water Freights to Pacific Coast

Referring to the inquiry of H. C. Marchant, sales manager for the Lion Coal Co., which raises some interesting questions, I would offer the following suggestions:

Competition of Wyoming and Utah coals for the North Pacific coast trade involves other questions than the mere cost of shipping and delivering of coal from the Atlantic States to the Pacific Coast. The points necessary to be considered may be summed up as follows:

1. The tonnage involved, depending on the consumption of coal in the U. S. Pacific coast markets. 2. The coals competing for this trade, their source, quality, availability and cost. 3. The cost of each coal at points of consumption. 4. The method and cost of handling, discharge and delivery from ship or cars. 5. The competition of other fuels with coal.

On these various points, I offer the following as the best information available at the present time:

1. Government reports, trade statistics and other like sources give an approximate idea of the consumption of coal along the United States Pacific Coast, at least as far as covering the most important markets. This information may be summarized as follows:

San Francisco—The receipts of coal, in 1914, totaled 373,095 tons, derived from the following sources:

Foreign countries: British Columbia, 97,598 tons; Australia, 123,050 tons; Japan, 25,077 tons; Great Britain, 13,421 tons; China, 1000 tons.

Home supply: Washington, 12,637 tons; Oregon, 73 tons; East, by rail and water, 100,239 tons.

This shows a total of 260,146 tons, or 69.7 per cent. of the total coal consumption as coming from abroad, while only 112,949 tons is supplied by home operations, and 60,000 tons of the last item was used by the United States Navy.

The coal consumption of San Francisco has steadily decreased from 593,164 tons in 1911. This decline began in 1900 when the consumption was nearly two million tons.

Portland—The coal consumption of Portland amounts to about 100,000 tons per year, the coal coming mostly from Washington, Wyoming, Utah and British Columbia. Wood and oil are strong competitors for fuel in this market.

Seattle—The receipts of coal by water at Seattle, during 1914, amounted to 45,113 tons from British Columbia, 473 tons from Alaska, and 4730 tons from the Atlantic Coast. Oil is a strong and growing competitor here also.

Since the first of the year there have been a number of cargoes of coal shipped to the Pacific Coast, including two cargoes of anthracite; but most of this coal has been for the use of the navy, which is increasing its supplies of coal at the naval stations.

Whether the opening of the Panama Canal will enable Atlantic Coast coals to compete to any extent for the North Pacific markets is very doubtful, unless ocean freights are materially reduced.

It is likely that the imports of Australian coal will be considerably reduced during this year and this would afford an additional opportunity for the Wyoming and Utah coals to reach the Pacific Coast.

2. In an article published in Coal Age, Vol. 5, pp. 888 and 1003, entitled "Effect of Panama Canal on World's Coal Markets," I gave some analyses of competitive coals on the Pacific Coast, which may be used here:

	Moisture	Volatile	Fixed Carbon	Ash	Sulphur	B.t.u.
Australian	1.32	40.47	52.58	5.63	1.23	14188
Australian	2.01	36.01	58.27	8.71	0.47	13300
Japan, Chikuho	4.21	42.92	45.71	7.33	0.68	12965
Vancouver Islands	1.16	40.47	50.04	7.80	0.53	13410
Vancouver Islands	1.00	29.00	57.20	11.90	0.90	13010
British Columbia	....	26.30	64.70	9.00	0.50	13820
British Columbia (washed coal)	....	25.20	68.60	6.20	0.50	14310
Best New River	1.107	20.50	73.37	4.96	0.828	15033
Washington, Renton	.....	38.54	48.19	13.27	0.84	11911
Washington, Roslyn	.....	36.76	50.36	12.88	0.36	13056
Washington, Carbonado lump	.....	35.65	53.26	11.09	0.71	13480
Utah, Castlegate	.....	42.69	48.41	8.90	0.60	13014
Utah, Kenilworth	.....	42.70	52.32	4.98	0.33	13590
Utah, Winterquarters	.....	43.75	49.96	6.29	0.94	13237
Wyoming, Dietz	.....	40.91	52.58	6.51	0.97	12328
Wyoming, Monarch	.....	46.05	49.63	4.32	0.77	12559
Wyoming, Sheridan	.....	47.00	45.02	7.98	1.08	11599
Wyoming, Superior	.....	36.55	58.58	4.87	1.51	13250

The availability of any of these coals for the Pacific Coast trade depends wholly on the nature of the intended use. It must also be remembered that there is likely to be some anthracite shipped from the East and that there has always been a trade in smithing coals from the Atlantic seaboard, mostly in Georges Creek coal.

3. No data on freight rates from Wyoming and Utah points to the Pacific Coast are available. The present price of Eastern coals, New River and Pocahontas, for tidewater shipment is $2.85 per gross ton, f.o.b. Hampton Roads, although this price can be shaded probably, as the Navy Department has just closed a contract for Pocahontas coal at $2.60, f.o.b. tidewater, the rail freight from the mines being $1.40. Ocean freight rates from Atlantic Coast ports to North Pacific ports are very high now, as might be expectetd. Charters made during the last three months run from $6.46 to $7, while a year ago they were as low as $3.39 per ton.

4. No data are available regarding the relative cost of handling rail and water shipments at San Francisco or other Pacific ports.

5. The competition of oil as fuel has greatly reduced coal consumption on the Pacific Coast, so much so that practically the only market for coal is the domestic market and the foreign bunker trade, and even the latter has been considerably decreased of late years.

The United States Geological Survey estimated that at the close of 1913 the consumption of fuel oil in markets tributary to the Washington coal mines has displaced 5,000,000 tons of coal. It was also estimated that to perform the service rendered by California petroleum in the production of heat and power and in making gas it would require about 18,000,000 tons of coal.

In Western Oregon, generally, wood is the principal fuel for all purposes. At Portland oil is the fuel used for steam and gas making, wood being used for domestic heating. Good cordwood can be bought in this section as low as $3.75 per cord and slabs from the lumber mills at $2.25.

It is obvious from the above that the coal markets on our Pacific Coast are not large and will not be until oil production is materially decreased and its price for fuel increased. Under any circumstances, the Wyoming and Utah coals will find it difficult to compete with Australian and British Columbia coals, unless the exports of the two latter sources of supply are materially decreased by the present war or unless rail freights on the inland coals are cut down to a competitive point. The Vancouver coals for instance have but 940 statute miles of water transportation to San Francisco, while from Ogden to San Francisco is 786 miles by rail. In normal times the Vancouver coals sell for $6.90 trimmed in bunkers. The Australian coal, although coming from a great distance, is carried very cheaply.

I have no data as to freights between Australia and San Francisco, but Australian coal freights to Valparaiso, Chile, a distance of 6280 nautical miles, have been as low as $4.25 (1914), and the Chilean railways contract for 1915 was taken at $7.66 per metric ton for Australian coal. As the distance from Australia (Melbourne) to San Francisco is 6966 miles, it would seem that Australian coal can be sold there at about as low a price as in Chile.

As regards competition of Atlantic Coast coals, it is the writer's opinion that not much effort will be made by coal agencies in the East to enter the North Pacific markets, except for navy business. At the present ocean-freight rates, they cannot compete; and even when freights are low, they would have difficulty in competing with the British Columbia coals. Of course this does not apply to coals for special purposes, such as blacksmith and anthracite. The competition of Alaska coals in the Pacific markets outside of Alaska, about which so much was said a few years ago, need not be taken seriously and is not likely to amount to anything, owing to mining and transportation difficulties and costs.

F. R. Wadleigh.

Philadelphia, Penn.

Reducing Ventilation When Firing in Mines

Letter No. 2—Referring to Alexander McAllister's letter, Coal Age, June 19, p. 1070, on this subject, I would like to ask him to tell us how a current of air is to be forced into an entry "under pressure" when the entry is "open at both ends."

I have had considerable experience in fighting mine fires and working in all kinds of contaminated air in mines. I have never, however, observed such a phenomenon as Mr. McAllister describes—a column of pure air in the center of an entry and surrounded by afterdamp. I believe there are other factors that exert a greater influence on the distribution of the air in the sectional area of an entry than the friction against the roof, floor and ribs of the entry.

For example, if the temperature of the air in the mine is high as a result of a fire or local explosion, and the outside temperature is low owing to cold weather, the fresh cold air entering the mine will flow along the floor of the entry, until it gradually becomes warmer and mixes with the other air or forces it ahead. This is especially the case where the air current is not sufficiently strong to force the dead air of the entry ahead, as often happens in time of emergency.

But, again, on a warm summer day a small intake current of fresh warm air will generally be found to flow along the roof of the entry, and this will be particularly manifest where the air in a mine has been standing and is cool, and especially when the mine air is laden with carbon dioxide or blackdamp. I have frequently observed both of these conditions.

While admitting that reducing ventilation when firing in a mine will no doubt lessen the magnitude of an explosion should one occur, I cannot believe that such procedure will prevent an explosion from taking place when other conditions favor its occurrence. It is important to remember in this connection that, in a mine generating large volumes of firedamp, any reduction of the ventilation will allow enough explosive gas to accumulate in a brief time to cause an explosion when ignited by the flame of a blast.

My conclusion is, therefore, that the question of reducing ventilation at firing time must be determined by the condition of the mine in respect to firedamp. I may be pardoned for stating that, in my humble opinion, Mr. McAllister may yet have an explosion under the same conditions that he now claims render the mine immune from such an occurrence.

Edward H. Coxe.

Knoxville, Tenn.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

At each change of state in matter heat is either absorbed and becomes **latent in the mass,** or is given out and becomes **sensible,** causing a rise of temperature in the surrounding medium. **Heat is absorbed** when a solid becomes a liquid or a liquid becomes a gas ,the change being one in which the density of the mass is made less. On the other hand, **heat is given out** when a gas is condensed to a liquid or a liquid to a solid, the density of the mass being then increased.

Heat of Fusion—The change from a solid to a fluid state is described as **"liquefaction"** when solution takes place, or **"fusion"** if the solid is melted. The heat absorbed in the latter case is called "heat of fusion."

Liquefaction may take place as the result of the absorption of moisture from the air, the substance dissolving either wholly or in part in the water absorbed. Such a substance is said to be **"deliquescent."**

Solution takes place when a solid disappears in a liquid in which it is immersed. The solid is "dissolved" in the liquid, which is called the **"solvent."**

In any case of liquefaction or fusion heat is absorbed and becomes latent in the liquid, causing a seeming loss or **disappearance of heat.** When a solid is dissolved in a liquid the liquid is cooled provided no chemical reaction takes place, which might produce heat.

Heat of Vaporization—The formation of vapor or the change from a solid or liquid to a gaseous state is known as **"vaporization"** and the heat absorbed and rendered latent in the vapor is called "heat of vaporization" or frequently "heat of evaporation," especially when the vapor is formed by boiling the liquid.

Heat of Condensation—When a gas or vapor is condensed to a liquid or a liquid is frozen or condensed to a solid the latent heat of the gas, vapor or liquid is given out and appears as sensible heat, which causes a rise of temperature. The heat given out is called "heat of condensation" and is exactly equal to the heat of vaporization or the heat of fusion or liquefaction, as the case may be.

Total Heat in a Body—By this is meant the total heat absorbed by a body in a given change of temperature or state. For example, the total heat in 1 lb. of water, in passing from ice at 32 deg. F. to steam at 212 deg. F. is as follows:

Latent heat of fusion of ice, from and at 32° F.	144 B.t.u.
Sensible heat absorbed by water, 32° to 212° F.	180 B.t.u.
Latent heat of vaporization, from and at 212° F. ...	966 B.t.u.
Total heat absorbed	1290 B.t.u.

The total heat of steam at any temperature or pressure is usually estimated from water at 32 deg. F.; thus the total heat in steam (water vapor) at 212 deg. F. is 180 + 966 = 1146 B.t.u. This is the heat in steam at atmospheric pressure at sea level (14.7 lb. per sq.in.). When steam is generated in a boiler, its temperature increases with the pressure.

Inquiries of General Interest

Ventilation Problem

I desire to submit a problem in mine ventilation that has given us considerable anxiety in reference to the future development of the mine where I am employed. Our proposition is somewhat peculiar because of the fact that the property is only 1400 ft. wide, while the coal is thin, varying from 21 to 24 in. in thickness. The mine has been developed by driving a pair of main entries through the center of the property and turning cross-entries at right angles to the main entries every 300 ft. At the present time the first pair of cross-entries is at a distance of 4500 ft. from the shaft. We aim to keep 5 pairs of cross-entries open on each side of the main entry, making 10 pairs of cross-entries, each pair being 700 ft. long when driven to the boundary. The main entries are practically 6000 ft. long from the shaft to the face. All the entries are 5x6 ft. in section, giving a sectional area of 30 sq.ft.

In the ventilation of this mine it has been our custom to obstruct the main intake current at the mouth of each pair of cross-entries, so as to circulate from 3000 to 4000 cu.ft. per min. in each pair of these entries. Owing to the narrowness of the property and the thinness of the seam, it is impracticable to build overcasts and split the air current. For this reason the mine is ventilated by a single continuous current that passes through the main intake from the shaft to the face and returns through the main return air course to the upcast, a sufficient scale of air being taken off this main current for the ventilation of each pair of cross-entries, as previously mentioned. From this description it will be seen that the total length of the main current, including the return, is 12,000 ft., the sectional area 30 sq.ft., and the rubbing surface 264,000 sq.ft. The 10 pairs of cross-entries represent a total length of approximately 14,000 ft., with a sectional area of 30 sq.ft. and a rubbing surface of 308,000 sq.ft.

The present circulation of air is insufficient for the satisfactory ventilation of the workings, and I want to ask what the maximum quantity of air is that can be circulated on this plan under a 6-in. water gage; also, what you can advise as the best method of handling this proposition in order to get a circulation of 20,000 cu.ft. of air per min. in the mine.

Alexander Jeffrey.

Bay City, Mich.

In attempting to answer this question, it is well to estimate approximately what circulation of air will be produced by a 6-in. water gage under the plan described by the correspondent. Not knowing definitely the character of the mine in respect to the straightness of its airways, their condition and the amount of timber employed, we will use the modified Atkinson coefficient, $k = 0.00000002$, which will be safer under the circumstances than the Fairley coefficient, $k = 0.00000001$. We will assume a scale of 3600 cu.ft. per min. passing through each pair of cross-entries and returning directly to the main current. The total pressure absorbed by the circulation in the 10 pairs of cross-entries, on this basis, is

$$p = \frac{0.00000002 \times 308{,}000 \times 120^2}{30} = 2.95 \textit{ lb. per sq.ft.}$$

A 6-in. water gage corresponds to a pressure of 6 × 5.2 = 31.2 lb. per sq.ft. Hence, assuming a 6-in. water gage for the entire circulation in the mine, the pressure producing the circulation in the main entries is 31.2 — 2.95 = 28.25 lb. per sq.ft. The quantity of air this pressure will circulate in the main entries is

$$q = 30\sqrt{\frac{30 \times 28.25}{0.00000002 \times 264{,}000}}$$
$$= \textit{say } 12{,}000 \textit{ cu.ft. per min.}$$

The practical aspect of the problem would suggest, first, to clean up all airways, enlarge breakthroughs and straighten air courses and wherever possible shorten the distance of air travel by carrying the air through rooms that have holed into each other from adjacent pairs of cross-entries. Aside from these suggestions, however, if the quantity of air in circulation is still insufficient for the thorough ventilation of the mine, the best solution of the problem will be found in sinking an air shaft at or near the head of the main entries. This would make it possible to use both the main entries as intake air courses for their respective sides of the mine. In other words, it would then be possible to ventilate each side of the mine with a separate air split, coursing the air through consecutive pairs of cross-entries, as before, in each split. The pressure required to circulate 20,000 cu.ft. of air through the main entries from the downcast to the upcast shaft at the face, a distance of 6000 ft.—the total sectional area, or area of passage, being then 60 sq.ft. and the total perimeter, 44 ft., which makes the rubbing surface as before 6000 × 44 = 264,000 sq.ft.—is

$$p = \frac{0.00000002 \times 264{,}000 \times 20{,}000^2}{60^3} = 9.77 \textit{ lb. per sq.ft.}$$

For better ventilation of the cross-entries, we will now assume a velocity of the air current in these entries equal to 300 ft. per min., giving a scale of air of 300 × 30 = 9000 cu.ft. per min. in each pair of cross-entries. Since the air is traveling in two separate splits, it is only necessary to calculate the pressure for five cross-entries on one side of the mine, which have a sectional area of 30 sq.ft. and a rubbing surface of 154,000 sq.ft. Hence, the pressure absorbed in the circulation of 9000 cu.ft. per min. in each pair of cross-entries is

$$p = \frac{0.00000002 \times 154{,}000 \times 9000^2}{30^3} = 9.24 \textit{ lb. per sq.ft.}$$

The total pressure required in this circulation is therefore 9.77 + 9.24 = say 19 lb. per sq.ft., which corresponds to a water gage of 19 ÷ 5.2 = 3.6 in. In this calculation, we have disregarded the resistance of the shaft, which would have to be taken into account if of any considerable depth or limited in sectional area.

Examination Questions

Illinois Examination for Mine Managers, June 14, 1915

(*Selected Questions*)

Ques.—The hammer of a piledriver weighs 20 cwt. and reaches the pile with a velocity of 30 ft. per sec.; find the kinetic energy.

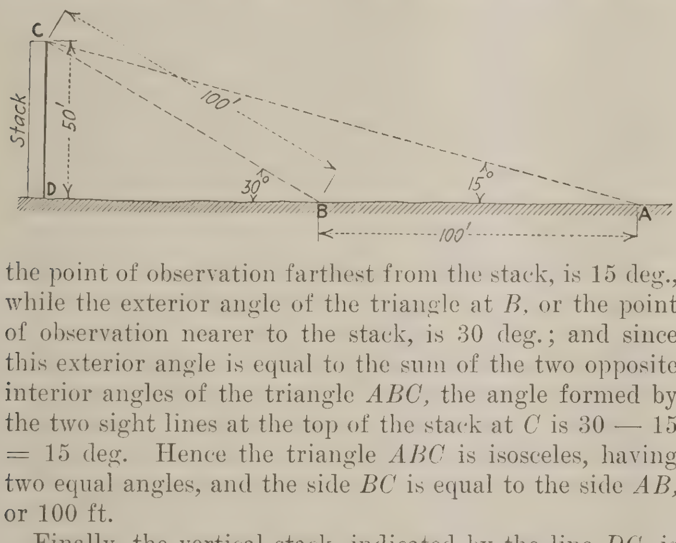
Ans.—The kinetic energy of a moving body is one-half the product of the mass of the body and the square of its velocity expressed in feet per second. The mass of a body is equal to its weight divided by the force of gravity expressed in feet per second. Taking the force of gravity as $g = 32.16$ ft. per sec., the kinetic energy is

$$\text{Kinetic energy} = \frac{2000 \times 30^2}{2 \times 32.16} = 27{,}985 \textit{ ft.-lb. per sec.}$$

Ques.—The angular height of a stack was found to be 15 deg., and at a point 100 ft. nearer it was observed to be 30 deg. What is its actual height?

Ans.—Assuming that these observations are taken from points having the same elevation, the line joining the two points of observation is the base of a triangle in which one side and all its angles are known.

Referring to the accompanying figure, the side *AB* of the triangle *ABC* is 100 ft. The interior angle *A,* being the point of observation farthest from the stack, is 15 deg., while the exterior angle of the triangle at *B,* or the point of observation nearer to the stack, is 30 deg.; and since this exterior angle is equal to the sum of the two opposite interior angles of the triangle *ABC,* the angle formed by the two sight lines at the top of the stack at *C* is 30 — 15 = 15 deg. Hence the triangle *ABC* is isosceles, having two equal angles, and the side *BC* is equal to the side *AB,* or 100 ft.



Finally, the vertical stack, indicated by the line *DC,* is the altitude of a right triangle whose hypotenuse is 100 ft. and the angle at the base 30 deg. The altitude of this triangle, or the height of the stack, is then one-half the hypotenuse, or 50 ft., since the sine of 30 deg. is 0.5, or one-half.

Ques.—What is the accepted theory as to the origin of coal? Assuming this theory to be correct, how do you account for the successive coal measures, one above the other, in this state?

Ans.—The generally accepted theory of the formation of coal is that the material constituting the coal measures was deposited on the surface in more or less level and consecutive layers. The material forming the coal beds was chiefly of vegetable origin, the result of successive seasons of vegetable growth and decay. Owing to internal or geological changes taking place in the earth's crust, there were successive risings and sinkings of the surface, which caused the successive inundation of different surface areas.

The deposits of vegetable matter were thus overflowed, and in this stage of the formation became covered with various other deposits of sand, limestone, clay and gravel or drift that often formed a conglomerate. The limestone was deposited from the calcareous matter carried in solution by the water that overflowed the area. These strata all contain fossils, which are the petrified remains of the bones of animals and different plants.

Other geological changes following caused the uprising of such flooded areas, which were again covered with a luxuriant vegetable growth that later deposited more coal-forming material. These successive geological changes made possible the successive deposition of the material forming the coal beds and the interstratified layers of rock, shale, sandstone, clay and conglomerate which form the coal measures. Other geological changes tilted the formations so that many of the beds are now inclined. The same changes exposed portions of the beds to erosion by surface streams and glaciers and caused many faults and displacements.

Ques.—What is the displacement or theoretical delivery in imperial gallons per minute of a three-ram pump, at a speed of 30 r.p.m., if the rams are 10 in. in diameter and have a stroke of 12 in.? If such a pump can empty a sump in 15 hr., after having been idle for 10 hr., what is the rate of inflow of water into the sump in imperial gallons per minute?

Ans.—The imperial gallon contains 277.274 cu.in., being larger than the U. S. standard or Winchester gallon, which is 231 cu.in. A pump having three plungers and running at a speed of 30 r.p.m. makes 3 × 30 = 90 strokes per min., assuming this style of pump is single-acting in its operation. The theoretical displacement is then $90\ (0.7854 \times 10^2)\ 12 \div 277.274 =$ *say 306 gal. per min.*

Assuming the sump was empty at the beginning of the 10 hours' idleness of the pump and that the latter could handle in 15 hours what ran into the sump in 10 hours, and allowing a slip of 15 per cent., or making the water-end efficiency of the pump 85 per cent. of the theoretical displacement, the inflow into the sump in imperial gallons is $306 \times 0.85 \times 15 \div 10 = 390+$ gal. per min.

Ques.—Given an arched airway, with semicircular arch 10 ft. in diameter, springing 5 ft. above the floor, and a velocity of air current equal to 500 ft. per min., what is the quantity of air passing in cubic feet per minute.

Ans.—The area of the rectangular portion of this cross-section is $5 \times 10 = 50$ sq.ft. To this must be added the area of the semicircle, which is $\frac{1}{2}\ (0.7854 \times 10^2) = 39.27$ sq.ft., making the total sectional area of the airway 89.27 sq.ft. If the average velocity of the air current is 500 ft. per min., the quantity of air passing in the airway is $500 \times 89.27 = 44{,}635$ cu.ft. per min.

Coal and Coke News

PENNSYLVANIA

Anthracite

Milton—Over $700,000 must be paid to the county and school districts in the county in tax money by the coal corporations having holdings therein. This money was held up pending the appeals from the tax revision boards increase of assessment, the subsequent appeals, and finally the supreme court. It is being paid in instalments. First $50,000 was paid, then $20,000, then $20,000 more, and so on. The school districts get most of the money while the county gets a small share.

Freeland—Claiming that the company failed to provide adequate safety appliances the Lehigh Valley Coal Co. has been made the defendant in a suit for $5000 brought by Mrs. Catherine Ferry of this place, to recover for the loss by death of her son, Daniel, in the Drifton mines of the company.

Wilkes-Barre—An action in assumpsit was recently started by Edward Fleming of Plymouth against the Kingston Coal Co., in which he attempts to recover $200 he claims for work done in the Gaylord mine of the company during February of 1892. He alleges to have blasted and loaded out about 200 tons of coal during the month before the "Gaylord disaster" occurred covering the place where the coal had been cut and loaded. He further alleges that in 1910 the coal prepared by him was recovered from the mine by the company and shipped to market; but that it has failed to pay him for the work he performed.

Scranton—One of the worst mine caves to occur in years took place recently in a territory that had been regarded as safe and free from underground workings. Every building in a considerable area on Jefferson and Adams avenues near Maple St. was badly damaged. One of the worst damaged buildings was that occupied by the 13th regiment armory where it was generally supposed that when the ground was acquired, the mineral rights went with it. There are now many fissures in the building about 3 in. in width while the entire structure was thrown out of plumb.

Production of anthracite during June fell below that of June, 1914, the majority of the collieries working only part time. Shipments of anthracite in June, 1914, amounted to 6,130,186 tons, but it is probable that for June, 1915, they will be about 400,000 tons less. The shortage for the first five months of 1915 was 536,401 tons, and it is thought that when the business for June is included, the deficit for the first half of 1915 will be nearly 1,000,000 tons less than the shipments over the same period of last year.

Pittston—A serious mine cave, west of the Taylor yards recently occurred which held up traffic for several hours and damaged a considerable portion of the double-track road bed of the Bloomsburg division of the Lackawanna R.R. This cave was discovered by yard men in time to send out warning. The cave occurred near the Old Forge and Taylor division line, and not far from the Forest Home cemetery.

The Pennsylvania Coal Co. recently posted notices informing the employees that thereafter no funds would be collected by the company for the relief fund which this firm has been carrying for many years. It is said that as soon as the surplus, which has been accumulated, is paid out to those members who have met with accidents in the mines, the fund will be abandoned. This move is probably the result of the passage of the compensation act by the recent legislature.

Almedia—Some of the coal dredges at work in the river at Almedia are being moved to Berwick where a bank of coal has been discovered in the river 3 ft. in thickness.

Hazleton—Kehoe & Co., mining contractor, who is in charge of the work of stripping a new operation for the Lehigh Valley Coal Co. at Scotch Valley, has been compelled to temporarily abandon the work. The 100 men employed by it went on a strike, alleging they had worked 9½ hr. a day and were only paid for a 9-hr. day.

D. J. Roderick, mine inspector in charge of the 11th anthracite district, who also acts as chairman of the examining board, has announced the result of the recent examination conducted by him for the position of foremen and assistant foremen. Fifty-one men participated in the examination and 37 passed. Of this number 11 qualified as foremen and 26 as assistant foremen.

Mahanoy City—Mine cave-ins at Yatesville recently so badly damaged the tracks of the Lehigh Valley R.R. that it was necessary to temporarily discontinue all railroad traffic and passengers were compelled to walk around the depressions to trains on the other side.

Bituminous

West Apollo—Fire supposed to have been caused by friction from the pulleys of the shaft at the Hick Coal Co. tipple near West Apollo, Westmoreland County, totally destroyed that building recently. There were 14 men working on the night shift and these were rescued with difficulty on account of the dense smoke. The fan house took fire and was consumed before the men emerged from the workings.

Connellsville—The Connellsville coke trade is increasing in volume. The production of the furnace ovens has risen to about 224,000 tons weekly, while the merchant production is 130,000 tons. The merchant operators are thus running at about 58 per cent. capacity while the furnace ovens are working at 74 per cent. Practically all of the independent coke operators in the Connellsville region have posted notices that the wage rate would be advanced to equal that of the H. C. Frick Coke Co. This rate is the highest ever paid, while there is a noticeable shortage of labor. Four hundred ovens have been ordered fired by the Frick company, while merchant ovens are being steadily added to the active list.

Evans Station—Between 25 and 30 coal miners went on strike recently at the plant of the Evans Coal & Coke Co. when their demand for a wage increase was refused. There was no trouble, however, and an amicable settlement was expected.

East Millsboro—One man was killed, four others were overcome by gas, and 42 had narrow escapes as the result of an explosion of gas in the Husted-Seaman mine on July 1. The one man killed, John Ward, was a pipe fitter, who was crushed under débris and suffocated by the after damp. The superintendent, fireboss, machine boss, and road boss were overcome by gas in an attempt to reach Ward. This mine employs about 150 men of whom 43 were in the pit when the explosion occurred. The fans were not injured by the force of the explosion and were immediately started operating at their full capacity. The cause of the explosion is not definitely known, but it is believed that a pocket of gas was ignited. No serious damage was done to the mine which will shortly be in operation again.

WEST VIRGINIA

Charleston—The deficit in the workmen's compensation fund now amounts to about $770,000. Operators have been paying the rate of $1 per $100 of pay roll. It is believed that for a time assessments against the operators must be placed at $2 for every $100 of payroll. This of course will be only temporary and would be graduated according to the amount of money which would have to be paid out by the commissioner. This rate is agreeable to most of the operators in the state, but those in districts where the death rate has been low object to such an assessment.

West Virginia has been redistricted for the inspection of mines, providing 15 districts instead of 12. This has been done in compliance with the new mining law passed by the last regular session of the Legislature. Three additional inspectors have been appointed.

Bluefield—The volume of coal shipments is still increasing, and from present indications it would appear that July will be another record month. It is said that never has the export trade been so great as now, recently Norfolk advanced to second place among the shipping ports of the country, it being said that this was largely due to the foreign coal shipments. Coal operators report that a new record will be established this month, probably the greatest in the history of the coal field.

Grafton—The Maryland Coal Co. is now operating its mines at Wendel full time and is hiring men to meet the demand for greatly increased business. The company is now loading from 90 to 100 cars of coal per day.

TENNESSEE

Knoxville—Southern Appalachian coal operators at a recent meeting here discussed exportation facilities, the preparations made for shipments via Charleston, S. C., etc. It was reported at the meeting that a South American country had sent an agent to the United States some time ago to buy 1,000,000 tons of coal but that he was unable to get it. Restricted traffic facilities, it is stated, shut the Appalachian operators out of this business.

KENTUCKY

Barbourville—Ground has already been broken for the Cumberland & Manchester R.R., the 24-mile line to be extended from Barbourville to Manchester, Clay County. The new line, when completed, will open up one of the most extensive, undeveloped coal and timber fields in the South.

OHIO

Columbus—A campaign is planned to educate Ohioans to "use Ohio coal.'" The first step will be scientific analyses to show that Ohio coal is superior to competing fuels from other states and will produce more heat units in proportion to the cost per ton. This activity in behalf of Ohio coal is the result of the shutting down of the mines of the Sunday Creek Coal Co., the largest operator in the Hocking district. Officers of this company are practically suspending operations in Ohio and will go to West Virginia, where they have valuable coal properties. They give as their reason that Ohio coal-carrying roads are discriminating in favor of West Virginia coal, and that it is practically impossible to compete, at a profit, with the West Virginia product.

A reorganization of the Ohio Mining Department, a part of the work of the Ohio Industrial Commission has been effected. On July 1, J. W. Davies, chief deputy mine inspector retired because of lack of appropriation to pay his salary. Mr. Davies was chief mine inspector under the Harmon administration and was succeeded by J. M. Roan with the title of chief mine inspector and safety superintendent. Mr. Roan has 12 deputies, who are used as field men.

Bethesda—The Badger Mining Co. has begun work at the mine north of the town. It will confine its work for the present to the Parsons tract recently purchased.

INDIANA

Bicknell—Robinson Bros., of Linton, who are sinking a shaft opening for a coal mine near Edwardsport, have reached the river vein. Later they will work a deep vein north of this mine.

OREGON

Toledo—The newly discovered coal mine here is operating daily with an output of 10 tons. This will be continued the balance of this year, and improvements put in for the next season's run to increase the output.

FOREIGN NEWS

Hillcrest, Alta.—The Hillcrest Collieries, Ltd., has been idle since the 15th of June, on account of British miners refusing to work until Germans and Austrians had been discharged. A conference just held between the operators and miners brought out that the company would permit the British and foes of that nation to work alternate weeks, if they would accept.

Juneau, Alaska—The local land office has received a decision of the commissioner of the general land office in the case of the Alaska Smokeless Coal Co.'s application for a group of claims in the Behring River district comprising some 1000 acres and known as the Feed group. The locators were natives of Norway and Sweden. Applications were rejected because the locators had not done the required development work. It is the hope of this office that all pending claims will be cleared up before the end of the year.

PERSONALS

Maury Robinson, the new manager of the Western sales office of the Davis Colliery Co., has taken up his duties succeeding J. W. Hood.

Morton McTurk, superintendent of the Hazle Mountain Coal Co.'s operations of the Black Ridge, has been promoted to the general managership of the McTurk Coal Co., of Girardville, Penn.

N. T. Roberts, Western sales agent of Williams & Peters, has been appointed a city grade-crossing commissioner of Buffalo, N. Y. The position is an important one and the commission has done much service, with much more to be done.

D. A. Thomas, the Welsh coal mine owner, who will represent the British Government in this country and Canada for the purchase of munitions of war, arrived in New York on the "St. Louis" on Monday, July 5. Mr. Thomas states he is here purely on Government business and will pay no attention to the coal industry.

C. L. Couch has been elected president of the F. P. Weaver Coal Co. of Buffalo and C. W. Moss, vice-president, secretary and treasurer. They are practically the sole owners of the stock, having bought the interest of President F. P. Weaver on his retiring some years ago, because of poor health. He died three months ago.

Frank S. White, president of Alabama Convict Improvement Association, has called a meeting of the state executive committee and county committees for July 13, the date of assembling of the legislature, for the purpose of working destruction to the convict lease system in Alabama, and having the convicts transferred from the coal mines to the highways.

George E. Silvester of Rockwood, Tenn., has been elected president of the Mine Inspectors' Institute of the United States of America. The other officers are as follows: Vice-presidents, Thomas Graham, L. D. Devore, Rees H. Beddow; secretary, J. W. Paul; assistant secretary, R. S. Wheatley; treasurer, R. T. Rhys, and editor-in-chief J. T. Beard.

OBITUARY

George W. Hines, a well-known coal miner and secretary of Local Union No. 786, United Mine Workers of America, died in Wheeling, W. Va., recently, following an illness of several weeks. Mr. Hines was 40 years of age and always took an active part in the affairs of the miners. He is survived by his widow and three children.

H. Sparks Bute, aged 70 years, dropped dead of heart failure in the office of Attorney J. M. Core, while attending a meeting of the Board of Directors of the Fink Creek Coal Co. of West Virginia. C. L. V. Bute and J. P. Bute of Uniontown, Penn., brothers of Mr. Bute, were present at the meeting. Mr. Bute was a bachelor and resided with his brother C. L. V. Bute.

John Zelenka, 35 years of age, Secretary of the Pittsburgh Vein Operators' Association of Ohio, with headquarters in Wheeling, died at his home in Brookside, Ohio, July 3, of diphtheria. His youngest daughter died the preceding day of scarlet fever. Interment was made at Linwood Cemetery. Mr. Zelenka entered the mines of Ohio at the age of 8 years, remaining there until the age of 24, when he was made president of District 5 of Ohio.

INDUSTRIAL NEWS

Moundsville, W. Va.—The headquarters of the Mound City Coal Co. have been removed from Pittsburgh to Moundsville.

New York, N. Y.—The Waterbury Co., manufacturers of manila, sisal and wire rope, has removed its general offices from 80 South St., New York City, to 63 Park Row.

Waukegan, Ill.—Extensive repairs and improvements are now being made at the Reiss coal docks which when completed will probably make this plant one of the largest on Lake Michigan.

Philadelphia, Penn.—The U. S. District Court in an opinion handed down July 3, denied the application of the Government to dissolve the alleged anthracite coal trust and decided the case in favor of the defendants.

Harrisburg, Penn.—According to figures issued by the Bureau of Mines the counties of Carbon, Lackawanna, Luzerne, Northumberland and Schuylkill in Pennsylvania mine the bulk of the world's anthracite—96 per cent.

Chicago, Ill.—Proposed increases in rates on coal over roads operating from the Illinois mines to Chicago and points in Wisconsin and North Dakota, were recently suspended by the Interstate Commerce Commission until Dec. 29 next.

Philadelphia, Penn.—During the past month the collieries of the Lehigh Valley Coal Co. were in operation 18 days, which is seven days less than the same period of 1914. The collieries will also be closed down during the first week of July.

Bellaire, Ohio—Announcement was recently made that the officers of the Pittsburgh-Belmont Coal Co., which has been located in Columbus, have been removed to the Dickens Bldg., in Bellaire. The company owns two mines at Neff, and one at Lafferty.

Johnstown, Penn.—The Greenwich Coal & Coke Co. has transferred 161 acres of coal in Greene Township, Indiana County, to the Manor Real Estate & Trust Co., the land holding concern of the Pennsylvania R.R. The consideration is placed at $12,575.73.

Ethel, W. Va.—The George's Creek Coal Co. has given the Roberts & Schaefer Co. of Chicago an order for the mechanical equipment for a 4-track, frame-constructed, "Marcus" patent coal tipple, using "Rands" shaker loading boom, for installation at Ethel, W. Va.

Charleston, W. Va.—The Campbell's Creek R.R. Co. has filed a petition with the Public Service Commission asking for permission to file a tariff on coal shipments from Perryville and Putney to Dana for shipment by river, the tariff to show an increase of 2½c. per ton.

Washington, D. C.—Schedules of the Union Pacific R.R., proposing increased rates on coal in car loads from certain mines in Wyoming and Colorado to interstate points on the Union Pacific, were recently suspended by the Interstate Commerce Commission until Oct. 28 next.

St. Clairsville, Ohio—Oliver Monace and others have organized a coal company and are opening a mine on the Wheeling & Lake Erie R.R. Work on the tipple will be started shortly, while coal will be loaded from a temporary dump in a few days. The side track to the mine has already been laid.

Mauch Chunk, Penn.—As an indication of improved business conditions in the mining region it is interesting to note that a Mauch Chunk foundry and machine company has declined a $3,000,000 order for war munitions, stating that its plant is busily engaged in the manufacture of colliery machinery.

Harlan, Ky.—Several thousand acres of the best coal land in Harlan County will be opened for immediate development when work of grading the new railroad extension from the terminal of the Waisoto & Black Mountain R.R., at Ages, to the mouth of Yocum's Creek is completed. Contractors have started the work.

St. Benedict, Penn.—The Roberts & Schaefer Co., Chicago, has been awarded a contract by the Cherry Tree Coal Co., which is owned by Peale, Peacock & Kerr, for the building of a new "Marcus" patent coal tipple, complete with screening and picking facilities, for installation at Mine No. 15, St. Benedict, Penn.

Mullins, W. Va.—I. W. Clark, a contractor of Graham, W. Va., was recently awarded a contract for the erection of a considerable number of miner's dwellings at the operation of the Devils Fork Coal Co. This firm is opening up its operation, and the new houses must be completed at an early date. The work is to start at once.

Harrisburg, Penn.—Complaint was recently filed with the Public Service Commission by W. P. Boland, of Scranton, against the rates of the Delaware, Lackawanna & Western R.R. Co., charging discrimination. It is alleged that the railroad has interfered with the successful operation of a plant in which the complainant is interested.

Washington, D. C.—The output of bituminous coal in the United States for the first six months of 1915 is estimated by the U. S. Geological Survey to be between 180,000,000 and 190,000,000 tons, the rate of production having been from 85 to 90 per cent. of that averaged during the previous year. Production is now, however, on the increase, having reached its low ebb in March.

Wheeling, W. Va.—The Edgewood Coal Co. recently sold a block of about 800 acres situated three miles east of Wheeling to Pennsylvania and Ohio people. The price is reported to have been in the neighborhood of $75,000. There is a mine in operation on this tract, and it is said that the new owners will operate it on a much larger scale than it has been worked heretofore.

Huntington, W. Va.—Unofficial figures for June show the largest coal tonnage over the Grand Central division of the Chesapeake & Ohio R.R. during a single month in the road's entire history. Approximately 2,100,000 tons of coal were loaded during June, which exceeds the June figures of last year by 60,090 tons. The present coal traffic of the railroad is approximately 80,000 tons per day.

Birmingham, Ala.—It is probable that one of the Sloss-Sheffield Steel & Iron Co.'s furnaces at North Birmingham will go into blast within the next week or 10 days. This will make four furnaces going into blast in the Birmingham district in the near future. Considerable improvement in business conditions in the immediate territory composing the Birmingham district is evidenced by these signs of returning industrial activity.

Tuscaloosa, Ala.—The Pratt Consolidated Coal Co.'s steamer "N. Carney," with two barges of coal in tow, the first to come from above Lock 17, on the Warrior River, recently passed Tuscaloosa, bound for Mobile. The barges were built at the Pratt company ship yards at Holt, and were loaded with 1000 tons of coal each. The company will make a careful estimate of the cost of handling coal by barge which will largely govern its plans for future shipments.

Lexington, Ky.—H. L. Burch, manager of the traffic department of the Lexington Board of Commerce, recently went to Louisville to confer with D. M. Goodwyn, general freight agent of the Louisville & Nashville R.R., over the matter of freight rates. On account of their advantage as river points both Louisville and Cincinnati have better freight rates on coal than Lexington, though in many cases the coal is actually hauled through Lexington to those places.

Covington, Ky.—Holders of mortgage notes of the Phoenix Jellico Coal Co., of Laurel County, Ky., have brought suit in the United States district court at Covington, Ky., for the appointment of a receiver for the company. A total indebtedness on the notes amounting to $46,000 is alleged and it is also asserted, as a ground for the receivership, that the company is insolvent, and that its business has been neglected, rendering the security of the noteholders inadequate.

Whitesburg, Ky.—The Baltimore & Ohio R.R. is entering the eastern Kentucky coal field for its supply of coal as orders aggregating 150,000 tons have been placed with Harlan County operators. It is expected that the Elkhorn Coal Co. at Kona, Ky., in the Boone's Fork field will also close contracts with the B. & O. shortly for a 25,000 ton order for the next few months. In the past the B. & O. has been getting a large part of its supply from the West Virginia field.

Birmingham, Ala.—Since the opening of Lock 17 on the Warrior River, and the inauguration of barge traffic in coal from this district to the Gulf, there has arisen a complaint that an overcharge of pilotage has been made. An investigation was made and an agreement has been effected whereby the Pilots Association has reduced the pilotage on coal one half. Senator H. T. Hartwell of the Finance and Taxation Committee of the legislature, says the legislature will pass a bill removing all reasonable objection to the present system of pilotage at Mobile.

Philadelphia, Penn.—During May of the present year the Philadelphia & Reading Ry. carried 1,349,796 tons of bituminous coal as compared with 1,101,288 tons in May, 1914. The Reading, without a bituminous mine on its entire system, carries a greater tonnage of this coal than it does of anthracite, in which latter kind of fuel it is the leader. Of course the carriage of bituminous is not nearly so profitable because of the fact that the railway company must share the freight with the originating lines and thus anthracite continues to furnish the chief source of traffic revenue.

Lewis, Wash.—The Davis anthracite coal mines case, which has been pending 18 years, has just been settled in favor of two nephews, H. K. Davis of Lewis and S. A. Davis of Chehalis, Wash. Patents will soon be issued for them. The claims were taken up some 20 years ago, but rangers at that time reported them more valuable for timber than for coal. Meanwhile, it is said, New Yorkers jumped the claims. Since that time, they have been tied up in litigation. The coal tests 86 per cent. carbon and on the claims there are said to be seven veins making a total of 52 ft. of solid coal.

South Bethlehem, Penn.—The Lehigh Coke Co. has awarded a contract for the erection of a $300,000 benzol plant to the Carl Still Co., a German concern. The byproducts which are used extensively in the manufacture of high explosives, reliable sources state will be stored for the present. The Lehigh Coke plant is producing 2000 to 2500 tons of coke per day, 212 ovens being in operation. The output will be increased about 50 per cent., as the 150 additional ovens will be placed in operation shortly. H. Koppers & Co., Chicago, have begun work on erection of 212 new ovens, to be completed by April, 1916.

Bellaire, Ohio—The Sunday Creek Coal Co., the largest operator in the Hocking valley, is closing its mines and stores in the Hocking valley, since it is impossible to mine coal in Ohio and to sell the coal at a profit warranting operation. The company will continue operations in its West Virginia properties and await improvement of fundamental conditions in Ohio. Factors against successful working in Ohio are asserted to be the Green coal screen law; preferential rates accruing advantage to West Virginia as against Ohio producers; and the cost of mining, which in West Virginia is far below the cost in Ohio.

Pittsburgh, Penn.—The Standard Underground Cable Co. has been awarded a gold medal, or highest award in its class, by the International Jury of Award, Panama-Pacific International Exposition for its exhibit of a complete line of electric wires, cables and cable accessories. This is the seventh award of this degree which has been received by this company in as many different expositions, and as its products have never been in similar competition oftener, this constitutes a perfect score. The exhibit consisted of samples of bars and insulated wire and cables of different kinds. Cable terminals, junction boxes and other cable accessories are also shown in considerable variety adapted to various classes of service.

Philadelphia, Penn.—Mayor Blankenburg has made the statement that his administration has saved the city during the past year $5,000,000, due to the business-like methods instituted in every department. He particularly cites a saving of over $100,000 in the amount of coal used by the various bureaus during the past year, stating that the tonnage has been continuously decreasing since the beginning of his administration, despite the fact that the city has grown and the population increased. As proof of his assertion tonnage figures for the past three years are given as follows: 1912, 270,339; 1913, 256,089; 1914, 223,316 tons. Estimating the consumption for 1915 to be the same as 1914 there has been a reduction in the purchases since 1911 of 144,648 tons.

Philadelphia, Penn.—The Supreme Court on July 2 heard the argument in the suit brought by the St. Clair Coal Co. and the Alden Coal Co. to test the validity of the 1913 coal-tax act. The case had reached the court on an appeal from the decision of the Dauphin County Court declaring the act valid. The argument offered was practically similar to that before the lower court in that the act was special and local legislation and also in violation of the constitution because it bore on more than one subject—the levying of a tax and then the distribution to the various municipalities and townships in the producing counties. Following the usual custom of the Supreme Court the case has been held under advisement and it is not likely that it will render an opinion for some little time.

New York, N. Y.—The Delaware, Lackawanna & Western Coal Co. is taking steps to comply with a recent ruling of the U. S. Supreme Court requiring that the business of the coal company and of the Lackawanna R.R. be entirely disassociated. E. E. Loomis has resigned the presidency of the coal company, while W. H. Truesdale, vice-president, and Geo. E. Baker, Jr., director, have also resigned their positions. The fact that these officers and directors of the coal company were officers and directors of the railroad were commented upon in the court ruling as an indication of the connections between the companies. The board has authorized the officers of the company to execute a new contract, which shall conform to all matters questioned by the Supreme Court as either illegal or objectionable.

Coal Trade Reviews

General Review

Retailers have full stocks of anthracite and the dullest period of the year is now at hand. Bituminous exports again break all previous records, but domestic market continues under heavy pressure. Middle Western circulars advanced.

The dullest month of the year in anthracite is now at hand. Some operators report the situation as no slower than usual but retailers have apparently accumulated as much coal as they propose to. Prices continue at a low level and some of the individuals are finding the going hard because of their lack of storage facilities. Mine operations continue heavily restricted, and the production for last month showed a decline of more than 800,000 as compared with the same period of last year.

Bituminous is quieter if anything, although there is still a general note of optimism throughout the trade, and the agencies are confident that the next price revision will be upward. Curtailed industrial operations over the holidays tended to reduce the surpluses, and this has been further accentuated by the general tendency among consumers to draw on their reserve supplies. This, together with another uniform smashing of previous export records, are the chief factors of a constructive nature in the market. The June movement over the Hampton Roads piers exceeded the previous high mark by more than 100,000 tons and the gross foreign movement from Atlantic coast ports for the month will be approximately a quarter of a million tons more than any previous record. Otherwise the situation is discouraging; stocks are large so that delays in transportation occasion no anxiety, and the trade is thoroughly in the grip of the customary midsummer dullness.

In spite of the stir in coke and steel circles, agencies in the Pittsburgh district are competing keenly for any business that appears, and even more attractive quotations are being developed on contracts to Apr. 1; competition has been especially severe for a large railroad contract now being negotiated. Some demurrage coal is noted, and there will very probably be more. Export business is helping the situation very slightly, but it cannot attain sufficient proportions to affect the general situation in the Pittsburgh district.

The drastic action of the Sunday Creek Co. in abruptly ordering a complete cessation of operations at all its Hocking Valley mines, has had a bad sentimental effect on the Ohio trade. There is some stocking, but dealers appear confident of being able to get shipments as required and competition is very strong for what business develops. Some distress coal has recently been forced on the market at ruinous prices which has made the consumers even more confident that they will be able to continue buying at low prices indefinitely.

The July 1 advance in the Middle Western circular occasioned a slight month-end spurt and created a better feeling in the trade. There has been a general advance all along the line and shippers are showing a disposition to hold the circular as the minimum, which is in welcome contrast to the demoralized conditions that have prevailed for the past several weeks. Outlying districts appear to be taking very little coal, and a heavy buying movement is anticipated in this direction later. The continued encroachment of the Eastern coals into the Middle Western district is causing much concern.

A Year Ago—Curtailed mining in the anthracite regions and the market continues under heavy pressure. Eastern bituminous situation dull but gradually improving toward the West. Lake movement unsatisfactory. Agreement reached in the Ohio wage scale.

BUSINESS OPINIONS

Iron Age—Developments of the week show a further improvement in steel trade conditions and prospects. Increasing production, accompanied by increasing demand, indicates that the summer months will show no letdown. They may even be marked by activity on a larger scale. The June contract period ended with a very considerable volume of business taken at prices from $1 to $3 below those now asked, and specifications came in freely at the last. Pittsburgh reports that June business in many cases exceeded that of any month in a year, while in the Chicago district, where the improvement in the spring months by no means kept pace with that at Pittsburgh, June bookings were nearly double those of May.

Boston News Bureau—It is difficult to imagine a more favorable position for the long pull than the fact that we are selling products abroad at our own prices and buying foreign holdings of American securities at our own prices. We hold the upper hand coming and going. We are also steadily increasing our gold supply either in the actual metal or gold contracts. As trade follows the flag, so confidence follows gold. At the moment, Great Britain is liquidating American securities of the best character in order to subscribe to the new British war loans. Sterling exchange shows the effects of this selling, although some of the strength may be attributed to the negotiations to place a British loan in New York of $100,000,000 or more.

Dun—Prospects at the opening of the second half of the year afford a striking contrast to those of six months ago. Then, new problems were presented that made the outlook extremely uncertain, whereas business has since become more fully adjusted to the unusual conditions created by the war, and the future is now viewed with equanimity rather than concern. The record of the first half of 1915 is largely one of difficulties encountered and obstacles surmounted, and the fundamental soundness of the economic structure is demonstrated by the steady recuperation from effects of the previous strain.

Marshall Field & Co.—Current wholesale shipments of dry goods have been heavier than during the corresponding week a year ago, and collections are good. A larger number of buyers were in the market than for the same period last year.

Bradstreet's—Further improvement, notwithstanding vagaries of the weather and slow movements at some points, is the outstanding feature of this week's reports. Where the weather has been favorable, seasonable goods have moved from the counters of retail dealers in larger volume, and though clearance sales have been a stimulus to this line, faith in the future is marked. Crops, collectively considered, are promising, some of them more so than ever before. War orders are of enormous proportions; brass mills in New England, sold far ahead, are intensely active.

ATLANTIC SEABOARD

BOSTON

Concessions still offered f.o.b. and delivered prices low. Georges Creek again in short supply coastwise. Market for Pennsylvania grades continues to improve slightly. Anthracite shippers fairly well supplied with orders.

Bituminous—The Pocahontas and New River situation shows no change from a week ago. Some of the factors still have coal they are pressed to sell and that accounts for the unevenness in prices. Other shippers have a sufficient amount of business in hand, both coastwise and off-shore, and they talk of better conditions in a month or so. No buying, however, has developed of any consequence. Stocks are large and even contract demand has sagged off. A week ago there was only one coal boat discharging at the largest railroad terminal here. Prices for delivery inland remain at the low level established by "market cargoes" earlier although the concerns who have re-handling facilities of their own are now making the prices. The demand here is unlikely to improve before September at the earliest.

Cargoes are being despatched in record time at all the Hampton Roads piers and there is certainly no shortage of coal. The movement coastwise has been retarded by weather but such is the state of trade that a week's delay would be hardly noticeable. The only possible chance of upset is a strike next spring.

Georges Creek is again in short supply at Philadelphia and at New York. A fortnight's notice is required in some cases and tonnage at Baltimore is loading rather slowly. It is likely that Georges Creek transportation for New England will soon be loading again at Hampton Roads in order to keep contractors supplied.

The better grades from Pennsylvania continue to show slight improvement. One of the disadvantages faced by new coals in this territory is that the operators are required to give extended options pending trial of the coal. It is the sign of the times just now that several of these options are being withdrawn. Certain of the Cambrias and Somersets that are available for export are participating in a fair share of the off-shore business—more than was expected.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.20@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.45@2.85	2.92@3.02	
New York*	2.40@2.95	2.75@3.15	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.65@2.80
Boston†	....	....	....	3.60@3.78
Providence†	....	....	....	3.50@3.73

* F.o.b. †On cars.

Water Freights remain as last quoted. There is no particular demand for tonnage and on the other hand there is no great amount of it seeking charters.

Anthracite—While there is no activity in domestic sizes, there is a fair amount of buying, and the shipping companies are not filling orders very promptly. Retail prices were advanced in Boston 25c. on all sizes, effective July 1. The new schedule is:

Broken	$6.75	Pea	$5.75
Egg	7.50	Shamokin	7.75
Stove	7.50	Franklin	8.75
Nut	7.75		

NEW YORK

Practically no spot orders for bituminous coal. Pennsylvania operators report better business. Anthracite a trifle stronger. Operations still curtailed.

Bituminous—The scarcity of spot orders continues in the soft-coal trade. Contract coals appear moving as well, if not better, than for some weeks. As anticipated the reports for June show that the export business exceeded all expectations with a still better outlook for this month.

The holiday affected shipments noticeably this week and most of the mines were idle nearly the full week; this had a tendency to strengthen the market in regard to supply, but not in prices. Demand from New England is gaining strength. Pennsylvania operators report increased orders for the better grades. Manufacturers are drawing on their reserve supplies and the work of replenishing these must soon begin.

Operators are now feeling the effects of the labor shortage. Many Italians and other foreigners have left the mining regions for their native lands while others are seeking employment in regions where work is steadier.

Some shippers report practically no spot business and none in prospect until fall. Inquiries for export coals continue to be received. Unofficial reports indicate that the exports from the Atlantic seaports for June were 256,695 tons more than those of May.

Current quotations are on the following basis:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.30@3.40	$3.30@3.40	$3.30@3.40	$1.75@1.85
Georges Creek Tyson	3.00@3.10	3.00@3.10	3.00@3.10	1.45@1.55
Clearfield:				
Medium	2.65@2.80	2.55@2.65	....	1.10@1.25
Ordinary	2.55@2.60	2.55@2.60	....	1.00@1.10
Broad Top Mountain				1.10@1.45
Cambria County:				
South Forks	2.90@3.05	....	....	1.35@1.50
Nanty Glo	2.75@2.80	....	....	1.20@1.25
Barnesboro	2.65@2.70	....	....	1.10@1.15
Somerset County:				
Quemahoning	....	2.70@2.85	2.70@2.85	1.20@1.30
Medium	2.65@2.70	2.60@2.65	2.60@2.65	1.10@1.15
Latrobe	2.45@2.55	....	....	.90@1.00
Greensburg	2.75@2.80	....	....	1.10@1.15
Westmoreland	2.95@3.20	....	....	1.15@1.40
West Virginia Fairmont ¾		2.60@2.70	2.60@2.70	.80@ .90
Fairmont mine-run		2.50@2.60	2.50@2.60	.70@ .80
Steam		2.45@2.50	2.45@2.50	.90@ .95
Western Maryland		2.35@2.40	2.35@2.40	.80@ .85

Anthracite—While there has been no increased demand for anthracite there is not so much at the docks and the market is a little stronger. The lack of business and the holiday caused some of the companies to close down for a week, while most of the others suspended operations for three or four days. This had a beneficial effect on the situation.

Production for June is believed to have been at least 400,000 tons less than the same month last year when the shipments were 6,130,186 tons. It is believed that the total movement for the first half of the current year will fall nearly a million tons short of that for the corresponding period of 1914.

Some wholesale dealers report a better call and are looking forward to an early fall business. The demand from the West has picked up some. Locally the situation is weak. Tidewater coal is moving slowly though the demand along the line is a trifle better.

Individual coals are the longest, with chestnut leading; some cargoes of this size are said to have been sold at about the April circular while stove and egg have been quoted at from 10 to 20c. off. The suspension of mining had a good effect on the steam-size situation. The supply on hand has been greatly reduced and the situation has eased up notably. There is a tendency toward better prices. Pea coal continues off with some of the cheaper grades quoted at very low prices.

Current quotations are as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.85		$4.90	
Egg	5.10	$4.80	5.15	$4.85
Stove	5.10	4.80	5.15	4.85
Chestnut	5.35	5.00	5.40	5.05
Pea	3.35@3.50	2.70@2.95	3.40@3.55	2.75@3.00
Buckwheat	2.50@2.75	2.05@2.30	2.55@2.80	2.10@2.35
Rice	2.00@2.25	1.70@1.85	2.05@2.30	1.75@1.90
Barley	1.75@2.00	1.45@1.70	1.80@2.05	1.50@1.75

PHILADELPHIA

Summer dullness pervades the anthracite market, with prices low. Individual operators troubled with car demurrage. Pea still low but with production fairly well taken care of. Bituminous very quiet, with good tide shipments to foreign ports.

Anthracite—The market is now in the first of the two worst months of the year, but conditions are probably not as bad as expected. As a matter of fact some shippers say they are doing even better than last year, considered from the standpoint of tonnage. It is practically an idle season for the retail dealers, as they have taken into storage about as much coal as they intend to and this leaves them with plenty of time and opportunity to place their yards in condition for the expected good fall trade.

Prices still continue low, but there are those who profess to believe that the lowest point has been touched. If there is any particular size in demand it is stove; a large sale of a good quality of this size has been reported at the circular price. On the other hand quite a quantity of chestnut has been sold at from 20c. to 30c. off circular. Several dealers report that during the past week they have been offered all the domestic sizes at the April circular.

Pea coal, of course, continues to be offered at low figures, but no one seems to be actively pushing this size, and it is not likely that any lower prices will be made. If anything, pea has slightly stiffened owing to the large orders placed for delivery over the summer and the restricted working time at the collieries. The smaller sizes are not in active demand, although some of the companies are a little hard pressed to supply the special steam grades. Short working time has affected the production of sufficient broken coal to meet the demand on contract orders.

The dull market has made it expensive for the individual operators to keep their collieries working on short time, as some of them must do to fill contracts. Having no place to store the slower sizes, demurrage has mounted up. It is known that one firm was compelled to release an entire trainload of coal this week at April prices less the 2½% tax on this account.

Collections are still very slow.

The circular prices to which the 2½% state tax must be added, are as follows:

	City	Tide		City	Tide
Broken	$3.20	$4.45	Pea	$2.50	$3.25
Egg	3.45	4.70	Buckwheat	1.25	2.25
Stove	3.70	4.70	Rice	.85	1.75
Chestnut	3.85	4.95	Barley	.50	1.50

Bituminous—If anything, the market is even a little more quiet. The closing down of the large cement plants in eastern Pennsylvania on account of the holidays has thrown quite a tonnage of slack on the market, which will cause some annoyance until it is moved. Prices are practically without change and considered to be about as low as they can possibly get, the feeling being that the only revision possible is upward. Tide shipments are holding up well, with fairly good inquiries from foreign sources.

The following prices are the general market on the various grades:

Georges Creek Big Vein	$1.65@1.75	Fairmont gas, mine-run	$1.15@1.25
South Fork Miller Vein	1.50@1.60	Fairmont gas, slack	.65@ .75
Clearfield (ordinary)	1.00@1.20	Fairmont lump, ordinary	.85@ .95
Somerset (ordinary)	1.00@1.15	Fairmont mine-run	.75@ .80
West Va. Freeport	.85@ .95	Fairmont slack	.45@ .55

Philadelphia ocean charters have been reported as follows:

Vessel	Nationality	To	Tons	Terms
Ardgarroch	British	Marseilles	3100	
Veneiro	Italian	W. Coast Italy	3308	
Millie R. Bohannon		Wilmington, N. C.		1.10
Henry S. Little		Summerside, P.E.I.		2.25

*Starfond	Norwegian	Havana	2256	
Geo. D. Edmonds		Summerside, P.E.I.	2256	

Steamers are indicated by **bold face** type. * Steamships.

HAMPTON ROADS

Export and coastwise movement heavy. All previous records broken during month of June. Total movement 1,437,319 tons.

Dumpings during the past week have been heavy. The largest amount of the exports has been taken by Italy. The largest single cargo of the week was loaded into the Panama collier "Achilles" which took 12,000 tons of cargo and 1200 tons of bunkers for Cristobal.

In addition to coal movement there has been one large cargo of coke loaded for Valparaiso. Nut and slack and high volatile coal has moved in small quantities to the New England ports but the heaviest cargoes have been either New River or Pocahontas run-of-mine. Export cargoes have practically all been New River or Pocahontas, very little high volatile coals being exported from Hampton Roads at any time.

The demand both for export and coastwise cargoes has been good and some large sales for prompt shipment are understood to have been made. Few of the shippers at this time have any large surplus of coal on the railroad yards and the accumulation at Tidewater appears to be decreasing considerably.

During the month of June the piers at Hampton Roads broke all previous records, the total movement for the three railroads being 1,437,319 tons. Previous to June the record was for 1,307,747 tons which was made during May. Of the total dumpings for June the Norfolk & Western Ry., at Lamberts Point, handled 853,845 tons, the Chesapeake & Ohio at Newport News 350,343 tons and the Virginia Ry. at Sewalls Point 233,131 tons.

Railroad Tonnages—Dumpings over the local piers for the past several weeks compare as follows:

Railroad	Week Ending June 5	June 12	June 19	June 26	July 3
Norfolk & Western....	156,011	197,533	207,824	213,279	211,017
Chesapeake & Ohio....	44,702	89,447	71,511	79,870	83,678
Virginian............	38,372	34,975	51,644	87,840	58,455
	239,085	321,955	330,979	380,989	291,828

The following vessels have cleared from Hampton Roads during the week of June 18 to 25:

Norfolk

Vessel	Destination	Tons
Wascana[1]	Rio de Janeiro	7161
Italia[2]	Torre Annuziata	7000
Panama Transport	Valparaiso	*4959
Ydun[3]	Georgetown, Dem.	1700
Chiswick[1]	Barbadoes	3000
Worrior	Buenos Aires	5205
Clifton	Sierra Leone	5949
Edward B. Winslow	Rio de Janeiro	5011
Rosalia L.	Genoa	9440
Wegadesk	Canal Zone	6500
Circe	Gibraltar	3977
North Dakota	Naples	7106
Malang	Rotterdam	4884

[1] Smokeless Fuel Co. [2] Pocahontas Fuel Co. [3] Castner, Curran & Bullitt. * Coke.

BALTIMORE

Prices fairly well maintained despite light demand. Contracting period practically over. Export business remarkable and port record here is broken.

There is little or no new business. The contracting season is practically at a close and the coal men are urging coal forward on contract obligations. Despite the light demand prices were fairly well maintained. Specialized coals like Georges Creek or South Fork sell at good figures, the former bringing from $1.35 to $1.75 for top grade, and the latter around $1.40. Pennsylvania line coals as a whole are bringing from 90 and 95c., for low grades, to $1.15 and $1.20 for good standard coals. B. & O. coals, like low-grade West Virginia and Western Maryland steam fuels are offering at 75 and 80c., with medium to best grades bringing $1.10 to $1.25. Fairmont gas three-quarter sells around 85c., and slack is weak at 50c.

A remarkable export business is being done out of this port. June broke all records for shipment on foreign account. A total of 305,917 tons was dumped into vessels for foreign delivery. Italy took the largest amount, 127,744 tons, and Argentina was next with 98,516 tons. While July is not expected to equal this record, the movement will undoubtedly be heavy.

The following steamers were announced chartered for the export loading from this port:

Vessel	Nationality	Destination	Rate
Styliani Bebis	Greek	West Coast of Italy.	$10.08
Kanaris	Greek	West Coast of Italy	9.88
Ulida	British	Alexandria, Egypt	10.80
Quenmore	British	Barcelona	8.88
Lewis H. Goward	American	Porto Rico	
Urd	Norwegian	Stockholm	

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce", as follows:

Vessel	Nationality	From	To	Tons	Rate
Maasdik	Dutch	Baltimore	Buenos Ayres[3]	2935	$8.28
Dorington Court	British	Virginia	Italy[2]	3019	9.84
Eleni Stathatos	Greek	Virginia	Italy[2]	1871	9.12
Petritsis	Greek	Virginia	Italy[2]	2352	9.60
		Philadelphia	Barcelona	7200	8.88
Urd	Norwegian	Baltimore	Stockholm	1968	
Campeiro	Brazilian	Baltimore[1]	Italy[2] [5]	1605	10.80

Mariteres	Spanish	Virginia	Casablanca	1943	9.60
Ulidia	British	Baltimore	Alexandria	1988	
Augusta W. Snow		Norfolk	Rio Janeiro	671	
Eleanor F. Bartram		Baltimore	Rio Janeiro	920	
Bayard Barnes		Philadelphia	Bahair	954	7.75

Note—Steamers are indicated by **bold face type**, all others being schooners.
[1] Or Virginia. [2] West Coast. [3] Or La Plata. [4] And Algiers. [5] Or Sicily.

OCEAN FREIGHTS

Freights show little change. Orders for charters to the Plate accumulating.

Freight conditions are practically the same as a week ago. Although a number of steamers were chartered for export coal, the rates have varied but slightly from previous quotations. A steamer was recently chartered from a United States port north of Hatteras to Genoa at $9.36. Plate orders from here are accumulating, which is rather surprising as grain freights from the Plate have considerably improved recently.

The freight market is now quotable as follows:

To	Rate	To	Rate
Havana...............	$2.00@2.25	Bermuda..............	**$3.00**
Cardenas or Sagua......	**2.75**	Vera Cruz.............	3.50@3.75
Cienfuegos............	2.75@3.00	Tampico..............	3.50@3.75
Port au Spain, Trinidad.	3.50@3.75	Rio..................	**8.64**
St. Lucia.............	**3.50**	Santos*..............	**8.88**
St. Thomas............	3.00@3.25	Montevideo...........	**8.34**
Barbados..............	3.50@3.75	Buenos Aires or La Plata	**8.40**
Kingston..............	2.75@3.00	Rosario..............	**8.88**

Santiago..............	2.50@3.00	Barcelona**...........	**8.40**
Guantanamo...........	2.50@3.00	Valparaiso or Callao....	6.75@ 7.00
Demerara.............	**4.25**	Marseilles............	**8.64**

Note—Rates noted in **bold face** type are only approximate.
* Consignees paying dockage dues. **Spanish dues for account.
W. W. Battie & Co.'s Coal Trade Freight Report.

LAKE MARKETS

PITTSBURGH

Market no better, perhaps worse. Contracts to Apr. 1 at substantially prompt prices. Slack easier. Operations 50 to 60%.

If there has been any change in the local coal situation in the past week it has been for the worse. Operators both large and small are keener to secure business and while prices for free coal are not materially lower, more attractive quotations are made on contracts to Apr. 1, prices substantially as low as have lately been quoted for prompt. There have been free sellers of ¾-in. to Apr. 1 at $1.10, while mine-run for the same period has been offered at approximately $1. At the beginning of the season Lake coal was quoted at $1.15 and sales at $1.10 were regarded as representing cut prices, whereas now $1.10 can sometimes be cut.

Slack has softened further and Pan Handle is freely offered at 45c., while Youghiogheny gas slack can be had at 50c. The Baltimore & Ohio coal requirements for the Pittsburgh division are about to be let, for a twelvemonth, and there is a scramble for the business. It is understood that as low as $1 has been bid on the twelvemonth, for mine-run, and in view of the prospective wage adjustment Apr. 1 this is equivalent to a somewhat lower figure for the period to that date.

One or two Connellsville district operators are doing a very fair business in coal for export to Italy, and expect the business to increase, but the Pittsburgh district proper is not able to participate, having higher production cost. The following quotations represent the usual asking prices for free coal, sometimes shaded, and in a measure represent prices that might be done on contract: Slack, 45@50c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. Mines are operating at between 50 and 60% of capacity.

BUFFALO

Minor signs of improvement, mostly in coke. Local business continues dull. Anthracite not improved.

Bituminous—There are outside indications that the demand is improving; the stir in steel and coke has not been felt to any extent by coal, but it must follow some time. There was a general shutting down of all sorts of business over the holiday. Nothing is really active and several city coal jobbers have dropped business entirely for several days and gone off on vacations.

There is some coal on track, paying charges and there is likely to be more; the idea appears to be general that the demand is going to improve and the output is running up, with the surplus mostly unsold, to put the market in bad shape till the actual improvement appears. The bituminous prices continue on a basis of $2.70 for Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack. The slack trade is very dull and prices are being cut badly.

Anthracite—The trade is still as dull as ever. All branches are so slack, except the movement to the Lakes, that it is necessary to restrict the mining and this is being done more and more as the season advances, with small prospect of any change for the better right away. As a rule the retail dealers are letting the trade take care of itself. The movement of coal by Lake continues as active as ever, the figures slightly exceeding last year to date. For the week the total is 140,550 tons; for June, 618,236 tons and for the season, 1,420,378 tons, as against 1,409,325 tons to the end of June last season.

TORONTO, CAN.

Industrial conditions show no improvement and trade the dullest for years. Threatened stoppage in manufacture of war materials.

Dealers state that trade has not been so quiet for many years. Industrial conditions show no sign of improvement, except as regards the activity in shell manufacture, and the continuance of this industry is threatened by the recent announcement of the British Government that hereafter no more empty shell cases will be accepted. Manufacturers have not the equipment for loading shells and hesitate about procuring it unless assured of large and steady orders. Many skilled mechanics are leaving for England. Prices for best grades are as follows: Retail anthracite egg, stove and nut, $7.50; grate, $7.25; pea, $6. Bituminous, retail, steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $8; wholesale f.o.b. cars three-quarter lump, $3.56; screenings, $2.90.

CLEVELAND

Especially low prices quoted at the opening of the week. Very little coal on track and buying at the low point of the last four weeks.

Inventories at almost all of the big manufacturing plants greatly reduced the demand for coal this week; the number closed is the largest since the first of the year inventory. It will be the latter part of next week before the demand for coal again reaches normal. There has been no attempt to cut prices this week because the places in which to put coal are so limited. A buyer can, however, get about any price he wants to pay within the range of the last two weeks.

Lake shipments are at the lowest point since the season got underway. July is usually a light month and the docks this summer are unusually well provided with coal. The Soo canal report for June shows a decrease in Lake Superior shipments as compared with June 1914. Last month 300,631 tons of hard coal was shipped as compared with 414,401 tons a year ago. The soft coal traffic totaled 1,624,535 tons as compared with 1,846,689 tons a year ago.

Prices for shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	Ohio No. 8
Lump	$3.45	......	......	....	......
Lump, ¾ in	.....	$2.15	$1.90	$1.85@1.90	$1.85@1.90
Egg	3.45	......	......	....	......
Mine run	2.65	2.05@2.10	1.80	1.80	1.75@1.85
Slack	......	1.45	1.45	1.45	1.45

COLUMBUS

No improvement. Steam business slow and Lake trade is not increasing materially. Stocking is showing up better than formerly.

Little or no improvement is noted in the Ohio trade. In fact some of the coal men believe it is growing worse as is shown by the closing of all of the mines of the Sunday Creek Coal Co. on the Hocking Valley side of the field. The tone of the market is not good and competition is getting very strong. There are no hopes for much improvement in the immediate future.

Stocking of domestic coal is going on but the buying is not as vigorous as was expected. Dealers are apparently loath to accumulate stocks under present conditions, relying on their ability to get shipments promptly when the demand is felt. The approach of the threshing season is expected to stimulate some buying. Retail prices are fairly well maintained and dealers are not inclined to cut prices in order to force trade.

Lake trade is likewise rather quiet. Congestion on the docks of the Upper Lake ports is still reported and the movement off the docks to the interior is limited. Some Ohio coal is going to the Northwest but the larger percentage loaded at Toledo is from West Virginia mines. The Hocking Valley docks at Toledo loaded 82,000 tons during the week ending July 2.

The steam business is dull in every locality. Buying is being done on a limited scale as consumers are not inclined to accumulate stocks. Manufacturing is still low, with the exception of war supplies. The demand for the small sizes is still good but a larger production has weakened the market.

Prices in the Ohio fields are:

	Hocking	Pomeroy	Kanawha	Eastern Ohio
Rescreened lump	$1.45	$1.50		
Inch and a quarter	1.35	1.35	$1.30	
Three-quarter inch	1.25	1.30	1.25	$1.20
Nut	1.15	1.25	1.15	....
Mine-run	1.05	1.10	1.05	1.00
Nut, pea and slack	.70	.75	.65	.65
Coarse slack	.60	.70	.55	.55

Mines have been working at about the following percentage of full capacity:

	Week Ended					Week Ended			
District	June 12	June 19	June 26	July 3	District	June 12	June 19	June 26	July 3
Hocking	25	25	25	25	Cambridge	35	30	30	20
Jackson	20	15	20	25	Masillon	40	35	30	15
Pomeroy	50	50	45	30	Eastern O.	30	45	50	40
Crooksville	30	30	25	55					
					Average	33	33	32	30

CINCINNATI

Continued dullness, with much surplus coal, has resulted in frequent heavy price concessions, on both contract and spot coal. No early improvement can be expected.

Some ruinous prices have brought the market in this vicinity very close to demoralization, as far as actual business is concerned. When four-inch lump coal is offered at less than a dollar a ton on a contract, as it was in this vicinity recently, it is apparent that the market is in a bad way. Nut and slack can, of course, be had at much lower figures, especially for spot coal, which has to find buyers at any price.

These factors have only increased the indifference of buyers strengthening their belief that there is no use in tieing themselves up on contract. The technical position of the market is regarded as fundamentally strong, in view of the slenderness of reserve stocks everywhere, but the present market is completely flat and will apparently recover slowly.

LOUISVILLE

Beginning of the stocking movement the only encouraging factor in the situation. Prices varying over a wide range.

Market conditions in Kentucky are showing something of an improvement, with the nearer approach of the end of July, when the retailers' stocking operations begin in earnest. The first part of the month saw a considerable improvement in the number and tone of inquiries and these promised fairly well. Industrial conditions and requirements are showing no particularly extended improvement; whenever a buyer appears he is bombarded from all sides by sales representatives.

Prices show a wide range, eastern Kentucky block varying from $1.25 to $2, according to quality, etc., and all other grades based on these prices. Nut and slack ranges from 25 to 65c. a ton. Pea and slack in Western Kentucky are very scarce, due in a considerable measure to the fact that the Illinois Central is taking straight run-of-mine coal and not screened coal as formerly was the case.

BIRMINGHAM

Both steam and lump coal show improvement. The demand for steam coal, especially, is much larger than for several months, while lump coal shows a very healthy increase. Blacksmith coal is normal.

COKE

CONNELLSVILLE

Independents advance wages to Frick scale prompted by some labor troubles. Market dull and unpromising. Temporary firmness in spot furnace on account of holiday.

The independent operators that made wage reductions last year, largely in the early part of the year, have been forced to return to the Frick scale. The strike of the Washington Coal & Coke Co. operatives week before last, resulting in their being granted the full Frick scale, showed the other operators that they would have to restore the old wages, or lose men if not encounter strikes, and one by one they have announced the restoration, the leading independent, W. J. Rainey, also joining the group. Thus the operators are given higher costs, by perhaps 10c. a ton, while the coke market affords them no better opportunities.

Consumers are showing very little interest in contract coke and the consumptive prospects are not particularly bright. Late last week two furnaces that were using merchant coke blew out, one at Steubenville, a steel works stack, and the merchant furnace at Girard. As a rule it is only the steel works that make their coke that are increasing their furnace operations. Late last week spot furnace coke stiffened 10c. a ton, on account of the approaching holiday and it is possible that later this week enough furnaces will find themselves short of coke to bid up the spot market temporarily. Most shippers, however, have increased their shipments somewhat, and have also accumulated some coke on track. Foundry coke is rather quiet again, and the total quantity contracted for the twelvemonth beginning July 1 is unusually small. The market is quotable at $1.60 for spot furnace, $1.75 for contract furnace to Jan. 1, $2@2.50 for spot foundry and $2.20@2.50 for contract foundry, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended June 26 at 355,478 tons, an increase of 6968 tons, and shipments at 346,377 tons, a decrease of 5399 tons.

Baltimore—Coke is still more or less a drug on the market like the less desirable grades of coal. Connellsville 72 hr. is offered as low as $2.30, with 48-hr. at $1.65. West Virginia 72-hr. sells at about $2 to $2.15, and 48-hr. at from $1.55 to $1.60.

Buffalo—There is considerably more activity in coke than for some time and the output is already increasing. Some members of the trade report an advance in price, while others are positive that none has taken place in this market. An advance must occur soon if the reports of large increase of output continue. Prices are stronger on the basis of $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

Chicago—Spot sales of coke are less than last week, but contract shipments have been moving in steady volume. Further advances in steel products incline wholesalers here to the view that a better era is at hand. Domestic coke was somewhat slow the past week. Prices are as follows: Byproduct, $4.65@4.85; Connellsville, $4.75@4.90; Wise County, $4.75; gas coke, $3.75@4.90, furnace, $4.65@4.75.

MIDDLE WESTERN

GENERAL REVIEW

Prices for Indiana and Illinois coals narrowing with better buying of domestic sizes reported. Screenings slightly softer. All-rail anthracite shows no better demand.

Some life has been injected into the domestic trade the past week due to increased buying by retailers. An advance in circular prices has occurred on all Western coals, and the present attitude of shippers is to consider these list prices as the minimum. Most mines are still operating on an average of not more than three days per week, except in southern Illinois where there has been better running time.

The anticipated recovery in screenings did not materialize, and they have again declined an average of 5c. per ton on current shipments; it is apparent that this is due to increased production of coarse sizes and the strike of the building trades in Chicago, which has closed down factories, causing decreased consumption of screenings and steam coals. No revival of country buying has transpired so far, mainly due it is said to scarcity of ready cash in the country districts. The purchase of threshing coal this year has been in less volume due to the extended use by farmers of straw burners and gasoline tractors for power. There has been a further increased movement from southern Illinois mines to Northwestern markets. More West Virginia and Kentucky fine coal is under contract for movement into northern Indiana points than ever before. Contracts have been let for Kentucky screenings in northern Indiana and southern Michigan at prices as low as 65c. per ton at the mines.

CHICAGO

Some general price advances on the first of the month. Market still continues dull. Eastern coals gaining strength. Anthracite unusually dull.

Franklin County domestic sizes advanced to $1.50 on the first and shippers are firmly holding for this price. Screenings have declined about 10c. per ton from this field.

It is expected that the Harrisburg and Saline County operators will closely follow the lead of the Franklin County operators in advancing prices. Screenings from these mines have eased off at least 5c. per ton during the week.

Aside from a little increase in domestic sales, the situation at the Indiana mines is devoid of interest. Prices for domestic sizes remain stationary. Contracts are still being made largely at last year's figures, and in some cases less.

Clinton operators advanced domestic prices, and report a slightly better demand for these coals. Steam coals from these mines, however, are weaker.

No change has occurred in the demand for Springfield district coals except that screenings are slightly softer. Domestic lump has been marked up to $1.50, effective July 1.

The smokeless trade is still conspicuously firm, and Western shipments are closely restricted. Pennsylvania smokeless is moving slowly, but the operators are sacrificing no coal in the open market and prices are firm at June circular.

Better inquiries are reported for July delivery of Hocking, and increased strength is noted in all sizes.

Eastern Kentucky coals are still on the bargain counter, and prices quoted are on shipments from the mines, spot sales in many cases being made at considerable less figures.

The dealers did not avail themselves of the low prices prevalent in June for anthracite to the extent anticipated, and while the latter part of the month showed some increased buying, it was not of the normal strength of other years. Notwithstanding the market is unsatisfactory, prices are well maintained with a few minor exceptions. The July outlook is decidedly uncertain. Prices f.o.b. cars Chicago are as follows:

Chestnut	$6.80 to 6.90	Grate	6.30 to 6.40
Egg and stove	6.55 to 6.65	Pea	5.50 to 5.55

Yard prices 25c. higher.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

Receipts by Lake—Arrivals of coal by Lake for June and the season to date for this year and last year were as follows:

	1915		1914	
From	Hard	Soft	Hard	Soft
Buffalo	90,306	10,400	61,203	
Owego	15,685		23,036	
Toledo		18,730		63,467
Cleveland		20,808		12,640
Sandusky		10,325		49,236
Erie	27,044			
Ashtabula			7,222	
June total	133,035	60,263	91,461	125,343
Total season to date	258,246	163,570	171,253	256,416

INDIANAPOLIS

Thresher demand causes some improvement. Decline in screenings expected. Encouraging crop outlook.

The domestic lump trade shows some improvement due to the opening of the demand by threshermen, now busy with the wheat crop and soon to handle the oats. Whether this will increase the supply of slack enough to weaken the price remains to be seen; there is no doubt buyers of screenings are expecting a decline. There is no indication yet of weakness. Other grades of coal are down to their minimum, run-of-mine ranging from $1 to $1.20, according to quality.

The war-material industries of the state continue at capacity and an additional plant or two swings into this business weekly. There is pronounced improvement in operations at Gary, and allied industries feel a reflected benefit. In spite of material damage by insects and storms, Indiana will probably have 40,000,000 bushels of wheat, her oats crop promises to be the largest in years, and she raises 200,000,000 of corn, which is coming along satisfactorily. Coal men are counting on this to bring about a decided improvement in due time.

Retail dealers seem to be stocking up with Eastern coals in a normal way for the month of July. Summer prices on these still prevail. There is a fair movement of these coals from the yards into consumer's bins.

ST. LOUIS

Increase in the local circular. Prices better maintained and better feeling in the trade.

July 1 brought a welcome and longed-for strengthening of prices in the St. Louis market, particularly in the standard grades, where the prices have been demoralized for the past several weeks. During the past week intimations were received by the Kolb Coal Co. from some of the independent operators who are alleged to have brought about the recent price-cutting, that they were anxious to get better prices; the deadlock was broken by the Kolb Co. announcing, effective July 1, an advance on 2-in. shaker screened lump coal from 77½ to 85c. per ton f.o.b. mine. The Miller Coal & Coke Co. at the same time announced an advance of the same amount on standard lump. While the changes in other grades were not so pronounced there was a better feeling all along the line except in screenings, which fell off somewhat.

The market is now quotable as follows:

	Wilm. & Frnk. Co.	Sparta	Mt. Olive	Standard
6-in. lump	$1.25@1.35	$1.25	$1.25	$0.95
2-in. lump	....	.90	1.25	.85

Screenings	.70@ .75	....	....	.75@ .77½

PORTLAND, ORE.

Summer storage prices in effect and but little business is transacted, as expected. City buys 2000 tons of coal and briquettes for schools.

Summer prices have been put in effect and Washington coals are now selling at $6.50 per ton in larger than three-ton lots or $7 per ton in one-ton lots. Wyoming is selling at $9 straight. These quotations cover deliveries within the first zone. The city has placed orders for 2000 tons of coal and coal briquettes, with three firms, this being the largest order placed here for some time. (See contract No. 362). Indications are that there will be very little if any coal imported here from Australia the coming fall and winter.

PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

Anthracite shipments for June and the first six months of 1914-15 were as follows:

	June		6 Months	
	1915	1914	1915	1914
Phila. & Reading	852,411	944,816	5,413,271	6,031,648
Lehigh Valley	988,253	1,325,982	6,299,848	6,155,075
Cent. R.R. N.J.	609,127	839,514	3,798,849	4,389,087
Del. Lack. & West.	888,399	941 868	4,568,608	4,598,506
Del. & Hudson	697,894	661,248	3,803,792	3,415,875
Pennsylvania	446,690	470,652	2,969,954	3,217,088
Erie	693,089	738,175	3,747 082	3,990,027
Ont. & Western	140,239	207,931	993,900	1,148,483
Total	5,316,102	6,130,186	31,595,304	32,945,789

Stocks at Tidewater June 30 were 739,729 tons.

LAKE SHIPMENTS

Shipments through the Sault Ste. Marie Canals for June were: Bituminous, 1,624,535; anthracite, 300,631 tons.

SOUTHWESTERN TONNAGE

The following is a statement of the coal shipments by months from the four Southwestern states for the past two years to and including April of the current year:

1913	Missouri	Kansas	Arkansas	Oklahoma	Total
March	259,270	492,304	113,354	257,162	1,122,090
April	204,255	444,142	136,153	246,155	1,030,705

RATE DECISION

I. C. C. No. 7409—Reeves Coal Co. vs. Chicago, Milwaukee & St. Paul Ry. Co.

Complainant ordered a shipment reconsigned, provided the lowest rate between original point of origin and final point of destination would apply. Reconsignment was effected and lawful charges, higher than those which would have accrued at the lowest rate from point of origin to final destination, were collected; **Held,** That the case does not differ materially from one involving merely a misquoted rate. Complaint dismissed.

FOREIGN MARKETS

GREAT BRITAIN

Situation very uncertain and important developments expected. Restrictions of exports continues.

June 25—The situation in the coal industry has many interesting features, but they are not of a character to encourage or facilitate business. Much uncertainty for instance, prevails as to what the Government may think proper to do with regard to coal prices and in view of the further negotiations between colliery representatives and the Board of Trade in London this week, an early authoritative announcement on the subject is expected, but the inland trade has received something of a check pending that. Then there is the question as to whether there is any likelihood of the suspension of the Eight Hours' Act, which apparently has been under the consideration of the Miners' Federation of Great Britain this week, while in Wales trouble over the non-Unionist difficulty and the new agreement causes anxiety. Finally we have continued complaints concerning the restriction of exports, the main effect of which appears to be the depression of prices for the benefit of our customers in neutral countries, although, of course, the home market for some qualities has also been weakened. Altogether the situation is far from satisfactory, and important developments are expected.—The Iron & Coal Trades Review."

June 24—There is still general quietness in all branches of the steam coal trade. Shipments are slightly improving. Prompt supplies can be had at several shillings below current quotations. Quotations are approximately as follows:

Best Welsh steam	Nominal	Best Monmouthshires	$6.72@6.96
Best seconds	Nominal	Seconds	6.24@6.72
Seconds	$6.72@7.20	Best Cardiff smalls	4.80@5.04
Best dry coals	6.72@7.20	Cargo smalls	3.96@4.08

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is very quiet and rates are approximately as follows:

Gibraltar	$3.84	Naples	$6.00	St. Vincent	$4.80
Marseilles	4.83	Alexandria	5.76	Rio de Janeiro	6.36
Algiers	3.86	Port Said	5.64	Monte Video	5.76
Genoa	5.88	Las Palmas	4.32	River Plate	6.00

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

For the official advertisements of bids wanted see the Contracts-to-Be-Let Section on Page 20.

+Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared.

No.	Purchaser	City	State	Tonnage	Page
817	Barrett Varnish Co.	Chicago	Ill.	3 (cars)	1048
856	Board of Education	Kansas City	Mo.	7000a	40
950	Board of Education	Linden	N. J.	200a	40
969	County Commissioners	Hillboro	N. D.	200b	41
988	Government Engineer	Atlantic City	N. J.	3000b	42

a Indicates anthracite coal. b Indicates bituminous.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

+No. 726—New York—All the bids on this contract (Vol. 7, pp. 916, 955, 1004, 1084, 1088, 1128), which provides for furnishing the local Fire Department with coal, have been rejected, and the contract will be readvertised. Address Fire Comr. Robt. Adamson, Municipal Bldg., New York City.

+No. 855—Wilmington, N. C.—This contract (Vol. 7, p. 1085), which provides for furnishing the United States Engineers at this place with about 13,000 tons of bituminous coal was bid on as follows:

Bidder	F.o.b. Cars at Wilmington	Southport*	Washington	Newbern	Morehead	B.t.u.

*Delivered in bins. † Without restrictions as to guarantees.

Address Maj. H. W. Stickle, Corps of Engrs., U. S. Engineers' Office, Wilmington, N. C.

+No. 870—Peoria, Ill.—Bids on this contract (p. 1086) were received until 5 p.m., June 25. The successful bidder will be required to furnish a bond for $4000, and each bid is to be accompanied by a certified check for $200. Address Secy. Anna Rynearson, Bd. of School Inspectors, Room 203, City Hall, Peoria, Ill.

+No. 888—Fairbury, Neb.—This contract (Vol. 7, p. 1086), which provides for furnishing the G. D. Meyers Water & Light Commission at this place with about 2000 tons of coal will be let some time in July. The price as noted in the previous item, $2.95 should have read $3.75 per ton. Address G. D. Meyers Water & Light Commission, Fairbury, Neb.

+No. 892—Jacksonville, Fla.—This contract (Vol. 7, p. 1086), which provides for furnishing the U. S. Engineers' Office at this place with about 4000 tons of coal was bid on as follows: Logan Coal & Supply Co., Berwind's New River, $4.42; Weller Coal Co., Admiralty smokeless, $4.85; Clinchfield Fuel Co., Clinchfield coal, $4.24; Logan Coal Co. (exclusive of freight), Pratt lump, $2.75. Bids were also open for delivery at Tampa, the only bidder being the Tampa Coal Co. at $6.15 for Superior Pocahontas. Address U. S. Engineers' Office, Jacksonville, Fla.

+No. 893—Milwaukee, Wis.—Bids have been received on this contract (Vol. 7, p. 1086), which provides for the requirements of the Lighthouse Service, 12th District, as follows:

Bidder	Amount		Place of delivery.
Milwaukee-Western Fuel Co. (Milwaukee)	$800.00	*	Milwaukee, Wis., Anth.
Pennsylvania Coal & Sup. Co. (Milwaukee)	8632.80	*	Milwaukee, Wis., Bit.
Callaway Fuel Co. (Milwaukee)	815.00	*	Milwaukee, Wis., Anth.
Pittsburgh Coal Co. (Chicago)	540.00	*	Chicago, Ill., Bit.
Charlevoix Coal & Wood Co. (Charlevoix)	2464.50	*	Charlevoix, Mich., Anth. & Bit.
Wm. H. Pugh (Racine)	337.50	*	Racine, Wis., Bit.
C. Reiss Coal Co. (Sheboygan)	908.00	*	Sheboygan, Wis., Bit.
Central West Coal Co. (Menominee)	1143.75	*	Menominee, Mich., Bit.
George Kemp (Sault Ste. Marie)	556.50	*	Sault Ste. Marie, Mich., Bit.
Perry Coal Co. (Sault Ste. Marie)	567.00	*	Sault Ste. Marie, Mich., Bit.
Mich. Lumber Co. (Manistee)	866.00	*	Manistee, Mich., Bit.
C. B. Oliver (Escanaba)	1164.00	*	Escanaba, Mich.
Marinette Fuel & Dock Co. (Marinette)	1214.25	*	Marinette, Wis.

Recommended that the above bids he accepted as indicated*.

+No. 937—Amsterdam, N. Y.—About a dozen bids were submitted on this contract (Vol. 7, p. 1127), all of which were apparently the same as follows: Grate, $6.50; egg, stove and nut, $6.75; pea, $5.75. An extra charge of 25c. per ton will be made in event the coal has to be carried, and a discount of 25c. per ton will be allowed where payment is made by the tenth of the month succeeding delivery. Deliveries are to begin Sept. 1. Address Clk. Leslie L. Bedd, Bd. of Edu. High School Bldg., Amsterdam, N. Y.

New Business

No. 990—Kansas City, Mo.—The General Hospital will let a contract for 100 tons of mill run coal Aug. 1. The board of directors makes the contracts. Address Board of Directors, General Hospital, Kansas City, Mo.

No. 991—Storrs, Conn.—Sealed bids will be received until noon, July 20, for furnishing the Connecticut Agricultural College with coal as follows: 1000 tons anthracite egg; 200 tons pea; 100 tons stove; 50 tons nut. Bids should be made f.o.b. Eagleville, Conn., and deliveries are to be made during the period of Oct. 1 of the current year to Mar. 31 of next year. Separate bids should be submitted on each size. Address Connecticut Agricultural College, Storrs, Conn.

Contract No. 922—Rock Island, Ill.—The contract with the Standard Oil-Cloth Co. for two cars of screenings per week expires on Apr. 1. This company will contract in August for the supply for the following season. Address Standard Oil-Cloth Co., Rock Island, Ill.

No. 993—Kansas City, Mo.—The Southwestern Milling Co. buys its coal in the open market and will be interested in offers. Two cars a month of mill run are used. Address Purchasing Agent, Southwestern Milling Co., Kansas City, Mo.

+No. 994—Canton, Ill.—Sealed bids were received by the local City Government until 2 p.m., June 15, for furnishing coal required at the Ave. D. Pumping Station, during the year beginning July 1. Mine-run and screenings will be required. The successful bidder must furnish a bond for $500 guaranteeing the faithful performance of the contract. Address City Clk. Joseph Waugh, Canton, Ill.

+No. 995—Cedar Rapids, Ia.—The Board of Education at this place will receive bids until 7:30 p.m., July 13, for furnishing coal as follows: 5000 tons of fancy Iowa or Illinois steam coal delivered on sidings; 30 tons lump coal to be delivered as designated; 60 tons of anthracite to be delivered in bins on or before Sept. 1. All bids must be submitted on blank forms which may be obtained on application. Bids will be received at the same time for delivery of the coal from the cars to the various buildings. Address Secy. H. L. Cooper, Cedar Rapids, Ia.

No. 996—Baltimore, Md.—The American Smelters Securities Co. is completing a new brass foundry at this place, for which it is now negotiating for the fuel supply. The plant will be in operation in about two months, and shipments are scheduled to start Sept. 1. About 2000 tons of egg coal will be required. Address Purchasing Agent, American Smelters Securities Co., 120 Broadway, New York City.

+No. 997—Salina, Penn.—The School Board for Kiskiminetas Township will receive bids until 10 a.m., July 14, for furnishing the coal required at the 20 schools in the district. Address W. J. McCauley, Bd. of Edu., Salina, Penn.

+No. 998—Kansas City, Kan.—The municipal contract for furnishing the city, water-works plant, electric-light plant, city buildings, etc., will be let about Aug. 1. though no notices have as yet been sent out. About 20,000 tons of mill-run coal will be required. Address Pur. Agt. Amos Riddle, City Hall, Kansas City, Kan.

+No. 999—Brookville, Ohio—The Board of Education at this place will receive bids until 7:30 p.m., July 12, to furnish its annual coal requirements for the fiscal year beginning July 20. Address Clk. J. M. Grau, Bd. of Edu., Brookville, Ohio.

1000—Independence, Mo.—The Independence Ice & Cold Storage Co. at this place is considering a contract for furnishing its coal supply, which aggregates about two cars per month. It uses slack and mill-run coal, and at present is buying in the open market. Address Mgr. A. D. Hatton, the Independence Ice & Cold Storage Co., Independence, Mo.

+1001—Wilkes-Barre, Penn.—The Board of Education at this place usually contracts for its fuel requirements some time in August. The call for bids is advertised and the business is let on a competitive basis. About 4000 tons of coal is required, with prices varying from $2.40 to $4.20 per ton. Address Board of Education, Wilkes-Barre, Penn.

+1002—Lafayette, Ind.—The Board of Public Works at this place will receive bids until July 14 for furnishing the coal required during the ensuing year at the local waterworks, crematory and fire department. Address Committee on Supplies, Board of Public Works, Lafayette, Ind.

1003—Kansas City, Mo.—The Wesley Hospital at this place is receiving bids for about 150 tons of bituminous coal. The contract will be let about Aug. 1. Address Board of Directors, Wesley Hospital, Kansas City, Mo.

1004—Mitchell, S. D.—The County Commissioners will receive bids until 2 p.m., July 16, for furnishing Davison County with the following grades of coal: Pocahontas lump to be delivered at the Court House; same to be delivered to any part of the city; Hocking lump delivered to Court House; anthracite, egg and stove delivered to any part of city. Address County Audr. J. M. Crampton, County Comrs., Mitchell, S. D.

1005—Cleveland, Ohio—The Board of Education at this place will receive bids until noon, Aug. 2, for furnishing and delivering coal to the various school buildings during the seasons of 1915 and 1916. The approximate tonnages are as follows: Anthracite, 300 tons; bituminous lump, 3000 tons; nut, 2500 tons; slack, 25,000 tons; semibituminous mine-run, 4000 tons; lump, 4000 tons. Specifications and blank forms for bidding may be obtained on application. Address Dir. of Schools F. G. Hogan, School Headquarters, Rockwell and East Sixth St., Cleveland, Ohio.

1006—Kansas City, Kan.—The local plant of Proctor & Gamble Manufacturing Co., dealer in soap, will be in the market about Aug. 1 for 200 tons of bituminous coal. Address Purchasing Agent, Proctor & Gamble Mfg. Co., 19th and Kansas St., Kansas City, Kan.

1007—New Castle, Penn.—The School Board at this place will contract some time in August for its annual requirements of coal. The present contract is on the following basis: 1800 tons of ¾-in. coal at $2.33, 550 tons of slack at $1.92, prices including cost of delivery to buildings. The call for bids is advertised. Address Board of Directors of School District, North St., New Castle, Penn.

1008—Galesburg, Ill.—The County Commissioners at this place will receive bids until 10 a.m., July 7, for furnishing the coal requirements of the Knox County Court House and Knox County Heating Plant for the year beginning July 1. Nut, slack, mine-run, egg and lump coal will be required. Bids are to include cost of delivery to the Court House and heating plant. The successful bidder will be required to give a bond guaranteeing the satisfactory performance of the contract. Address County Clk. F. L. Adams, Galesburg, Ill.

1009—Independence, Mo.—The Independence Stove & Foundry Co. will contract for about 12 cars of slack coal some time during August. Address Secy. E. F. Lough, Independence Stove & Foundry Co., Independence, Mo.

1010—Kansas City, Kan.—The Kansas City Soap Co. at this place is considering the purchase of 12 cars of mine-run and lump coal, deliveries to be made at the rate of one car per month. The company has heretofore confined its purchases to the open market. Address H. L. Fetters, Kansas City Soap Co., Shawnee and Railroad St., Kansas City, Kan.

+1011—Ritzville, Wash.—The School Board at this place received bids until July 5 for furnishing 125 tons of coal to be delivered to the various school buildings on or before Sept. 1. Bids were particularly requested on Roslyn Cascade Special Steam coal, but will also be considered on other grades. Address Dist. Clk. John Truax, School Dist. No. 1, Ritzville, Wash.

1012—Pleasant Hill, Mo.—George M. Kellogg, a florist at this place, will contract for a year's supply of coal some time during the current month. About 20 cars of slack coal per month will be required. Address Pur. Agt. N. F. Parker, George M. Kellogg, Pleasant Hill, Mo.

+1013—Jackson, Miss.—Bids were received by the Mississippi State Penitentiary until noon, July 6, for furnishing two carloads of coal for the Oakley and Parchman convict farms. The bids were requested f.o.b. the destination with freight prepaid. Address Secy. J. J. Coman, Mississippi State Penitentiary, Jackson, Miss.

+1014—Keewatin, Minn.—Sealed bids were received by the Town Government until 8 p.m., June 30, for furnishing approximately 500 short tons of coal. Deliveries are to be made between July 14 and Jan. 13. Bids were requested on Elkhorn, Ky., lump, mine-run, screenings, Youghiogheny screened lump, mine-run, screenings. Address Village Clk. C. W. Extrum, Keewatin, Minn.

1015—Kansas City, Mo.—The City Ice Co. is said to be considering entering into short contracts for its coal requirements. About one car per day is required and it is stated that it is considering purchases in 30-car lots. Address F. D. Whiting, City Ice Co., 21st and Campbell St., Kansas City, Mo.

+1016—Bel Air, Md.—The Board of School Commissioners for Harford County received bids until noon, July 7, for furnishing its annual coal requirements. No. 2 screened anthracite coal is required almost exclusively. All deliveries are to be completed on or before Oct. 1. Address Secy. Charles T. Wright, Bd. of School Comrs., Bel Air, Md.

1017—Mobile, Ala.—The city will receive bids until noon, July 14, 1915, for furnishing a year's supply of coal, to be delivered at the Spring Hill and Bienville pumping stations. Copy of specifications can be had by applying to Supt. C. W. Soost, of Mobile Water Works. Bids must be accompanied by guaranteed analysis. Address Comr. Harry Pillans, Mobile, Ala.

1018—Kansas City, Mo.—The Kelley Milling Co. at this place will probably contract about Aug. 1 for its fuel requirements, which amount to about 20 tons per day. It uses Cherokee slack coal. Address J. M. Kelley, Jr., Rochester and Park Ave., Kansas City, Mo.

+1019—Allentown, Penn.—The School District of North Whitehall Township will receive bids until 5 p.m., July 10, for furnishing 100 tons clean chestnut coal to be delivered to the various school buildings on or before Sept. 13. Address Secy. A. N. Kuhns, Orefield, Penn.

+1020—Adrian, Mich.—The State Industrial Home for Girls at this place will receive bids until noon, July 13, for furnishing about 2000 tons of domestic lump coal and 250 tons of chestnut coke. Bids should be submitted f.o.b. cars on side track at the home. Address Treas. Rolla L. Taylor, State Industrial Home for Girls, Adrian, Mich.

1021—Kansas City, Mo.—The Western Sash & Door Co. will contract about Aug. 1 for 20 cars of mill-run coal. Address F. J. Huttig, Western Sash & Door Co., Independence Rd. and White Ave., Kansas City, Mo.

+1022—Chicago, Ill.—The Municipal Tuberculosis Sanitarium received bids until noon, July 9, for furnishing the coal requirements of the Sanitarium according to the specifications on file. A certified check for $300 was required with each bid. Address Board of Directors, Municipal Tuberculosis Sanitarium, North Crawford and Peterson Ave., Chicago, Ill.

Contracts Awarded

No. 650—Pittsburgh, Penn.—This contract (Vol. 7, pp. 835, 918) has been awarded to various coal companies. Address Supt. of Supplies C. N. McKee, Fulton Bldg., Pittsburgh, Penn.

+No. 747—Pittsburgh, Penn.—This contract (Vol. 7, p. 917), which provides for furnishing the various pumping stations and the City Hall and Hospital, has been awarded to a number of the different local companies. Address Dir. F. P. Booth, Dept. of Supplies, 314 Oliver Bldg., Pittsburgh, Penn.

+No. 631—Milwaukee, Wis.—An additional award on this contract (Vol. 7, pp. 795, 876, 918), providing for the requirements of the Milwaukee Fire Department, has been made to the **Kanawha Fuel Co.,** at $3.41 per ton for 800 tons of Pocahontas, and $7.50 per ton for 553 tons of anthracite. Address Comr. F. G. Simmons, Department of Public Works, Milwaukee, Wis.

+No. 556—Grand Rapids, Mich.—This contract (Vol. 7, p. 709), which provides for furnishing the local Board of Education with its fuel requirements, aggregating between 7000 and 8000 tons of West Virginia coal, has been let as follows: **Bennett Fuel & Ice Co., Kanawha,** $2.94, and New River, $3.80; **Breen & Halladay,** anthracite, $8. Address Board of Education, Grand Rapids, Mich.

+No. 729—Vicksburg, Miss.—This contract (Vol. 7, pp. 916, 1984) which, provides for furnishing the Third District of the Mississippi River Commission with approximately 10,000 tons of coal was awarded to the **West Kentucky Coal Co.,** on June 18. The contract will run during the fiscal year ending June 30, 1916. Address Maj. Engrs., J. R. Slattery, U. S. Engrs. Office, Third Mississippi River Dist., Vicksburg, Miss.

No. 766—South Bethlehem, Penn.—This contract (Vol. 7, p. 956), which provides for furnishing coal to the local schools, has been awarded to the **Stahn Coal Co.** as follows: Pea, $3.90; nut, $5.75; stove, $5.50. Other bids were: South Bethlehem Coal Co., pea $3.80, nut $5.65, stove $5.50; Artificial Ice Co., pea $4.05, nut $5.70, stove $5.55; Sancon Supply Co., pea $3.95, nut $5.85, stove $5.70. Address Secy. George E. Borman, Bd. of Edu., South Bethlehem, Penn.

No. 674—New York, N. Y.—Awards on this contract (Vol. 7, pp. 836, 876 and 956), with reference to the supply of coal for the schools in the Borough of Richmond, action upon which was deferred when the contracts for the other boroughs were awarded, have been made by the Board of Education. The contract was awarded to the **Richmond Ice Co.,** the only bidder. Address Supt. of School Supplies Patrick Jones, Board of Education, Park Ave. and 59th St.

+No. 740—San Antonio, Tex.—This contract (Vol. 7, pp. 917, 1084), which provides for furnishing the San Antonio School Board with its fuel requirements during the ensuing fiscal year, has been awarded to the **Mission Wood & Coal Co.** at $5.25 for Wilburton nut and $6.35 for Carona 6x3-in. fancy lump. Of the 10 bids received on this business this company was the lowest and best. Address Business Agt. Paul H. Scholz, Bd. of Edu., Prudential Bldg., San Antonio, Tex.

No. 678—New Brunswick, N. J.—This contract (Vol. 7, pp. 876, 1048), which provides for furnishing the fuel requirements of the local Board of Education for the ensuing year has been awarded to **P. M. Welsh,** on the following basis per gross ton: Egg and stove, $6.57; pea, $4.99; buckwheat, $3.51; bituminous, $4.10. The coal is to be weighed on the city scales and delivered and stored as required. Address Secy. Morris Bauer, Supply Com. Bd. of Edu. New Brunswick, N. J.

No. 598—New Orleans, La.—This contract (Vol. 7, p. 794, Vol. 8, p. 40), which is said to cover the fuel requirements of the United Fruit Co., for the next two or three years, has been awarded to the **Warrior Black Creek Coal Co.,** and the **Pittsburgh Coal Co.,** each concern getting about one-half. It is stated that the Pittsburgh Co. has had this contract exclusively for sixteen years and had it not been for this the Alabama Co. would probably have obtained the entire contract. The coal will be shipped by the L. & N. R.R. Address Pur. Agt. United Fruit Co., New Orleans, La.

+No. 730—Louisville, Ky.—This contract (Vol. 7, p. 916), which provides for furnishing the local Board of Education with its fuel requirements during the fiscal year beginning July 1, has been awarded as follows: **Franklin Coal Co.,** 6277 tons of nut and slack, $1.93; **Pittsburgh Coal Co.,** 1335 tons smokeless mine-run, $3.15; **St. Bernard Mining Co.,** 386 tons lump, $2.25. The contract was let on a heat-unit basis, but no test of the coal will be made unless it fails to give satisfaction, in which event the contract will be cancelled and coal bought in the open market. Address Business Dir. Samuel D. Jones, Administration Bldg., Eighth and Chestnut St., Louisville, Ky.

No. 733—Providence, R. I.—This contract (Vol. 7, p. 917), which provides for furnishing the Board of Control and Supply of the State of Rhode Island with coal during the ensuing year, has been awarded as follows: **H. N. Hartwell & Son, Inc.,** 11,000 tons of "Alpha Special" to Cranston, R. I., at an average of $3.905;**Providence Coal Co.,** 900 tons of "New River" coal for the State Home and School at $4.58, five tons for the Providence Armory and 20 tons for the Providence Armory at $5 per ton; **M. L. Cobb,** 1000 tons of "George's Creek" coal for the State Sanatorium at $4.32; **Logan Coal Co.,** 700 tons of Logan No. 2 to the Rhode Island State College at $4.10. Address Secy. G. R. Parker, Bd. of Control and Supply, State House, Providence, R. I.

Contract Notes

Birmingham, Ala.—The Alabama Co. has closed a contract for 25,000 tons of coal with the Southern Cotton Oil Co., for their mills in this section.

Chile, S. A.—The Chilean Government have issued a decree requiring a deposit of $24.33 for every ton of coal taken by vessels under belligerent flags which sail direct to European ports.

Warsaw, Ind.—The Light & Water Department at this place consumes about 9000 tons of Cambridge (Ohio) coal which usually costs about $2.55 per ton f.o.b. Warsaw. The business is done on competitive bids.

Birmingham, Ala.—The Southern Ry. has let contract for 500,000 tons of coal through Vice-president E. H. Chapman. Two hundred thousand tons will come from the Pratt Consolidated Coal Co., and the other 300,000 tons divided among the Stith Coal Co., Bryan Coal Co., Barney Coal Co. and others.

St. Paul, Minn.—The indications are that the Northern Coal & Dock Co. will be the successful bidders on this contract instead of the Peoples Coal & Ice Co. as previously noted (Vol. 7, p. 1128). The contract provides for furnishing about 17,000 tons of various grades of coal for the City Government.

Brookhaven, Miss.—The Light & Water Works Department at this place consumes about 2600 tons of Kentucky mine-run coal which usually costs about $3 per ton. The company does not contract but the business is let on competitive bids. Address Supt. B. S. Purser, Light & Water Works Department, Brookhaven, Miss.

Crawfordsville, Ind.—The contract to supply 575 tons of coal to the Montgomery County institutions and buildings has been awarded to **Vaughn & Casey.** The bids were for 350 tons of mine-run at $2.55, and 255 tons of mine-run at $2.25. The contract calls for a total expenditure of $1400.75, and in all there were four bidders.

Buffalo, N. Y.—The contract for furnishing the County Home and Hospital of this county with 2500 tons of slack coal has been awarded to **Spaulding & Spaulding.** For furnishing the County Penitentiary with 3600 tons of slack, C. A. & M. Kaiser were the successful bidders at $1.85 per ton on cars. Both bids were practically the same.

Philadelphia, Penn.—Reports have reached here that the Argentine Republic is in the market for 50,000 tons of bituminous coal. The information comes from Buenos Aires that the purchase has been authorized by the home government. It is provided that the cost shall not be in excess of $225,000, and the purchase is to be in charge of that government's ambassador at Washington.

U. S. Production for the Half Year—Output of bituminous coal in the United States for first six months of 1915 is estimated by the Geological Survey as between 180,000,000 and 190,000,000 short tons. The rate of production has been from 85% to 90% of the average for the previous year. This is considerably less than for the corresponding period in 1914, and is little, if any, greater than the output during the last half of that year. Production this year decreased after January, reached the low ebb in March and April, and is now on the increase. Output of anthracite has fallen from 3% to 5% below average for 1914.

The Big Four R.R. Contract—This road is reported to have contracted for 150,000 tons of Harlan County, Ky., coal for shipment during the year, beginning July 1. The contract was distributed among the Harlan Coal Co., the Southern Coal & Coke Co., the Bewley-Darst Coal Co., and the Reliance Coal Co., about a third of the order going to the first named company. This is said to be the first time that the Big Four has ever purchased coal from Eastern Kentucky mines on the Louisville & Nashville, most of their requirements having been obtained in West Virginia. Deliveries will be made at Ohio and Southern Michigan coaling points.

COAL AGE

Vol. 8 NEW YORK, JULY 17, 1915 No. 3

Our Export Coal Trade

Are we taking advantage of all the opportunities now being given us to increase our export coal trade so as to make the United States the greatest nation in this particular field, as it is in output, consumption and coal reserves?

* * *

THE coal tonnage sent overseas during the month of June would seem to show that at last we are reaping the benefit of our more or less persistent effort. The export tonnages last month from our principal ports, compared with those of September, 1914, are as follows:

	June, 1915	Sept., 1914
Hampton Roads	605,000	433,000
Baltimore	325,000	128,000
Philadelphia	105,000	59,000

Our coal exporters are making strong endeavors to increase their sales of coal abroad; it is equally true that in this work there is vast room for improvement in both efficiency and effort. The results of this unexampled increase in export tonnage are: First, the people in foreign countries are learning that they cannot depend on obtaining sufficient shipments of British coal owing to various causes resulting from the war. Second, they have also learned that United States coals can be had that will do the work required just as well as any but the very best Welsh coal (this being entirely out of the market at present). Third, United States coals can now be bought in many foreign markets more cheaply than can British fuel.

For these reasons inquiries for our coals have poured in upon us, and the fact that our exports during the past six months have not been greater is due to the scarcity of ships' tonnage as well as to the indisputable truth that our exporters are not accustomed to selling at delivered or c.i.f. prices.

The real fight for the coal-export trade of the world will come after the war is over.

Are we preparing for that time, and do we intend to try to keep what trade we may secure in the meantime? The present situation is going to be of great benefit to us then. Other people will have learned—because they are now being forced to learn—how to buy and to use our coals, and they will then be aware that the latter are of excellent quality.

But the British and German coal interests are not going to give up without a fight the foreign business that they have spent many years and much hard work and money in acquiring. Even now the British exports for the first five months of the year show a decrease of 35 per cent. over the corresponding period of the previous year (for May the decrease was 39 per cent.). But it must be remembered that a vast tonnage, probably 10 to 12 million tons per year, has been withdrawn from American trade and is being used by the navies of the allied governments. It would seem a wise plan, therefore, for our coal-sales agencies to begin at once to plan how they may best keep the foreign business they are now having presented to them. Wide avenues of trade are being opened to them, and they are learning the ocean-transportation end—the key to the whole export matter.

THE WAY TO have our share of the coal-export trade is to go after it intelligently and systematically — selling coal of good quality at fair prices. Such a campaign would win.

All of this will help us immensely when the real fight for commercial supremacy comes on after the war. But we must systematize our knowledge and our methods and not allow our efforts to relax. We have much to learn from the British shippers who in 1884 were exporting more coal than we are now doing.

The large coal companies should work together more. What benefits one now will benefit all in the end. At present these companies are fighting each other in every way—a fact that the foreign buyers have learned and are making use of to their own advantage.

Few of our exporting companies know foreign trade conditions. Grave errors have been made in selecting foreign representatives, nearly all of whom had everything to learn regarding foreign customs and usages — few of them being able to speak any language save their own.

Why would it not be both profitable and wise for the Bituminous Coal Association or any other association of coal sellers and operators interested in the export trade, such as the Smokeless Coal Operators of West Virginia, to establish a bureau of information regarding foreign trade? The purpose would not be to sell coal, but to gather all available and useful data on foreign coals and markets, prices, analyses, uses, buying and selling methods, specifications, ocean freights and ships, dock and harbor facilities, names of the large users and buyers, etc.? Such a bureau could be made of immense value to those to whom the information gathered would be available; it need not interfere in the least with the selling activities of any company.

Such an office could be used to disseminate general information to foreign buyers and users regarding our coals; it could be made a headquarters for all foreign buyers coming to this country. *Coal Age* would be glad to assist in the establishment of such a bureau and to render every possible aid in obtaining information for it.

Ideas and Suggestions

Prohibition from a Miner's Viewpoint

By an Ohio Superintendent

It appears to me that West Virginia is likely to suffer for want of miners if something is not done to make amends for the suppression of the liquor traffic in that state. As evidence of the unpopularity of that measure and its effect in driving away miners I submit the following letter:

Scarbro, W. Virginia.

Mr. O. P. Rater, Superintendent,

My Dear Super:

I hope you forgive me, because I apply to you for me and Martin again a job. Here is a bad time and bad place for us. Too much and too very much dry. These place back in the West Virginia state now work every day. But we dont care, if your mine work three days a week we should like to come back in your again coal mine. If you can give us again some place for work, maybe wet dog hole, I dont care. Who want to live here and work these mines, alright, but no good for us. Too wild and too very dry. Please write me at once and give we greeting to Mr. Bass. Remaining Yours very truly,

STEVE UNGARY and MARTIN MANCO.

Something news on other side Mr. Super.

I dont drink here since September 30, only coffee and water, no whiskey, nothing. Please write me right away yes or no. The trouble is too much dry and too very much far from Mingo Junction.

Me and Martin no get job close to some place where we can get some whiskey we pretty soon go back and join Franz Josef's army. Lots of whiskey there now.

This is a true copy, word for word, of a letter I received from two Austrians who for a time were working in southern West Virginia. Now the thought comes to me, are we doing right by these miners? The great state of West Virginia is dry; others of the large coal-producing states of the Union are in the dry column or are straining every effort to get there. The curse of intemperance comes with these foreign miners from the East. We stop them from buying liquor here, from frequenting the saloons, from having the only kind of a good time they know, and what are we giving in return? What are we giving them to take the place of this habit?

We cannot dodge the issue—human nature is the same all the world over, and it is a scientific fact that if you would put an end to a habit of any kind in a man, woman or child, you must give them something in place of it. You must divert their minds into channels along other lines, give them some place with other attractions, where they can spend their leisure hours in enjoyments that will tend to make them forget the habit they have renounced.

Now do not think I am in favor of saloons or of the liquor evil, for personally I am and have been a total abstainer and hope to see the day when it will be illegal to manufacture or sell alcoholic liquors as a beverage in the United States. Nevertheless, I stick to the point and believe that we have no right to deprive these miners of their enjoyments, liquor drinking, or of their poor man's club, the saloon, unless we can give them in return something besides work that will take the place of these evils.

West Virginia coal-mine operators have done much for the uplift and social betterment of the mine worker, but much yet remains to be done. Nation-wide prohibition is coming in the United States, so I desire to give this word of warning to coal-mine operators and officials: Be prepared to give the mine workers, by education and otherwise, something to fill the void or be prepared to face an evil from the foreign miner that will be worse than his liquor habit.

One Method of Reducing Coal Mine Accidents

By F. M. McDaniel*

From an examination of the fatal accident reports of the different coal-mining companies in the large coal-producing states for the past few years, it will be noted that these accidents are mainly owing to contributory negligence on the part of the miners and that the greater number of these fatalities are due to falls of coal and slate.

No doubt many of these accidents could be avoided if the miners would exercise and put into practice the safety precautions with which they are familiar and obey the instructions given by the mine foremen, firebosses and other underground officials.

Shakespeare has said, "I could better teach twenty what were good to be done than be one of the twenty to follow mine own instructions." So it is with the average coal miner. He is familiar with and recognizes the different dangers met with in coal mining and the methods and ways of eliminating possible accidents from these dangers. Too many miners, while waiting on empty cars or for their places to be cut or what not, will sit about telling their "buddies" how much they know about the prevention of accidents, when they should perhaps at that very moment better be in their own working places taking down a loose piece of slate, placing a prop or complying with some other order given by the mine foreman or one of his assistants.

The miner has too much of a tendency to gamble with chance. Although he may know that, even when all safety precautions have been complied with, mining still remains a hazardous occupation, he will deliberately work under loose slate or coal and will do other things that he knows are making his work perhaps doubly dangerous. He fosters the belief that because he has worked under conditions similar to those under which he is now working and has escaped injury he will escape again. He bases these makeshift arguments on a bad precedent and neglects to consider that his former escape was probably owing only to a strange caprice of fate that is not always repeated under similar conditions.

If the miners could be taught or induced to put into practice what they really know concerning safety measures and the different precautions against mine accidents; to give stricter obedience to the state mining laws, the company rules and foremen's orders; to weigh carefully and decide upon the value of the safety information readily accessible; to take more pride in their working places; to think less of getting the almighty dollar by taking risks that are not required or expected of them, and to quit trying to load as much or more coal than the other fellow by the expenditure of less muscle and brains, no doubt the number of both fatal and nonfatal accidents in this country could be materially reduced.

---

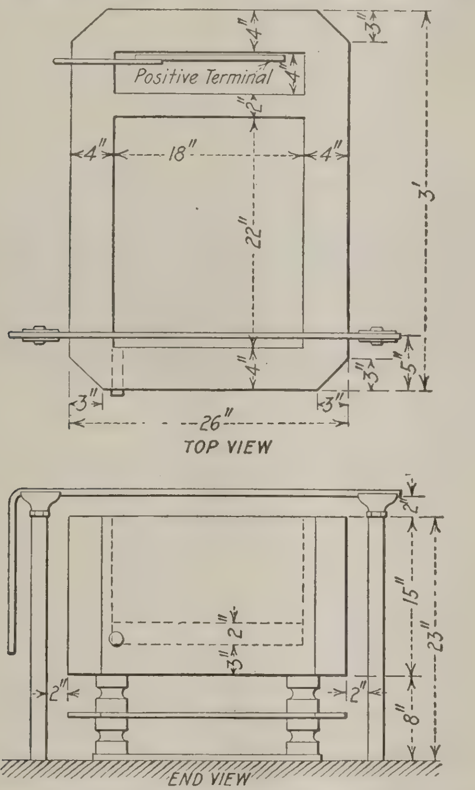
*Mining Engineer, Clarksburg, W. Va.

An Electrolytic Forge

By M. D. Cooper*

An electrically operated forge for use in mines is illustrated herewith. A forge similar in construction to the one illustrated in the figure has given satisfactory service underground for over 6 yr.

Essentially, the forge consists of a concrete tank mounted on suitable insulation, equipped with an iron plate for use as a positive terminal and supplied with the necessary wiring. The tank is 36 in. long, 26 in. wide and 15 in. high. The walls are 4 in. and the bottom 3 in. thick. For the purpose of preventing the piece to be heated from coming in contact with the positive plate and thereby causing a short-circuit, the tank is divided into two compartments by means of a 2-in. wall. This wall, however, does not extend to the bottom of the tank; there is an open space 2 in. high between the bottom of the wall and the bottom of the tank to allow the passage of current and also to facilitate draining when necessary. A drain pipe stopped by a wooden plug is provided as shown in the figure.



TOP AND END VIEWS OF THE ELECTRIC FORGE

The larger compartment of the tank, in which heating is done, is of ample size for most underground requirements. A smaller size was satisfactory for heating rivets only, but experience has shown the necessity for a tank of the dimensions given in order to heat pieces longer than the ordinary sizes of rivets. In the smaller compartment of the tank a wrought-iron plate 14 in. long, 9 in. wide and ½ in. thick is placed, to which wire carrying the positive current is attached.

By means of two sets of four insulators in each set, the tank is insulated from the earth. The foundation is brought to the floor level. On the foundation is placed an iron plate of somewhat shorter dimensions than the bottom of the tank. Near each corner of the plate is located an insulator as shown. A second plate a little longer and wider than the first is placed over the insulators.

It has been found that this upper plate must extend over the lower one in order to prevent any drippings falling from the upper to the lower plate. The second set of insulators is placed directly above the first, and the tank is then supported on the upper set. In general, the insulators have been found to last about a year, when they must be taken out and cleaned or, if cracked, replaced by new ones. To change all of the insulators requires only a few minutes.

The return current is carried by a piece of 0000 trolley wire, which has been found large enough in current capacity and stiff enough to support the pieces to be heated. The wire is held by trolley hangers, rigidly supported near each side of the forge by pieces of 1½-in. pipe.

In operation the tank is filled with water to a depth of 6 in., which requires about 12 gal. Then about 5 lb. of common salt is added, the solution of salt and water forming the electrolyte. The current, which is supplied at 250 volts and must always be direct current, having been turned on, the piece to be heated is held in a pair of tongs the handles of which are rested on the piece of trolley wire supported across the tank. When the rivet or other metal to be heated is lowered into the electrolyte, current will flow from the positive terminal to the piece held in the tongs, which then becomes the negative terminal. A layer of hydrogen is formed around this terminal, causing a high resistance at the surface of the piece it is desired to heat. The resistance results in the development of heat, the amount being proportional to the I^2R loss.

In this manner a rivet or other similar piece of metal may be brought to a high temperature in a few seconds. After the current is shut off, the material may be quenched by thrusting it into the same solution in which it was heated.

He Won (?)

Two little boys were playing on the sidewalk—or rather one little boy was playing; the other couldn't very well, as he was all swathed in bandages, smelled of arnica, and was generally disfigured. A kind-hearted stranger curious to know what had happened asked how he had been hurt. The larger boy answered for the injured one: "We were playing a game, who could lean out of the window the farthest, and he won."

Doesn't this present a true picture of the coal operator who cuts prices below the cost of production or who cuts the cost of production by butchering his mine?

Wire Rope and Its Application*

By Bruce W. Bennett†

SYNOPSIS—To be of value wire rope must be of known quality. It must possess strength, flexibility and tenacity in well-balanced proportion. To secure the results desired great care is exercised throughout the entire process of manufacture. Carelessness or ignorance on the part of the user may render useless the utmost pains and skill of the maker. The wise purchaser therefore studies the conditions of service involved and adapts his rope and apparatus to them, thus securing maximum service for a given outlay.

Although wire rope has been used as a mechanical appliance for nearly 5000 years, it is commonly regarded as a modern invention. During the long period that has elapsed since the first records of its use, wire rope has passed from a crude to a highly developed product, and the purposes for which it is employed have increased many-fold.

In no other branch of industry is there a greater demand for material of proven integrity than in the production of wire rope, for it might be truthfully said that it is born to be abused. It is subjected to tremendous tensile stresses, constant bending, abrasion, corrosion and the peculiar internal changes or molecular readjustments produced by vibration.

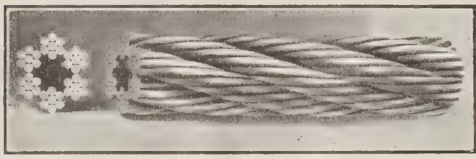

FIG. 1. A 6x7 HAULAGE TRANSMISSION AND STANDING ROPE

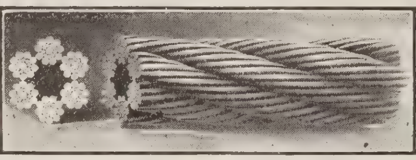

FIG. 2. A 6x19 SEALE CONSTRUCTION, TWO SIZES OF WIRE

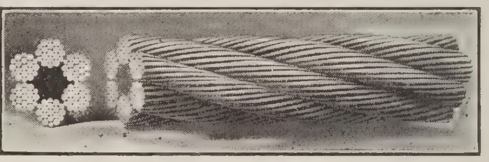

FIG. 3. A 6x19 HOISTING ROPE WITH THREE SIZES OF WIRE

Wire rope as made today is the product of the metallurgist and the mechanic. Every process—from the smelting of the ores, the rolling of billets and rods, the cold drawing of the wires and the many heat treatments they receive down to the stranding or laying up of the cable—is conducted with mathematical precision. The chemist sees that only steel of the proper analysis is used, the electric pyrometer insures uniformity in heat treatments and the various testing machines clearly establish the quality of the product before it is allowed to leave the mill.

Steel for the manufacture of ropes commonly used in the coal fields is the product of acid open-hearth furnaces, and the utmost care is exercised throughout the process of manufacture to insure that the finished product shall be of the desired analysis and of sound structure.

After the material has been cast into ingots and rolled to the form of rods, it is thoroughly cleaned and drawn through dies to the required diameter. Drawing greatly increases the strength of the wire and decreases its elongation under test, but if continued beyond certain well-defined limits, will make the material so hard and brittle as to be useless. To prevent such a contingency the wire is given several annealings, or heat treatments, which when properly conducted restore it to its original state of toughness and ductility, as well as bringing back its elasticity.

Heat Treatments Are Carefully Conducted

The heat-treatment processes are conducted with great care, and nothing is left to chance. The electric pyrometer insures that the wires receive just the degree of heat necessary to produce the desired result. A further check on these processes is secured by means of the microscope.

The very process of drawing the rope wire to a certain extent furnishes proof of the latter's quality, but careful tests for tensile strength, elongation and torsion are conducted by experts. Each and every coil is tested before it is allowed to enter the rope mill.

When the wires are taken into the rope mill they are wound upon spools and placed in a machine which so operates that they are laid into strands composed of 7, 19 or more wires, without any torsion being placed upon them. Each wire receives a heavy lubrication in this process. The strands are then laid about a heavily lubricated center usually composed of hemp, in much the same manner as that in which the strands themselves are built up, the same means being employed to eliminate torsional stresses.

The trade names which have been given to wire ropes of varying degrees of tensile strength are iron, crucible cast steel, extra strong crucible cast steel, plow steel and monitor plow steel. The tensile strengths will range from a minimum of 60,000 lb. per sq.in. of cross-section of stock for iron to approximately 280,000 lb. per sq.in. for monitor plow steel or its equivalent. The ropes most commonly used in the coal field are of the crucible cast steel grade and will approximate 200,000 lb. per sq.in. in tensile strength.

Most wire ropes have a hemp center, the name given to designate various types of fibrous material. In places where ropes have to withstand severe heat, soft-iron centers are substituted, and where crushing stresses are encountered or additional strength must be secured, steel centers are adopted. Asbestos centers, while heat-resisting, rapidly disintegrate and are of practically no value.

It is important that only good centers be used. If the hemp center disintegrates or breaks, the strands have a tendency to fall inward, causing the rope to collapse. When one or more strands do this, even tension is destroyed, and those strands having to bear the greatest stress will probably break.

The lay of a rope is the direction in which the wires and strands are twisted. There are three standard kinds of lay—right-hand lay, left-hand lay and Lang's lay, commonly known as lang-lay. In a right-hand lay the wires are twisted to the left and the strands to the right. In a left-hand lay just the opposite is true. In a lang-lay rope the wires and strands are both twisted in the same direction.

---

*Abstract from a paper presented before the Shamokin and Mt. Carmel Mining Institute.

†American Steel & Wire Co., Wilkes-Barre, Penn.

The length of lay of a rope is the distance from the crown (top) of a strand to the next crown of the same strand; that is, one complete twist or revolution of 360 deg. from the crown of one wire to the succeeding crown of the same wire. The standard length of lay for hoisting rope is 7 diameters, which in the case of a 1-in. diameter rope would be a 7-in. lay. Shortening the lay of a rope adds to its flexibility. Increasing the length of the lay increases the stiffness.

Five different types of construction ordinarily employed in laying up wire rope are—a 6x19 3-sized wire; a 6x19 1-sized wire; a 6x19 Seale patent construction with 2-sized wire; a 6x16, known as cable construction, and 6x7 haulage rope.

The ropes most frequently employed are of the 6x7 and 6x19 construction, or to more fully express the foregoing designation, a rope composed of 6 strands of 7 wires each about a hemp center or 6 strands of 19 wires each about a like center. The 6x19 construction is modified as to disposition of the metal in several ways. The first and earliest type of construction was that in which all of the 19 wires in one strand were of one size, but for most purposes what is known as the 3-sized wire 6x19 rope is preferable, as considerably more metal can be used per given diameter, thereby increasing the strength of the rope and its ability to withstand abrasive wear.

The 6x19 Seale patent construction is one in which all the outer wires of each strand are considerably larger than the inner wires. It is designed exclusively for work where abrasion must be considered the factor of greatest importance. A 6x16 construction is sometimes employed where the 6x19 3-sized wire construction does not quite meet the requirements as regards abrasive wear and where the 6x19 Seale patent type is considered unadapted.

The type frequently employed in the coal regions is known as a 6x19 standard hoisting construction. Each strand is composed of 19 wires—the 7 inner wires of one size, while the 12 outer wires are of two different sizes. Such a construction gives the greatest area of material that it is possible to obtain and at the same time secures a more flexible rope.

It is good practice when once a construction which is giving satisfactory service is secured to stick to it. On slopes and planes a limited variation as to construction is possible. For instance, where there is heavy friction and abrasive wear constructions with larger outer wires might be tried out with good results, provided of course that the drums and other conditions are suitable for such a change; for increasing the size of wire in a certain diameter of rope tends to stiffen it.

For certain uses, such as shaft sinking where a wire rope is used to hoist an unguided bucket, it is highly advantageous that this bucket should not rotate or spin, thus endangering the lives of the shaft-sinkers. To avoid such rotation, a special lay nonspinning rope has been built. This is illustrated in Fig. 4.

A nonspinning wire rope consists of 18 strands of 7 wires each in two layers. The inner layer is composed of 6 strands laid up in left-hand lang-lay about a hemp center. The outer 12 strands are regular right-hand lay. The inner and outer portions of a rope thus constructed oppose each other in their tendency to twist or untwist, with the result that the rope as a whole is inert and evinces no inclination to rotate when an end is hanging free. A nonspinning rope may therefore be used with convenience and safety for operating a bucket in shaft-sinking or for other purposes where a tendency to spin would be undesirable.

Three Properties Are Desirable

The three properties desired in a wire rope are strength, toughness and flexibility. These should exist in well-balanced proportion. The rope must have such strength that it will sustain the load with a reasonable factor of safety; it must have such flexibility as will reduce the bending stresses to a practical minimum; the wires must be of such size as to safely withstand a reasonable reduction in area due to abrasive wear; while they must be tough in order to resist to the very last degree the tendency to crystallize or become brittle, either from severe or repeated bending or from vibrations due to rapid operation. No one of these properties can be developed to the maximum without causing a serious reduction in the value of the others. For instance: The greater the strength of the wires the less will be their toughness and pliability; the greater the flexibility of a certain construction the less its ability to withstand abrasion.

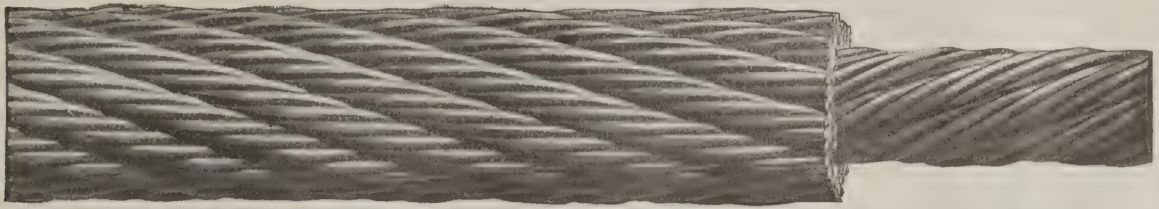

FIG. 4. A NONSPINNING ROPE. A FREE END OF THIS ROPE HAS NO TENDENCY TO REVOLVE OR SPIN

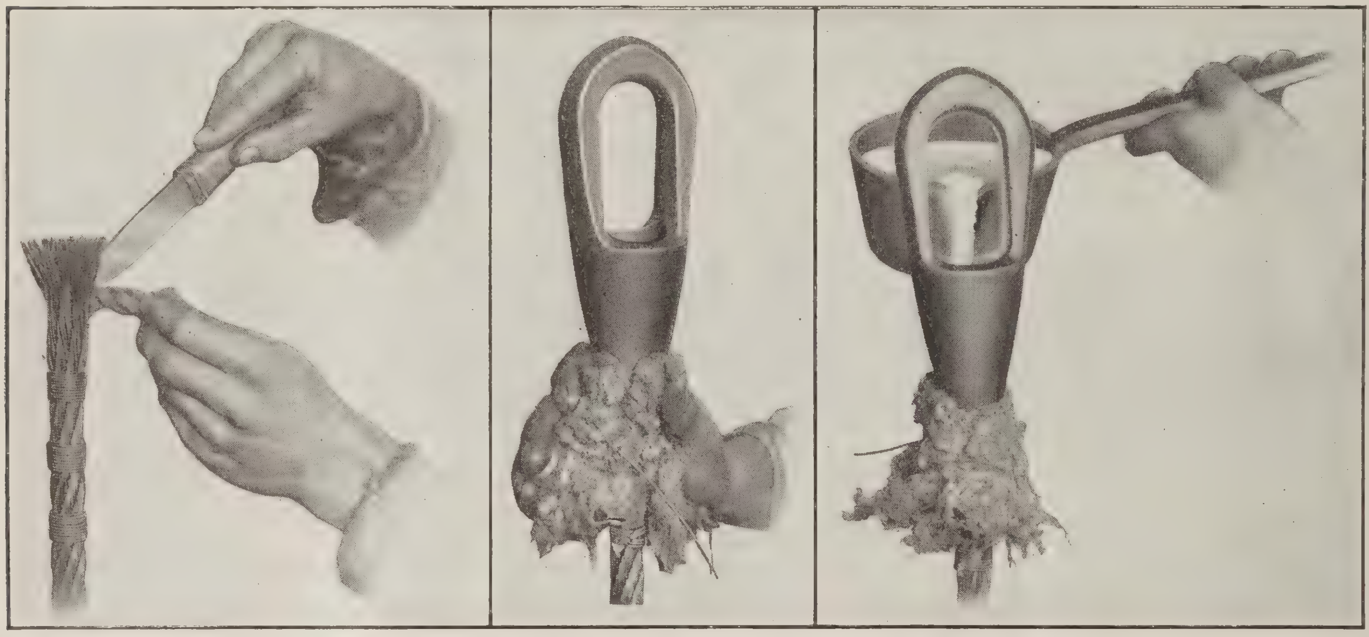
In each and every application of wire rope a careful study must be made to determine which of the before-mentioned factors is of the most importance. The grade and construction of rope which will most nearly fill the existing requirements can then be readily determined.

Many installations of rope-using equipment include sheaves and drums which were provided without thought as to how they would influence the life of the rope. In some instances these conditions are the result of ignorance; in others they arise from a lack of space or power, or the cost of both. Sheaves and drums of generous proportions invariably tend to lengthen the life of the rope.

Some users of wire rope insist upon buying a size and grade which do not insure a sufficient margin of safety. The result is that the rope is continually overstressed, and any sudden overload is apt to produce broken wires or strands, or may even rupture the rope itself. If the machinery will not permit of the use of the proper size of rope, then a grade of increased strength must be resorted to, care being taken to see that such a change—as for instance, from crucible to plow steel—can be made without unduly increasing the tendency of the comparatively stiffer wires to crystallize in service.

Sometimes cases are found where too large a size of rope, both from a standpoint of necessary strength and a limiting size of scoring on sheaves and drums, is used. When a man uses too large a rope he does so principally through ignorance of the essential features of good rope practice or because in his desire to favor the rope from a standpoint of tensile stress he inordinately increases that due to bending. The result is that he nearly always pays more, initially as well as ultimately, for his rope than he would if he had secured the proper size for his purpose.

Ropes should never be unwound by laying the coil or reel flat on the ground and pulling off a single coil at a time. This process puts a certain amount of tension or torsion in every convolution, and consequently the rope will show a greatly increased tendency to twist and kink if dragged or suspended with a free end. If a kink is once pulled into a rope it can never be removed. Furthermore it greatly weakens the rope at that place. Trouble because of improper unwinding is exceedingly hard to locate, although it is encountered quite frequently.



FIGS. 5, 6 AND 7. SHOWING THE THREE STEPS OF SOCKETING A WIRE ROPE

It is necessary in using wire rope to have the proper amount of space between the lead sheave and the drum in order to avoid too sharp an angle. The angle between the line from the center of the sheave to the center of the drum and that from the center of the sheave to the outer side of the drum should not exceed 1½ deg.

Proper Factor of Safety

In all rope calculations it is necessary that the rope under consideration shall have a factor of safety of from 5 to 7. It is customary to calculate the proper working load by dividing the breaking strength of the rope by the safety factor desired and then subtracting from the quotient obtained the net bending stress expressed in tons. A safety factor is just what its name implies, and incidentally it serves partially to provide for the certain loss in strength due to reduction in the size of the wires that have become worn in service. For ordinary work a factor of safety of 5 is sufficient, although if human life is to be dependent upon the safety of the rope, a factor not less than 7 and sometimes as much as 10 may well be employed. There is no practical justification for exceeding these figures.

As the name implies, the bending strain is the strain produced in the wire when the rope is bent around a drum or sheave. The stress is that force which produces the strain. Generally speaking, for ropes 1 in. in diameter and over, it is best to use sheaves and drums of such size that the bending stress will not be more than $^1/_{20}$ of the ultimate strength of the rope. For smaller ropes, an allowable bending stress of from $^1/_{10}$ to $^1/_{15}$ may be considered—preferably the latter.

Since the size of sheaves and drums is generally fixed, we must determine what construction will most nearly bring the bending stress within the desired limit, taking into consideration at the same time the question as to whether or not that construction will stand the combined forces of bending and abrasion better than one in which the bending stress will be relatively greater.

Reverse bending cannot be too strongly condemned. There are a limited number of cases where this reverse bending cannot be avoided, and in such instances the rope has to be sacrificed, but knowing the bad effects resulting from such reverse bending, it is desired to sound a note of warning that should be heeded by all.

The subject of bending stresses is a very abstruse one, on which two authorities rarely agree.

Sudden stresses caused from quickly starting or accelerating the load—that is, those due to inertia—should be minimized, as they increase the tension on the rope beyond all power of calculation. A fairly heavy package can be carried by a light string or cord if the latter is humored, but if the cord is subjected to a sudden stress such as a jerk it will very likely break.

Some operators hoist too heavy loads with their ropes, and some have such high-powered machinery that if the load becomes wedged or meets with an obstruction, the engine power is sufficient to break the rope.

All ropes which operate over sheaves and drums suffer a reduction in area due to abrasion, but very often a slight change in the layout of equipment can be made which will materially reduce this destructive factor. Wire ropes should wind on a drum having a smooth, well-scored or grooved surface, and in the case of haulage ropes, should be prevented from coming in contact with anything which would tend to retard their passage or add to the abrasive wear. Well-turned idlers or rollers should be placed at frequent intervals along the track, to prevent the rope from dragging over the ground ties and rails.

Overwinding Increases Abrasion

Overwinding of a wire rope on a drum greatly increases the wear on the former, especially if the rope is allowed to wind and overwind unevenly. Other evils, the direct result of uneven overwinding, are jamming and mashing of the rope.

All sheaves should be in perfect alignment in order that the rope will not wear unduly in any particular plane. The lead sheave—or in other words, the one over which the rope passes after leaving the drum—should be located far enough away from the latter to permit the rope to wind freely and evenly on the drum. If the space between the lead sheave and drum is too short or if the lead sheave is not in line with the center of the drum, increased abrasive wear will result.

If a wire rope is operated over a sheave or drum which is not properly scored or grooved for the size of the rope, the latter will flatten under the pull of the load. Such flattening tends to rapidly destroy the rope. Drums and sheaves of the proper scoring support the rope at the point where the crushing stress would otherwise produce this flattening.

When ropes are operated where they are subjected to the corrosive action of the elements, the need for proper lubrication and protection from moisture and from acids is doubly great. Sometimes a complaint of poor service is based on the actual tonnage hoisted or the amount of material removed, when it will be developed that the plant using the rope has lain idle for several weeks or months. In such a case, unless the rope is well cared for, corrosion will so weaken it that it will fail almost immediately after resumption of service.

The term crystallization is used to denote the effect produced in wires by continued operation, repeated bending over small sheaves or drums and whipping or vibration of the rope. The place in a rope where crystallization will most likely occur is where it is attached to some rigid object, such as a socket. It is therefore recognized as good practice to resocket all ropes at intervals dependent upon local conditions. What is commonly known as crystallization is in reality nothing more than fatigue of the metal.

Ultimate Failure is Inevitable

The failure or wearing out of a rope is as natural and inevitable as that death must follow life. Doctors can retard human dissolution, and the rope user should know what constitutes good or bad treatment of a rope in order to secure the best of working conditions for his cables and thus prolong their usefulness.

There are several ways of splicing wire ropes, although all of them are identical so far as the fundamental operations are concerned. A well-made splice will often develop the full strength of the rope and be invisible to the eye of even the experienced. The length of rope necessary to make a running splice will vary according to the size of the rope. For instance, at least 16 extra feet should be used for making a splice in a ½-in. diameter rope whereas a 1½-in. diameter rope would require approximately 40 ft.

Proper Socketing Is Highly Important

A socket well attached to a wire rope will more nearly develop the full strength of the latter than any other known type of attachment, as a uniform tension can be secured on each wire of each strand. This is always the factor of greatest importance. Most of the complaints due to breakages at the point of socketing can be traced to carelessness on the part of those who did the work.

The most approved method of applying sockets is as follows: The end of the rope to be socketed should have at least two tightly wrapped servings of soft wire, the last one being at a point about equal to where the rope will enter the basket of the socket. The strands should be opened up, the hemp core cut out, and the wires thoroughly cleaned. Grease may be removed by immersing the wires in gasoline, after which they should be dipped in a dilute solution of muriatic acid (HCl) and then plunged into boiling water containing a small amount of soda, which tends to neutralize the effect of the acid.

The wires may now be inserted into the basket of the socket, care being taken that the socket is in perfect alignment with the axis of the rope. The base of the socket should now be sealed with putty or clay, and spelter (pig zinc) should be slowly poured into the basket of the socket until the latter is filled.

To produce the best results the spelter must not be too hot nor too cold. A simple way to determine the desired temperature is to plunge a soft pine stick into the metal and quickly withdraw it. If the stick is charred, the spelter is too hot; if the spelter adheres to the stick, it is too cold for pouring.

If socketing is done in cold weather the socket should be heated enough to prevent the spelter from solidifying suddenly when brought in contact with its cold surface. Spelter which is too hot has a tendency to anneal the wires of a rope, especially if they be of fairly small size.

Importance of Frequent Lubrication

A wire rope should be lubricated for the same reason that any machinery should—to minimize the friction of its working parts. The lubrication should be so carried out that the rope will be protected from corrosion as well. Most makers thoroughly lubricate not only the wires, but the strands of ropes, in the process of manufacture, and it is imperative that the user of rope keep up the good work.

The strands of a rope have a tendency to force the lubricant out of the center, and unless the user constantly applies some lubricant to the rope internal corrosion will take place even though the wires which are visible remain bright and uncorroded.

In view of the fact that the failure of a wire rope may cause loss of life, as well as damage to property, the importance of thorough internal lubrication cannot be overestimated.

No great help can be expected from the hemp center. While this may have been thoroughly saturated in the beginning, considerable lubricant is soon squeezed out, leaving the rope dependent upon outside lubrication.

The use of a compound which will run easily and drip from the rope, leaving it practically dry after a few days in the hot sun, is to be avoided. There are few if any operations where the ropes are greased every day, nor is there any real necessity for such a practice where a properly selected compound is employed. Consequently, a lubricant should have a certain staying power even at fairly high temperatures.

The fact that a grease is fairly heavy or thick does not necessarily indicate a good lubricant; on the contrary, many such compounds possess no lubricating value whatever. A rope in use is continually subjected not alone to the wear of the drums, sheaves or rollers, but to a constant wear inside, owing to the wires in the strands moving slightly upon each other. The edges of the strands are constantly touching and nicking when the rope bends.

A proper protective shield should form a cover, protecting not only the outside, but also the inside of the rope or cable. It should not form a hollow shell capable of retaining moisture, nor should it harden quickly and flake off. Such a shield should be absolutely impervious to moisture and should remain plastic for a considerable length of time. It should, when applied, be able to penetrate sufficiently to reach the inside wires and to make a homogeneous coating.

* *

Successful Shoveling Machine

By Edward H. Coxe*

SYNOPSIS—This machine, which is built in three standard sizes, shovels the coal from the mine floor and loads it into the mine car. Slight changes in construction adapt the machine to loading coke or other material from stock pile or yard.

The accompanying illustrations show the shoveling machine manufactured by the Myers-Whaley Co., of Knoxville, Tenn. This machine has been on the market for about five years and is the invention of William Whaley, a member of the firm, and is covered by patents issued to him.

Mr. Whaley began working on the design of this apparatus in the early part of 1907, and the first complete machine was put into operation in the spring of 1908 in the mine of the Windrock Coal & Coke Co., working in a coal bed 4½ ft. thick. Here the machine was operated for several months.

This first machine when working with an ample supply of loose coal in front of it loaded at the rate of 1 ton per min., the daily output ranging from 50 to 100 tons, according to the car supply. Adequate facilities were not provided to keep the machine steadily at work, and its use was finally discontinued.

At the present time the machine is built in three standard sizes, as follows: No. 2 type is designed to work in a space as low as 47 in. from the top of the rail to the roof. The principal dimensions are: Weight, about 9000 lb. when in working order; track gage, 18 in. and over; length, 19 to 21 ft., depending on the length of the car employed; width over all, 4 ft. 9 in.; wheelbase, 33½ in.; reach, 7 ft. 9 in. on either side of the center of the track; maximum height over all, 46 in., or more if desired; width of shovel, 27 in.; power consumption, about 7½ hp., a 10-hp. motor being provided; maximum capacity, 30 cu.ft. per min. in loose material.

No. 3 type is designed to work in 5 to 6 ft. of head room. The principal dimensions of this machine are: Weight, about 11,000 lb. in working order; track gage, 20 in. or over; length approximately 22 ft. 6 in., varying to suit car; width over all, 4 ft. 6 in.; height, 3 ft. 11 in.; wheelbase, 35 in.; reach, 8 ft. upon either side of the track center; width of shovel, 29 in.; power consumption, about 10 hp., a 15-hp. motor being provided; maximum capacity, 35 cu.ft. per min. in loose material.

No. 4 type is designed for mines or tunnels 6 ft. and over in height. The principal dimensions are: Weight, about 17,000 lb.; track gage, 24 in. or more; length, 22 to 26 ft., varied to suit car; width over all, 5 ft. 4½ in.; height, 4 ft. 6 in. and upward, depending on height of car; wheelbase, 42 in.; reach, 10 ft. either side of the track center; width of shovel, 34 in.; power consumption, about 12 hp., a 20-hp. motor being provided; capacity, 45 cu.ft. per min. in loose material.

Only One Motor Is Employed

The entire operation of the machine is accomplished by one motor mounted in the space beneath the rear inclined conveyor, the friction clutches and operating levers being all close together so that they may all be handled by one operator in one position.

The motion of the shovel closely resembles that of a man in shoveling. Figs. 1, 2 and 3 are views of a No. 2 type machine at work in a 54-in. coal bed and show different positions of the shovel proper. Fig. 1 shows it going under the coal. In Fig. 2 the shovel is partly up to the dumping position, while in Fig. 3 it is being discharged onto the conveyor. The largest type of machine has a platform mounted on the front swinging frame or jib with a seat for the operator.

The machine may be propelled backward or forward, and a clutch operated by a hand lever connects the conveyor drive and the shovel drive to the motor. This is provided with a spring set at a predetermined tension, so that should the mechanism of the conveyor or shovel encounter a greater load than it is intended to carry, the clutch slips, preventing breakage of the part. The front portion or jib frame of the machine is pivoted to the main frame and swings laterally 45 deg. on either side. This enables the No. 4 type of machine to shovel or to reach material over a total width of 20 ft. from one track.

The shovel proper consists of two parts, and is mounted on the end of the jib frame. The front is supported and driven by a crank rotating continuously in one direction. The sides of this front section extend backward to a cross-shaft having rollers on each end running in cam grooves. The rear, or inner, shovel is mounted on this cross-shaft. It fits between the sides of the front shovel and has ears projecting upward with cam rollers to engage other grooves for tilting the rear shovel.

---

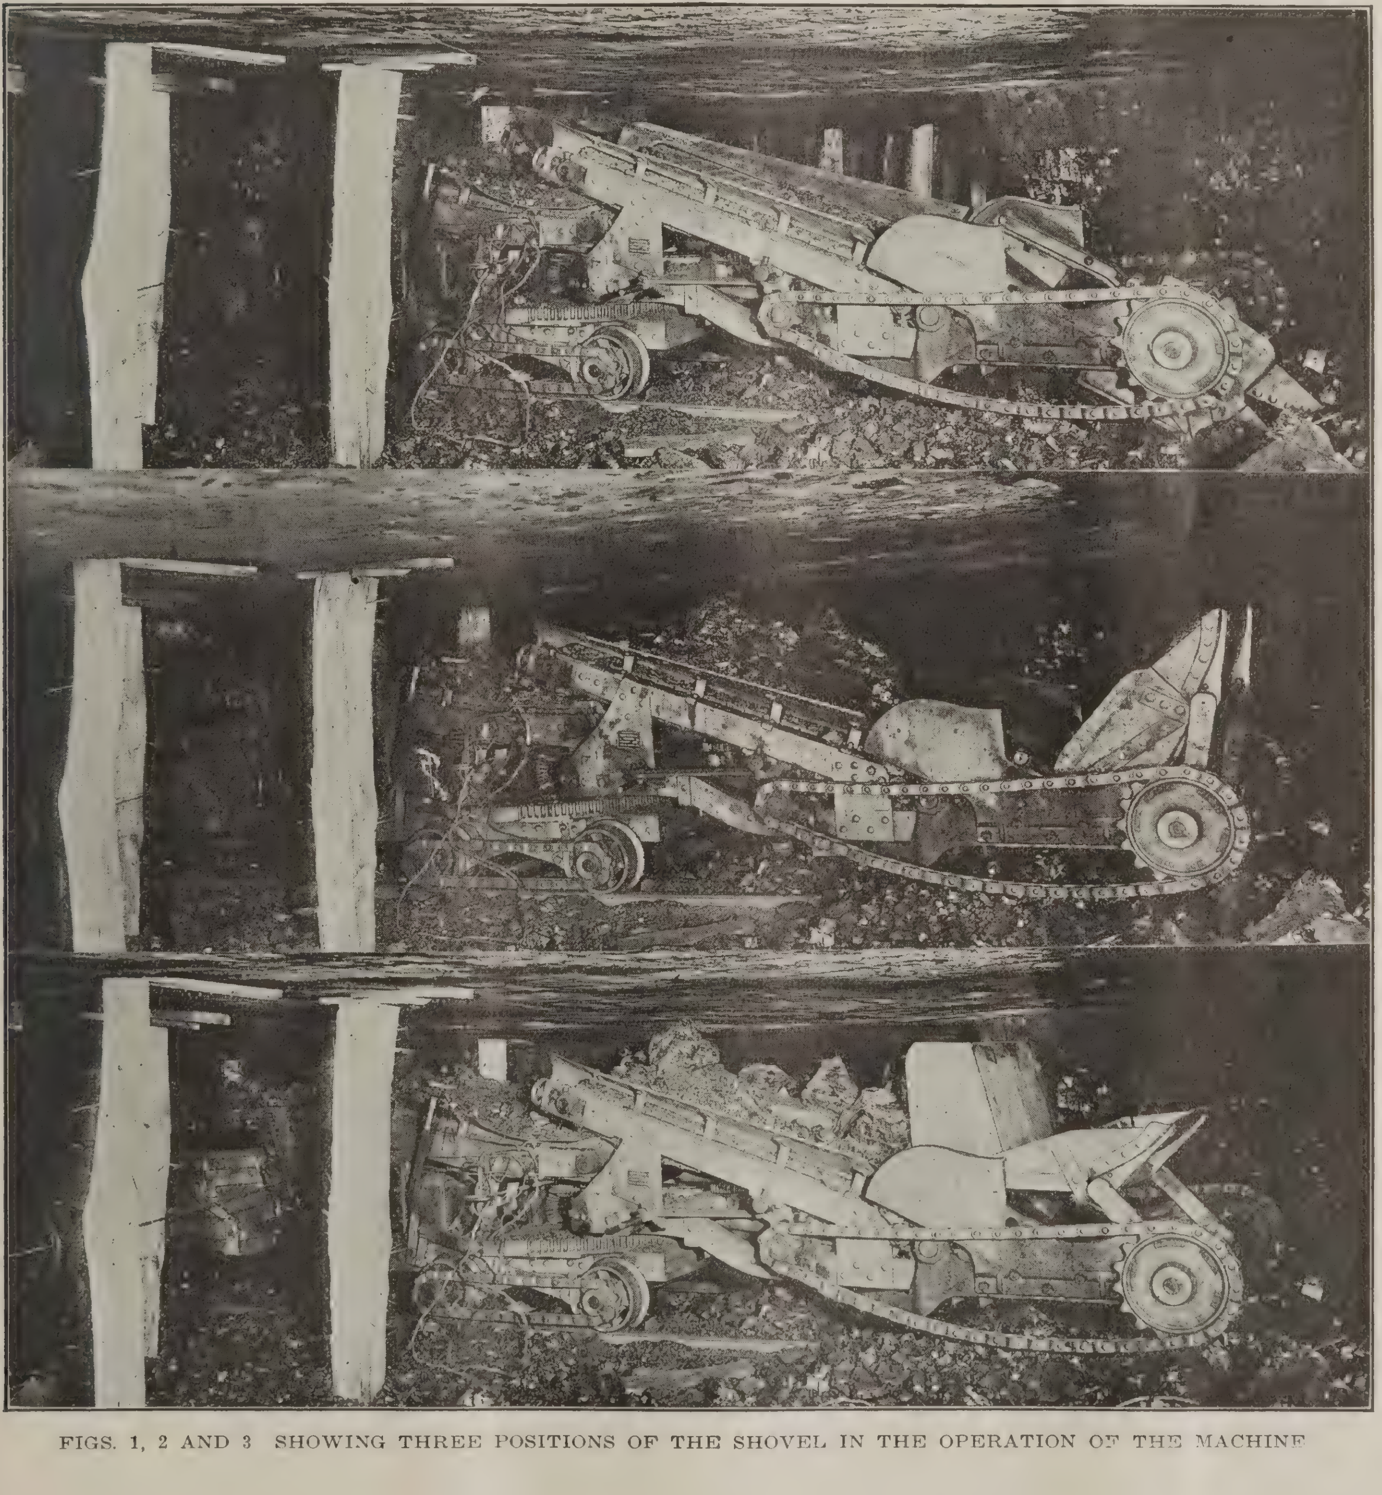
*413 W. Cumberland Ave., Knoxville, Tenn.

The shovel is thrust forward under the material to be handled, then rises up through it, passes backward and opens, discharging the coal onto the inclined conveyor, which swings on the jib. The action of the shovel is continuous and automatic. The only task the operator has to perform is to direct the shovel to the material and start and stop the machine as cars are loaded or places are cleaned up. The inclined conveyor on the jib delivers the material to a second conveyor, which is pivoted at the same point as the jib and which may be swung laterally for loading on either side of the machine or on a curve. This conveyor carries the material backward and delivers it into the car. It will handle lumps or pieces as large as can be delivered by the shovel.

Owing to the efficient shoveling motion, the power consumption is comparatively small, electric meter readings in tunnel work showing that the No. 4 machine consumes approximately $^{22}/_{100}$ kw.-hr. per ton of material handled. The shovel proper on this size of machine weighs about 1000 lb. and is operated at a speed of 13 to 14 strokes per min. It will handle approximately 4 cu.ft. of material per stroke.

The main frame of the machine is a single piece of steel casting, which in the No. 4 size weighs 2200 lb., while in this size of machine there is all told about 8000 lb. of steel casting. The rest of the machine is mostly structural steel shapes and forgings, with a few cast-iron parts.

The transmission gears are all cut and most of them hardened. The bearings as a general rule are of white bronze. The sprockets are all of steel with cut teeth, the



FIGS. 1, 2 AND 3 SHOWING THREE POSITIONS OF THE SHOVEL IN THE OPERATION OF THE MACHINE smaller ones being case-hardened. The drive chains are all of nickel steel of the automobile type of roller chain.

This shoveling machine may be operated by electricity, compressed air, steam or gasoline, and it is adaptable for underground mining in any class of material, tunnel work, open-cut work or loading to or from a stock pile. Certain minor changes may be introduced to suit the material being handled; thus for loading coke the head of the conveyor may be fitted with a screen for removing the dust and breeze before discharging it into the car. In the design for this latter class of work the whole machine may be made to revolve through a circle, the main frame being mounted upon a turntable on the truck, which has a wheelbase of 6 ft.

Machines of this type are now in successful operation in tunnels, in rock, salt, lead ore and limestone mines, in copper-ore pits and in limestone and gypsum stock piles, as well as in coal mines, these being scattered over the states of New York, Pennsylvania, Indiana, Illinois, Missouri and Montana, and also in Spain and South Africa.

The principal problem in the use of the machine is that of transportation or car supply, which in the case of coal mines has not yet been very well taken care of. Coal operators are slow to adopt new ideas or to depart from old and established customs. It is believed, however, that a considerable saving may be made, not only in the reduction in cost of loading itself, but in maintenance and because a given tonnage may be secured from a small area.

⁂

Flag Raising at Exeter Colliery

At the Exeter colliery of the Lehigh Valley Coal Co., a flag was raised on Saturday, July 3, to celebrate Independence Day. As Sunday was the Fourth of July, it was necessary to shift the day either ahead or behind, and July 3 was chosen.

The Westmoreland and Henry collieries decorated the company's offices, and the men of Exeter colliery, with the assistance of the Lehigh Valley Coal Co., furnished a fine entertainment for a big crowd. A large flag measuring 10x18 ft. had been purchased by the employees, and a flagstaff 70 ft. high from which to fly it was provided by the company. The flagstaff is near the site of the Battle of Wyoming, where on July 3, 1778, the tories and Indians, in unholy league, defeated the American militiamen.

The Lehigh Valley Coal Co. also supplied benches and erected a large tent for the convenience of the audience. W. D. Owens, division superintendent of the Lehigh Valley Coal Co., was chairman. The invocation was delivered by Father Quinnian, of St. Cecilia's Church, Exeter Borough. Prof. Brierly, of West Pittston, delivered the principal address, making the flag his theme. Mrs. C. S. Crane, regent of the Dial Rock chapter of the Daughters of the American Revolution, gave the obligation, and Conrad Wildoner, of the Grand Army of the Republic, made the response. Songs were sung by the school children and others under the direction of D. W. Phillips, their voices being accompanied by the Exeter band. The benediction was delivered by Rev. J. A. James.

The women and children were given ice cream and cake, and all present received a book entitled "My Flag" and a small reproduction of that emblem. Such flag raisings are becoming increasingly frequent and give an excellent opportunity for impressing on every one the ideals of freedom, order and fairness on which the republic rests.

FREE IN NATIONALIZATION AS IN CITIZENSHIP

But such flag raisings of late have been generally accompanied with efforts to urge naturalization on foreigners. It is doubtful whether we desire citizens who need any urging. Perhaps we should be as proud as a certain secret society which forbids a canvass for membership. Many associations have learned to their cost that they have only been weakened by such members as were secured by dint of excessive solicitation. We want our citizens to come freely to a free country.

PART OF THE CROWD AT THE FLAG RAISING AT EXETER COLLIERY OF THE LEHIGH VALLEY COAL CO.

VETERANS OF THE GRAND ARMY, WITH COMPANY OFFICIALS

Mrs. C. S. Crane is in the center. The company officers are W. D. Owens, A. H. Browning, R. A. Mulhall, George Miller, J. C. Williams, C. C. Brierly, Richard Culter, David Owens and David Richards. The G. A. R. men include Comrades Shoemaker, Wolf, Nagle, Wildoner, Fetts and Durland

OFFICIALS, OLD EMPLOYEES AND BOY SCOUTS AT THE FLAG RAISING TO CELEBRATE INDEPENDENCE DAY

Our problem is not much different from that of Russia in Poland; Germany in Alsace-Lorraine and East Prussia; Austria in Galicia and Transylvania; England in French Canada, the Transvaal and Egypt. The more we press our language, our ways and nationalities on foreigners the more they resist. We shall and do succeed, despite the difficulties, only by following, like some other nations, the broad and unerring road of tolerance. The work of nationalization proceeds the faster because those we would assimilate came here with a predisposition to believe this country a land of freedom and of large opportunity. We of all people have the least need to force the process of digestion.

But we must not be surprised if foreigners, even from the Balkan states, are not at first enamored of our civilization or anxious for a place as citizens. It is not any more surprising than the fact that the fellaheen of Egypt have but little affection for British rule.

Americanization Not To Be Imposed, but Embraced

But we need not despair. Granting these aliens fellowship and fair treatment, they will not be foreigners long. "Good wine needs no bush," and our American freedom, tolerance and good nature need no advertisement.

But the flinging of the flag to the breeze is the confession of our faith in those ideals on which the nation is founded and of our intention that those purposes of our government shall be perpetuated by our people. The binding force of such teachings will knit together our communities and do much to prevent those unfortunate manifestations of violence and ill-will that have awakened us too often to the fact that all are not Americans who are domiciled in America.

It is for these reasons that flag raisings such as that at Exeter are to be commended. By such exercises our people consecrate themselves to the service of the nation, and it is a pity that in other places this worthy national movement is being mixed with a proselytizing propaganda which cannot effect its purpose.

Don't Blow Into a Cap

It is common practice for miners to blow into fulminate caps when making up primers, in order to blow out any dust, dirt or sawdust which may be therein. This is a bad practice, as the moisture from the breath or small globules of saliva may dampen the end of the powder train in the fuse when it is inserted and cause a cutoff or even a misfire. Neither should the cap be rapped on anything hard to loosen and shake out any dirt. If proper care is taken of the caps they will not need any such cleaning.—*Engineering and Mining Journal.*

Coal Trade's Need of National Co-operation*

By Charles F. Kerchner†

No industry is more in need of coöperation than the coal trade, and the coal trade at this time is more in need of intelligent coöperation than ever before in its history. Why?

Because one definition of coöperation in an industry is given as the equitable distribution of profits among those who earn them, which means that coöperation should insure that there be some profits for distribution. Also because during the past twelve months, owing to the great industrial depression and the adverse business conditions attributed primarily to the European War, no branch of the coal industry acknowledges having received a normal or equitable profit.

The war in Europe seems to have brought on price wars among the trade in many sections of the country. I am considering the subject from the standpoint of the mine operator, the coal carrier, the selling agent or jobber and the retailer of coal, and perhaps the consumer as well. When we think of the vast and varied interests covered by this list, the tremendous work of supplying the fuel needs of this country, and as now seems imminent the requirements of many foreign markets that may depend upon us, the subject seems appalling and much too important to be dealt with except very briefly.

When we consider that the coal areas of the United States are limited, it is evident that in view of our broadening markets, foreign and domestic, we should conserve our coal wealth against crude, wasteful and antiquated merchandising methods. This latter means that every branch of the trade should be safeguarded against cut-throat competition and unfair business practices; that a general and continuous effort be made all along the line to bring about a more even demand and distribution so that periods of great shortage in markets are not followed later by overstocked bins at ruinous prices.

Reducing Number of Sizes

The anthracite companies have been considering during the past year the question of reducing the number of sizes now prepared and sold by them. A decrease in the number of sizes, if it could be managed without disturbing present markets or lessening the demand by the introduction of competing substitutes, would be to the advantage of the mining companies and of some advantage to the retail distributor. I cite this simply as an instance where working together might help solve an important problem.

The necessity of coöperation in the coal trade must have been recognized early in its history. This is evidenced by the many exchanges, associations, clubs and organizations of all kinds that have been projected in the past, also by the many local and state organizations that flourish at the present time. A great number of those are largely composed of retailers and are intended to safeguard the interests principally of the retail distributors of coal. About this time of the year our trade papers devote considerable space to convention proceedings of these associations.

In some of our city coal exchanges the members in utter violation of fundamental business principles are engaged in price-cutting campaigns that must mean serious money loss and sacrifice of capital and credit. These spasmodic outbreaks, usually started by one kicking member, often apparently unsettle or annul the effect of several years of patient organization. Why have these irregular and unsatisfactory conditions prevailed? What is the answer?

Is it a fact, as one writer observed, "that men cannot coöperate successfully for any purpose if the sole bond between them is one of self-interest?" Are we hampered too much by tradition and precedent? Isn't it about time that a manly effort be made to bring these various interests of this great industry together in one strong national organization that will be always and everywhere truly representative; that will be mutually beneficial and protective; that will carry the educational work into every city, town and village in our land; that might be competent to voice the sentiments of the trade as a body on any national or state legislative question that directly or indirectly affects the interests of the trade; that no question would be too large or too complex for the organization to handle while leaving strictly local matters to the state or other local associations?

Is there need in the trade now for such an organization, and isn't this the psychological moment to project it? Your presence here indicates that you believe in the value of organized effort. If so how shall we bring this national association into being? Organize here with charter members, adopt bylaws and begin a recruiting campaign? Or shall we make use of Kokoal, adopting its many valuable features, principal among them being its social and fraternal ideas? If the latter are joined with some serious object that would appeal to the material interest of the various branches of the trade, we will have an ideal organization that will command the universal support and respect of our trade members.

---

*Address delivered before the Order Kokoal, Auditorium Hotel, Chicago, Ill., July 13, 1915.

⁂

Coke Demand from Italy

According to advices received by the Chamber of Commerce of the United States from Charles F. Hauss, president of the American Chamber of Commerce in Milan, there is an opportunity because of war conditions for the United States to acquire coke and iron business in Italy. The demand for this metallurgical foundry coke and pig iron appears to be urgent.

Mr. Hauss informs the national chamber that war between Italy and Germany has stopped entirely the arrival of foundry coke and low-grade pig iron from Germany. The local producers, which are the Solvay process works at Vado and Savona near Genoa, are closed because they have no coal, and until the war is over very little coal and coke will come from England, from which Italy has been importing about 70,000 tons of coke per year. The imports from Germany, Austria and Belgium amounted to 220,000 tons of coke per year.

"If the present feeling can be depended upon," Mr. Hauss informs the national chamber, "Italy will probably never purchase from Germany again, or if she does, it will be after a long time, so that America never had a better opportunity to get and hold the coke and iron business in Italy. We therefore cabled that there is a great demand for metallurgical foundry coke and pig iron and requested that you wire prices."

Mr. Hauss suggests to prospective senders that the date should be given at which sailing can be had. The unloading and handling charges to put the goods on cars at Genoa or Savona would be about 50c. a ton, and the freight from these ports to Milan is just under $2 a ton. The port of Savona has special facilities for unloading coal and coke, so that this would be the best port to which to ship.

The metallurgical or hard foundry coke, which has come from Westfalia in the past, was delivered in Milan at from $11 to $12 a ton, and at the present those who have any coke in stock are getting anywhere from $20 upward a ton.

The committee on transportation of the Milan chamber is studying the matter of finding return cargoes for American steamers and has in view besides the colored and Carrara marble, zinc and lead hematite, and iron ore from the island of Sardinia. There is naturally the usual higher grade freight for alimentary products as well as wine, cheese and silk. Such an arrangement would tend to reduce the freight rates and at the same time build up a substantial business between the United States and Italy.

Furthermore the financial committee of the Milan chamber is at work on an arrangement between the banks in Italy and in the United States which would advance money on bills of lading, thus avoiding the disagreeable demand for payment in advance.

European Financial Interests in South America

That Great Britain's financial interests in South America have been of material assistance in smoothing the way for her export coal trade has been generally accepted. It is not, however, as widely known by what scale these interests are measured.

At the end of 1912 it was estimated that Great Britain had £724,623,743 invested in South America. While the German figures are not available, there is no doubt their tremendous increase in shipments from 13⅓ million tons in 1903 to 43½ million tons in 1913 was due in a measure to the same reason. The course for America to pursue is plain.

Decrease in Anthracite Shipments

Shipments of anthracite during the first half of this year were 1,350,485 tons less than those during the first six months of 1914. Shipments last month were 814,084 tons less than those of June a year ago. The figures for June were 5,316,102 tons this year and 6,130,186 tons in 1914, and the total figures for the six months were 31,595,304 tons this year as against 32,945,789 tons in 1914. The amount of coal on hand at tidewater shipping ports decreased 11,888 tons, from 751,617 tons on May 31 to 739,729 tons on June 30.

The Lehigh Valley led in tonnage for the month with 988,253, the Lackawanna was second with 888,399 and the Philadelphia & Reading was third with 852,411. The Delaware & Hudson carried 697,894 tons, the Erie 693,089 tons, the Jersey Central 609,127 tons, the Pennsylvania 446,690 tons and the New York, Ontario & Western 140,239 tons.

Extracts from a Superintendent's Diary

Today a moving-picture film-producing company came into camp and took temporary possession of everything in sight—men, women, children, mules, scenery, equipment and all. For some time we have had one or more idle days in each week, and I decided last Monday when the manager of the film company came for an interview that no reasonable objection could be raised against turning over the mine to his company on the next idle day, so today's adventures were the result.

We staged a mine fire, an explosion and a strike in rapid succession, and if circumstances had not interfered, would have enacted a murder trial in which four striking miners were to have received death sentences, largely because some of their companions had insisted on telling what they knew when put on the stand to testify.

We were supposed to furnish only the scenery and the mob—the camera, the scenario, the stars and the director being provided for in advance; but as a matter of fact we inspired so many changes in the scenario that its author wont be able to recognize it when he sees the film; and as for the stars, the star of the entire performance was Sim Hicks, organizer and leader of the last strike at our camp, while Sadie McDonald, his sweetheart, earned favorable mention to say the least.

The strike as conceived by the author of the scenario was minutely described and could have been enacted down to the smallest detail, but his kind of a strike never has existed anywhere outside of the minds of some people who, like the author of the scenario, receive their impressions from newspapers or novels; and Sim Hicks, standing back with the "supers" as the instructions were being read, felt called upon to go up to the director and tell him how the thing ought to go.

Fortunately the leading man of the company realized that Sim knew whereof he spoke, and a few moments later he also realized that Sim could take the lead; and what was more to the point, he had Sim leading before Sim realized just what was up.

Another thing that Sim accomplished without realizing it, was the clearing up for some of us of many mysteries connected with our last strike, so completely did he become wrapped up in the spirit of the drama.

Sadie McDonald was assigned a minor part, which as it happened proved most fortunate for the success of the picture, because Sadie also became wrapped up in the drama; but her infatuation was not with the spirit of the drama, but with the worldly spirits by which it was being enacted.

The realistic manner in which the two actresses who were supposed to be rivals for Sim's love caressed him every time they had half a chance was too much for Sadie; and in the last scene, when Sim is supposed to make a choice and advanced with open arms to receive the lucky fair one, Sadie lost control of her emotions and would have spoiled the entire film had it not been for the presence of mind of the director, who managed to make Sadie's unexpected advent into the center of action appear as if she were really part of the program, being none other than a third rival for the hand of our handsome strike leader.

All in all, before the film was finished Sim, Sadie and all of us had a day of it that we will not soon forget.

Middle Western Anthracite Market Dull

Efforts to stimulate anthracite orders are still being made in the Middle West, but it is doubtful if a reduction of $1 per ton would result in increased buying. Anthracite shippers on the Upper-Lake docks still have considerable empty space in their yards; but the independent shippers, not having storage facilities, have been cutting prices to move their current output, while the dealers complain that they cannot accept the volume of shipments of other years because of the meager demand for storage coal this summer. They are working on a hand-to-mouth basis until return of cold weather, when they expect an extraordinary activity.

At points in Illinois, Iowa and Nebraska current shipments have been made at discounts of from 35c. to 50c., which are the lowest prices for a number of years past. July is usually considered a dull anthracite month in the West.

Situation at Upper-Lake Docks

The movement of coal off Lake docks has been unusually slow this season. Receipts up to June 10 as compared with those up to June 1, 1914, were: Soft coal, 1,065,000 tons, against 1,308,000; hard coal, 344,000 tons, against 130,500.

More hard coal has been shipped this year than last season, while the tonnage of soft coal shipped to the head of the Lakes is considerably less than last year. Approximately the docks had in stock Apr. 1 this year 3,275,000 tons of soft coal and 482,000 tons of hard coal. This, with the shipments of the present season, shows coal on docks to be 4,340,000 tons of soft coal and 1,826,000 tons of hard coal, or a total of 6,166,000 tons, less the shipments moved since Apr. 1, which are smaller than ever before.

Most of the tonnage carried over was what may be termed for railroad use, and as a result of the bountiful crops in prospect the railroads undoubtedly will requisition heavily on supplies from the docks in the near future. Normally they consume 3,500,000 tons of dock coal. The dock companies have always figured on the trade taking a reasonable amount of its requirements during spring and the early summer months, but for two years the trade has waited until the coal was actually needed, which has added to the complications of the dock situation.

Annual Meet of American Mine Safety Association

By authority of the executive committee the annual meeting of the American Mine Safety Association for election of officers and transaction of business will be held in Birmingham, Ala., Sept. 2, 3 and 4, 1915. There will be the usual joint interstate miners' field meet, and the Bureau of Mines, the Alabama Safety Association and the American Red Cross will act in conjunction in promoting this event, which will be known as the Third Annual Southern States Miners' Field Meet.

Headquarters will be at the Hilman Hotel, and the sessions of the association, beginning at 1 p.m., Sept. 2, will be held in the rooms of the Chamber of Commerce. The executive committee is notified to meet at this place at 10 a.m., Sept. 2. Chairmen of all committees are requested to prepare and submit their annual reports and their recommendations regarding changes in standards or practices.

The largest possible attendance is urged, both because of the importance of the business to come before the association and the fact that the field meet will result in the selection of a team to represent the Southern States at the National Miners' Contest, San Francisco, Sept. 23 and 24.

Fuel Used by New York Gas and Electric Companies

The gas and electric companies operating in New York City consumed 2,684,839 tons of coal and coke during 1914, according to reports filed with the Public Service Commission. Of this total the gas companies used 1,579,122 tons of coal and coke, and the electric companies used 87,548 tons of anthracite and 1,018,169 tons of bituminous. The reports also show that three of the gas companies made 533,474 tons of coke and sold 271,539 tons.

The tonnages used by the various companies are given in the accompanying tables.

COAL CONSUMED BY ELECTRIC COMPANIES IN 1914 (TONS)

	Anthracite	Bituminous
New York Edison Co.	8,066	686,973
United Electric Co.	......	113,027
New York & Queens Electric & Power Co.	23,816	8,220

Exposition Prizes Awarded

The preliminary list of awards by the Panama-Pacific International Exposition gives the Department of the Interior's collective exhibit one grand prize. The exhibit of the Geological Survey receives one grand prize, four medals of honor, five gold medals, six silver and two bronze medals. The Bureau of Mines receives one grand prize, six medals of honor, three gold medals and three silver medals.

Bunkering at San Francisco

The only large bunker contract in San Francisco is the Pacific Mail Steamship Co.'s contract, filled by the Western Fuel Co. All regular steamship lines that touch San Francisco, if engaged in the coastwise trade, burn oil; those in the ocean trade that burn coal usually touch at Puget Sound or Vancouver Island and bunker there. At the end of 1914 there was brisk bunkering on account of tramp steamers arriving in San Francisco to take grain cargoes to England. The price for bunkering coal is around $6.75 to $7.25 f.o.b. vessel, for mine-run coal. The coal is loaded from wooden hulks or barges fitted with special machinery for bunkering vessels, and they are brought alongside the vessel for that purpose.

Economy of Motor Trucks for Delivering Coal

By J. F. Flood*

In the fall of 1912 the Youghiogheny Coal Co., of Pittsburgh, Penn., purchased two 6-ton Peerless trucks and commenced operating them. These gave such complete satisfaction that they bought two 5-ton trucks on Oct. 7, 1913. The depreciation charges against these trucks, plus net earnings, equal an amount, as of Dec. 31, 1914, that is $3200.81 in excess of their cost, all expenses of operation, plus depreciation, being charged to the trucks. The company has figures to show what it costs per ton to haul coal by means of horses, the coal delivered by trucks being charged at the same rate as team delivery. The fact that the depreciation charges, plus net earnings, exceed the cost of trucks by more than $3000 is conclusive proof that their investment in trucks has been a profitable one.

Two of the trucks used by this company are of 5-ton capacity, but the average load in 1914 was 6.005 tons. During that year each of these trucks averaged a total actual running time of 320 days of 10 hr. each, exclusive of the time it took the trucks to run from the garage to the yard and return.

These four trucks have covered more than 80,000 miles, carrying heavy loads up many of the steep grades of Pittsburgh and have never been stalled for want of power.

---

*General manager, Youghiogheny Coal Co., Pittsburgh, Penn.

Recent Legal Decisions

Missouri's Mine Ventilation Law—The statutory duty of Missouri coal operators to provide suitable ventilation for miners at work does not prevent an operator from devolving the duty of cutting openings upon miners whose skill and experience qualify them to do the work. And an operator is not liable for injury to a miner resulting from poisonous gases and lack of opening between two rooms if the injury followed the miner's disobedience of an order given him by his foreman to make an opening. (Kansas City Court of Appeals, Perry vs. Northwestern Coal & Mining Co., 175 Southwestern Reporter 140.)

Delivery of Coal on Private Tracks—Where carload shipments of coal were consigned for delivery to the consignee on his private switch track leading to his coal-sheds, the delivering railway company was not entitled to payment of the freight charges nor could demurrage charges accrue until the cars were placed on that track. Putting the cars on public delivery tracks at the point of destination and notifying the consignee of their arrival was insufficient tender of delivery. (Massachusetts Supreme Judicial Court, New York, New Haven & Hartford R.R. Co. vs. Porter, 108 Northeastern Reporter 499.)

Royalties and Forfeitures Under Coal Leases—When a coal lease provides for mining various sizes of coal at differing royalties and for payment of minimum royalties, but fails to provide what proportion of small sizes shall constitute the minimum quantity to be mined annually by the lessee, it will be enforced according to any practical construction that may be for a long time mutually adopted by the parties. A clause authorizing the lessor to declare a forfeiture of the lease on the lessee's failure for more than 90 days to pay royalties after they have become due will not justify a forfeiture for delay in paying a small amount if the lessee's liability for that amount was reasonably in doubt during the period of the delay in payment. (Pennsylvania Supreme Court, Lehigh Valley R. Co. vs. Searle and Stark Heirs, 94 Atlantic Reporter, 74.)

Ballads of a Coal Miner--III

By Berton Braley

Today when we gets through
My pardner says, says he,
"Come on, let's hist a few—
The drinks'll be on me."
But I says, "Thank you, bo,
I'm on the water cart,
I'll have to answer, No,
Right here an' at the start.

"This time, of course, *you'd* buy
But next wud be *my* turn
An' drinks comes much too high
Fer me, with what I earn.
Besides, frum what I've seen,
Booze treats you mighty rough,
An' I ain't very keen
To monkey with the stuff.

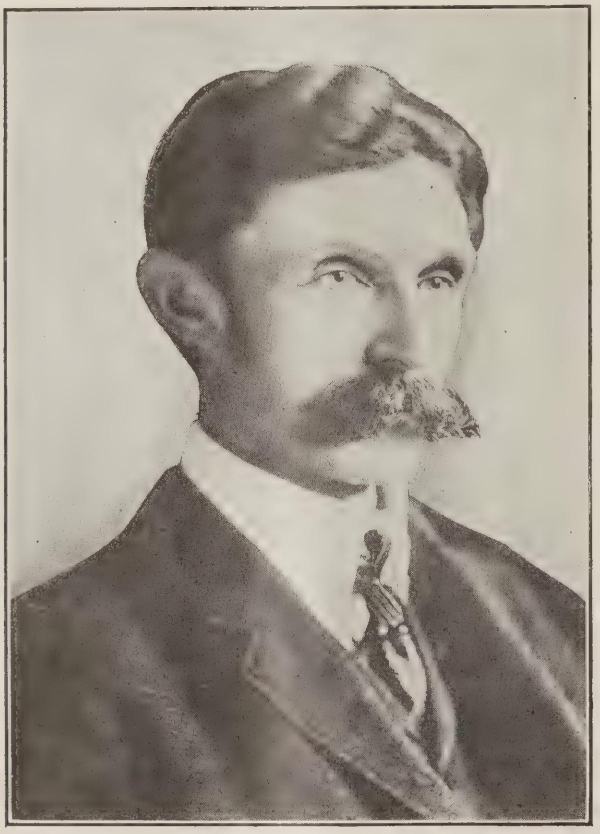
"I've seen guys blow their kale,
Get drunk an' row an' fight,
I've seen 'em land in jail
Or sleep on floors all night,
I've seen 'em come on shift
All shaky-like an' gray,
An' so—you get my drift—
I think it doesn't pay.

"There's chance enough to take
When I'm in sober trim,
Without no booze to make
My senses dull an' dim.
I guess I'll blow my chink
For grub an' clothes an' shoes;
Some guys prefer to drink,
But I'll keep off the booze!"

The Death of Doctor Holmes

Word has been received that Dr. Joseph A. Holmes, director of the United States Bureau of Mines, died in Denver, Colo., on July 12. For a number of months Doctor Holmes' strength has been gradually failing him. All his efforts to regain his health through changes of climate and by securing the best of medical advice were unavailing.

It is the belief of many of the friends of Doctor Holmes that his untimely end was hastened by the unusual efforts and the long hours he devoted to the establishment and operation of the Federal mining bureau. Doctor Holmes was the first director of this comparatively new mining department of the Government, and it is to him principally that credit must be given for the excellent organization that has been established.



JOSEPH AUSTIN HOLMES

Coal Age has already published a short sketch of the life of Doctor Holmes, but a few words at the present moment are of interest.

He was educated at Cornell University, graduating from that institution in 1880. After leaving college his attention was largely devoted to geology, chemistry and mining. He visited mining regions in this and many foreign countries, examining both metal mines and coal operations. From 1881 to 1891 he served as professor of geology in the University of North Carolina. From 1891 to 1903 he acted as state geologist for North Carolina. In 1903-4 he organized and had charge of the Department of Mines and Metallurgy at the World's Fair, St. Louis.

His first real work for the Government commenced in 1904, when he was placed in charge of important fuel tests then being conducted. In 1905 the director of the United States Geological Survey enlarged the scope of Doctor Holmes' work, so that his investigations covered mine explosions and other important phases of general mining work. From 1905 to 1910 this mining work was carried on by Doctor Holmes under the direct supervision of the Geological Survey. It was in 1910 that the new mining bureau was first established, with Doctor Holmes as its first head.

Joseph A. Holmes was a member of the American Institute of Mining Engineers, the Mining and Metallurgical Society of America and a number of other similar organizations. He was possessed of one predominant quality—tact—which served him well in the difficult task he undertook of popularizing the new Federal mining bureau among the coal- and metal-mining fraternity of America. Many men believed that the Government had neither reason nor right to enter actively into the business of mining, even on a coöperative and nonproductive basis, and it became the duty of Doctor Holmes to satisfy these men that the Bureau of Mines was organized solely as an advisory department and not as a bureau of interference and dictation.

The national recognition that has been accorded this branch of the Government service constitutes the greatest compliment that the mining industry of America can contribute to the memory of a man all have loved for his common virtues and respected for his work as an organizer and engineer.

⁂

New Safety Precautions

The Susquehanna Coal Co. has just completed examining its mine foremen, assistant mine foremen, fire bosses and safety inspectors in the anthracite-mine law. Many of these men have been in the employ of the company for long periods and passed their state examinations many years ago. The management of the company wanted to make sure that they were conversant with the mine law as it is today, and the results have been most gratifying.

The series of examinations was started in all five divisions of the Susquehanna Coal Co. last fall. Certain pages of mine law were assigned as the subject-matter for each examination, and the employees who occupy the responsible positions were given three months to prepare for the first test. In a division that reported recently, only three men scored less than 100 per cent.

The examinations are given by the division superintendents and are written. They are modeled upon a system of periodic examination such as is conducted in schools of like nature. The examinations are held on days when the colliery is idle, or at night, and the entire mine law germane to their duties is covered in the series. Such a series of systematic tests can be carried out by any company, large or small. The interest and study shown by the employees have proved highly satisfactory to both officials and men.

⁂

As Pressure Increases with Depth in mining, so will the tendency to lessen the proportion of large coal. This is clearly recognized, and the way in which it may be moderated is by laying out the workings in the manner most suitable for the cleavages, also by the method of undercutting and packing and by avoiding downhill faces in seams with much dip. It is further held to be especially desirable to work at a uniform rate with just sufficient pressure to help in bringing down the coal. Stopping the workings for a time is known to be detrimental.

The Labor Situation

SYNOPSIS—It is possible that there will be no anthracite strike next spring. A Pennsylvania court refuses to grant an injunction against the union. The condition of labor in Ohio is desperate and little bettered by the ending of the strike. Miners strike in the eastern Kentucky field for a restoration of the former wage scale. The Bache-Denman Coal Co. learns that it cannot get damages for mines destroyed. In Colorado attempt is being made to remove Lawson's judge.

On June 8 the canvass of the United Mine Workers of America for new members started in the anthracite region, with President John P. White as principal spokesman. In his speeches he urged the strengthening of the union in order that an 8-hr. day might be established and the union recognized. These are apparently to be the main aims of the anthracite workers in the coming struggle. If these ends alone are sought, the strike is quite likely to meet public approval and to end in complete success.

The 8-hr. day may not be strongly opposed by the operators; for it is probable that the day workers, who are the only persons really concerned, can easily increase their efficiency so much that in the shorter day a larger output may be produced. It is impossible to disguise the fact that in the anthracite region there has been some "slacking," as our English cousins call it. Even with shorter hours a larger stint of work could be performed; for in one state, Illinois, where the 8-hr. day obtains nearly five times as much coal is handled by the outside force as in the anthracite region. This is shown to be true when making the calculation, even when we exclude in favor of the anthracite region all the slate pickers in that field.

Very cleverly Mr. White at Scranton said: "Let us be consistent; when we demand that the operators recognize our union, let us recognize it ourselves and join it." This pronouncement is the keynote of the canvass.

A Rumor That Some Operators Favor the Check-Off

There is a rumor started that some of the companies are willing to grant the check-off and full recognition of the union. Of course, this is spread to bring the men into line, but it has probably some basis in truth. Certain of the larger companies do appear to be favorable to some means of preventing button strikes and think the check-off a cure, because the man who desires to quit paying has to declare his intention openly, whereas now he can simply be slack.

The 10-per cent. increase demanded will not be obtained in practice by the daymen if the hours are shortened more than the wage is increased, which is what they desire and demand. Consequently it is likely that the increase will be granted, the men promising to make up the shortness of the working day by greater diligence when at work.

The daymen failing to get an increase in day wage and having their working hours reduced only to that which is already customary with contract miners—who often work even less—the contract miners may be well content to waive their demand for increased pay. If they want a higher return they can readily increase their output of coal. So considering everything, it seems likely at present that the much-heralded anthracite strike may end in a love feast.

The mine managers and operators in the anthracite region are in a class by themselves. If perhaps a somewhat un-American degree of aloofness characterizes them, there is also a marked tendency toward paternalism or socialism, whichever one may choose to term it; and if the miners enter into their schemes, it is quite likely that the latter will find the operators ready to make an arrangement which will benefit the workingmen in many ways. In fact there is a large amount of fine idealism in the anthracite operator upon which the coal miner can well work to the mutual advantage of both.

Perhaps the conciliation board will be removed and replaced by boards like those already established elsewhere. They have not brought peace any more than the anthracite conciliation board, but they are probably as successful in doing so as the board now in control in the anthracite region will ever be. The miners always will, it is to be presumed, prefer to strike than to arbitrate, and they will find a way, like the operators, to avoid the fines proposed. The miner always terms the strike a "holiday" and the operator explains a lockout as a "shortage of orders" or of railroad cars.

Some New Decisions of the Conciliation Board

The conciliation board has decided that the employees of the Bear Valley colliery of the Philadelphia & Reading Coal & Iron Co. are entitled to yardage pay when cutting pillar-hole headings where foremen or assistants order the work done. The pillar-hole headings are what in the bituminous regions would be termed rib crosscuts.

The Harwood Coal Co. dispute was not decided as the board was unable under the evidence to determine what the former practices have been, and the mine committee and the officials of the company have been instructed to meet and ascertain the conditions under which certain rates were formerly paid.

The Clinton colliery workers declared to the board that the Delaware & Hudson Co. had discharged certain pillar men out of spite and not, as claimed, solely to reduce the force employed. This grievance was withdrawn on the reinstatement of the men.

The engineers and pumpmen of the Valley Coal Co. and Coxe Brothers & Co. desired the board to decide against the practice of those companies, which was alleged to be to lay off the regular engineers and pumpmen when times were dull and replace them with assistant mine foremen and firebosses. This matter was referred to the umpire for adjustment, as was also the case of the Tunnel Ridge colliery against the Philadelphia & Reading Coal & Iron Co.

Two other grievances were withdrawn. Thus of 8 disputes 2 were decided for the miners, 2 were withdrawn, 3 were referred to the umpire and 1 was returned to the company and men for further consideration.

Charles P. Neill, of New York, formerly United States Commissioner of Labor, has been named by Judge Joseph P. Buffington of the Third Federal Judicial District Court as umpire to adjust the 20 grievances from the anthracite coal mines in which the conciliation board is unable to agree.

"Thin-Vein" Coal Is Coal North of a Given Line

In the Pittsburgh region the Washington County Court has refused to enjoin the officers of District No. 5 of the United Mine Workers of America from inducing the members of the union to cease work for the Youghiogheny-Pittsburgh Coal Co. The ground of the petition filed by that company was set forth at length in this department of "Coal Age" in the issue of June 19. The court decided that the plaintiff clearly failed to show satisfactory evidence that it was entitled under the 1914 wage scale to employ miners at the rate which it had been paying them. Hence the plaintiff's bill for an injunction against the union officers was dismissed at the cost of the plaintiff.

The company held that the imaginary boundary line between the thick and thin veins of coal known as the "Cedar Creek, Lock No. 4 and Waynesburg and Washington railroad" line was not in contemplation by the parties when they used the words "thin vein" and "thick vein." The court held that if some other division than that named in a previous agreement was contemplated, then as the agreement is made in reference to all the mines in the district, it is void everywhere because of its uncertainty. Consequently an inquiry would have to be made for each individual mine to determine whether wages should be paid on the "thin-vein" or "thick-vein" scale. Further, the court was unable to determine from the evidence before it the exact number of feet of coal required to bring the mine under classification as "thick vein" within the meaning of the persons who executed the scale agreement of 1914.

Sunday Creek Co. Shuts Down More Mines in Ohio

In the Hocking district of Ohio, John H. Winder, general manager of the Sunday Creek Co., announced that the two San Toy mines, located on the Baltimore & Ohio R.R., were closed down indefinitely July 6. Now that these are shut down the Sunday Creek Co. is only operating three mines in Ohio, and they are on the Toledo & Ohio Central R.R. Just how long they will continue working is a matter of conjecture, but it is believed it will not be long unless the demand for Ohio coal greatly improves.

All in all, the coal-mining situation in the Buckeye State is in bad shape. Only about 33⅓ per cent. of normal output from all of the fields of the state is reported, and the percentage is gradually growing smaller.

Vigorous steps are being taken by Ohio operators to right these conditions. One of these has been to form a strong operators' association to include all fields of the Buckeye State. In former years the operators in Ohio have not been organized, and they have not been able to show a united front. Another step is to endeavor to secure relief from the discriminatory freight rates. Since the General Assembly refused to take action last winter a movement has been started to induce the Ohio Utilities Commission to lower intrastate rates. The commission has the authority, as is shown by the decision of the Ohio Supreme Court in the case of the New York Coal Co. against the Hocking Valley Ry. Co. As a result of this suit the freight rate from Nelsonville to Toledo was reduced from $1 to 85c.

Hocking Valley operators and miners are both urging Governor Willis to come to the rescue of the coal trade in Ohio. Both sides now appear to be united on that matter. It is understood that the Utilities Commission is favorably inclined toward the reduction of Ohio freight rates on the zone basis. But as one of the commissioners expressed it, "What is to prevent the railroads from reducing their rates from West Virginia and Kentucky to lake ports and from renewing in that way their discrimination against the Ohio operators?"

It is pointed out that when the railroad companies were interested in Ohio mining there was not as much discrimination in rates as at present. Lately the railroads have become interested in the development of the West Virginia coal fields, and the rates have been reduced from the fields of West Virginia and Kentucky to such a point as to make it impossible for Ohio operators to compete.

It is argued that coal is shipped from West Virginia, Tennessee, Kentucky and even portions of Virginia to lake ports for 2 mills per ton per mile. Ohio operators would be perfectly satisfied with a rate twice as large and could then compete with the producers in the states named.

So far, the officials of the Ohio miners' organization have not answered the communication of John H. Winder, of the Sunday Creek Co., in which he requested the same working conditions that were granted the operators in eastern Ohio. The Sunday Creek Co. has devised a plan of weighing coal under the antiscreen act, which tends to make the miners produce a clean product. The coal is screened over the regulation 1¼-in. screen, picking tables are provided and all dirty coal is thrown out. All the coal is then weighed together, free from the dirt.

A Paper Mining Scale That Helps No One

The new scale is hardly the cause for the closing down of the Hocking Valley mines, for it is if anything more favorable to the operator than the old. Nor is the shutdown due to the greater advantage gained by the Belmont County operators in their escape from unfavorable deadwork allowances, for Belmont County is also running slack where the mines are not still idle. The trouble is in the general business depression in Ohio and elsewhere and in the competition resulting from a more extensive reduction in the wage scale elsewhere. The result is also a climax of conditions which have been growing from year to year and which were inevitable though well-disguised by the relative prosperity of 1913.

The situation in eastern Ohio is quite desperate. There are 5000 men idle, and though there are resumptions at some places, they are far less frequent than was anticipated when the long strike came to an end. And in Perry County, in the Crooksville field, the conditions are very bad. The Tropic Mining Co., through George M. Jones, its president, has addressed a letter to its employees opening thus:

> Has it ever occurred to you that it is possible to have a paper mining scale—one that means a high rate of wages but no work, thereby destroying earning power? The present mining scale, together with the Green mine-run law, has destroyed the coal industry in Ohio. In June, 1913, our Tropic mine, located at Tropic, Perry County, Ohio, worked 21½ days, and the payroll was $19,642.55. In June, 1914, our mine was idle as the wage scale was not adjusted. In the month just passed, owing to the mining scale being too high to enable us to compete with other districts, we could not operate, and the payroll was $457.05. The difference in payrolls, as shown, represents the loss to our employees, as West Virginia and Kentucky coal was used to supply our trade.

Petition will not be made for a referendum on the Gallagher bill. The United Mine Workers of America has decided not to circulate it as the cost would be too great, the need for it is but little and the funds of the union are at a low ebb.

A Strike for Restoration of Old Scale in Eastern Kentucky

On July 1 the miners employed by the Continental Coal Corporation, operating large mines in the Straight Creek field of Kentucky near Pineville, struck. On July 6 the miners employed by the Trosper Coal Co. in the Brush Creek field, near Trosper, Ky., and those employed by the New Bell Jellico Coal Co., near Four Mile, in the Greasy Creek field, went on strike. About 1500 men are involved in the three fields.

About three months ago, owing to the depressed condition of the coal market, the men were asked to take a reduction in wages and were told that as soon as conditions became such that the companies could afford it they would have the old rates restored. The men thought that this restoration should date from July 1, and for that reason walked out. The mines in eastern Kentucky are working from one-third to one-half time on a restricted output, and the demand is the smallest known for this season of the year.

The reduction of wages in nonunion fields in times of depression is a standing invitation for an invasion of the union because by such means the market is taken away from union mines and the men deprived of the percentage they were enjoying. Such an invasion, with the union as weakened as it is now, is not likely to take place at present. But it is always well to maintain rates in bad times and let the nonunion mines take their medicine with the others. But having consented to a reduction in wage rates in March when the winter business still continued, it seems the height of folly for the miners to look for a rise in rates in July—the dullest part of the year.

To Whom Must We Look for Redress if Tipples Are Burned?

The suit for $1,250,000 brought by the Bache-Denman Coal Co. against more than 200 officers and members of the United Mine Workers of America was dismissed by the United States District Court on July 6. This suit, it will be remembered, was for damages incurred by the plaintiff during a strike at its mines. On July 17, 1914, three mines were destroyed; on the 18th, another mine was burned, and on the 20th, a fifth was maliciously fired. Federal troops were called out and peace was restored; and the company, driven into bankruptcy, brought suit against its tormentors. The court now declares it has no jurisdiction. It is a distressing case of a failure of justice. Someone should be made to pay for the flagrant use of firearms and the torch.

Further Developments in the Case of John R. Lawson

Meetings are being held everywhere to obtain liberty for John R. Lawson, the executive board member of the U. M. W. of A., found guilty of murder. Meantime legal steps are being taken to disposses the judge, Granby Hillyer, who condemned both Lawson and Zancanelli. Application was made to the Supreme Court of Colorado through the miners' attorneys, A. M. Belcher, of West Virginia, and H. N. Hawkins, of Denver, Colo., and an alternative writ of prohibition was awarded against the judge.

On July 12 argument was begun on the motion to prohibit Judge Hillyer from participating further in the trial of the so-called strike cases. He is alleged to be in sympathy with the Colorado Fuel & Iron Co. and to have been formerly an attorney for that corporation.

On the same day Judge Hillyer refused to give J. R. Lawson another trial. F. W. Clark, representing Lawson, was given 60 days in which to file a bill of exceptions and a 30-day stay of execution. The counsel desired the court to order that the prisoner be released on bond till the Supreme Court gave its decision, but this the court refused to do. A juror, Grover Hall, has sworn that he was induced to decide against the defendant by undue conduct on the part of a court bailiff.

James H. Brewster, who investigated the strike conditions for the state and testified before the Federal Industrial Relations Commission at Washington, has not been reappointed at the University of Colorado. He has been a bitter partison of the miners' interest. He has written a letter to his former associates at the University of Michigan declaring that he has been ousted for his political action.

COMING MEETINGS

The Southern Appalachian Coal Operators' Association will hold its semiannual meeting July 23, 1915, at Knoxville, Tenn. J. T. McCoy, Knoxville, Tenn., secretary.

The American Mine Safety Association will hold a meeting July 23-24, at Billings, Mont. H. M. Wilson, 40th and Butler St., Pittsburgh, Penn., secretary.

The United First-Aid Corps of the 4th district, Delaware, Lackawanna & Western R.R. Co.'s coal department, will hold its third annual first-aid contest at Harveys Lake, Penn., on Aug. 14, 1915. Lewis Richards, 212 East Green St., Nanticoke, Penn., secretary.

The Somerset County Miners' First-Aid Meet will be held at Boswell, Penn., Sept. 4. The head of the local committee is F. W. Cunningham, Somerset, Penn.

The American Mining Congress will hold its 18th annual session at the Exposition Memorial Auditorium, San Francisco, Calif., Sept. 20-22, 1915. J. F. Callbreath, Majestic Bldg., Denver, Colo., secretary.

Editorials

The Trend of Conditions on New Contracts

In New England the important purchasers during the past month were the Bay State Street Ry., the New Haven R.R. and the International Paper Co. Of the 155,000 tons on which the Bay State Street Ry. (No. 802, Vol. 7, pp. 1005, 1085, 1128) invited bids, 95,000 tons, it is understood, was awarded to the Consolidation Coal Co. on Jenner coal (Somerset County, Pennsylvania) for delivery to the line points Quincy, Lynn and Chelsea, Mass., and Newport and Portsmouth, R.I., and 61,000 tons to the New England Coal & Coke Co. on New River for delivery at Beverly and at Mystic Wharf, Boston.

It is nothing new for this company to draw a share of its fuel from Pennsylvania districts, but the fact that the proportion awarded this year is so large is fresh evidence of the active competition on the part of shippers of Pennsylvania grades in this market. Somerset County coal had the preference among three grades, low-volatile being required on account of smoke laws in certain of the places.

As was generally predicted, the 250,000-ton order of the New Haven R.R. (Vol. 7, p. 1088) for engine fuel at different points and, through the Connecticut Co., another of 150,000 tons were both given to the New England Coal & Coke Co. So far as reported, the invitations did not get to shippers generally, and it is only a matter of conjecture what quality and price were embodied in the successful bid.

The 80,000 tons or so of the International Paper Co. (No. 236, Vol. 7, p. 1083) is for delivery at Portland to be railed inland, and it is reported that this order has been closed as usual with New River shippers at a price about on a level with a year ago. The Penobscot Chemical Fiber Co., taking about 30,000 tons at Bangor, has awarded its contract to the Spring Coal Co., Boston, also on a basis about the same as in 1914. These two orders disclose a determination on the part of West Virginia factors to hold their tonnage for the same figures as in other years.

The National Soldiers' Home, Randolph, Me., contract (No. 699, Vol. 7, pp. 877, 1087) shows the trend of low prices even on small business, particularly bituminous, the Gorman-Leonard Coal Co. having been the successful bidder at $3.69 alongside, 30 miles or so up the Kennebec River.

Most of the contracts awarded so far this year by the various New York City departments have been at lower prices than in 1914. An instance of this is obtained from the bids on the Board of Education contract calling for 84,160 gross tons of anthracite coal and 4700 gross tons of semi-bituminous coal (No. 674, Vol. 7, pp. 836, 976, and 956; Vol. 8, p. 78). The prices in Manhattan Borough were from 28 to 33c. per ton lower than in 1914. The total amount of coal used by the city departments in 1914 was 576,198 tons, and reductions in the price of the fuel used by all the many departments, if equal to those already secured, would reduce the coal bills nearly $150,000.

One of the public service corporations in Chicago is out of the market for screenings until Aug. 1, and its buyer frankly states that he expects to have things his own way. This concern being a large consumer of fine coal, its failure to make purchases at this time is having a depressing effect on the current prices of screenings. No doubt the increasing production of domestic sizes, particularly in southern Illinois, largely accounts for the decline in the prices of fine coal. The softening is somewhat premature and was not expected to materialize until the middle of August. The volume of consignment screenings, however, is small, and there is no disposition to forward fine coal from the mines without specific orders.

No improvement has developed in the volume of business handled over the lake routes. There is a congestion at the upper lake ports, but prices for lake delivery are well maintained despite the depression. More West Virginia coal is moving via the lakes to Northwestern points than Ohio tonnage, which is very slow in getting under way.

⁂

Bunkering Supplies of the World

The United States Department of Commerce and Labor estimated that 75,000,000 tons of coal was consumed per annum for bunkering purposes, and it would seem that this estimate was too low as applied to 1913. The *Iron and Coal Trade Review* (London, England) made the same estimate in 1912. D. A. Thomas later estimated that about 60,000,000 tons of British coal was used as bunker fuel in the foreign trade. Adding 8,000,000 tons to this, covering the bunker coal from this country, leaves only 7,000,000 tons for the rest of the world.

Bunker coal supplied by other countries is about as follows: Germany, France and Holland 2,000,000 tons altogether; Austria and Natal about 2,000,000 tons each; India 1,000,000; Japan 3,000,000 tons. This brings the gross bunkering tonnage for the world up to 78,000,000. In addition to this a large part of the output of China and Chile is used for bunkering purposes, while New Zealand, Canada and Russia are also factors that must be considered.

It is interesting to note that there are about 300 more or less important steamship coaling ports in the various countries of the world. Great Britain has six ports alone that supply over 1,000,000 tons of coal per year for this trade.

British coals are used chiefly on the eastern Atlantic and East Coast of South America, but the more important West Indies stations use United States coal. Port Said, Suez and Aden use the British coal mostly. On the coast of India and Ceylon, which includes Karachi, Bombay, Colombo, Madras, Calcutta and Rangoon, coal from Natal, India and Sumatra supplies the bunkers.

At Singapore and along the coast of Burma, large amounts of Japanese and Indian coal are used, as well as Australian and some Welsh and Natal coal. The Australian stations of course use their own coal mostly, and the same applies to New Zealand. Japanese coal is an important competitor in the East Indies, as it is also further north in the Pacific, although considerable quantities of Chinese, Australian and Welsh coal are also found in these markets. A peculiar condition is that scarcely no United States coal is used for bunkering on the West Coast of South America, the supply coming almost entirely from Great Britain, Australia or Chile. Even along the North American Pacific Coast a great part of the bunkering coal is from Australia or British Columbia.

⁂

Selecting Workmen and Machines

The problem of coal production is an intricate one. There was a time when the man who successfully operated a mine was, or at least was supposed to be, primarily a geologist. Times have changed, and today many coal producers with long records of success behind them may be unable to distinguish a Paleozoic from a Mesozoic formation. These men, however, know and know well how to handle the two factors upon which success or failure in mining chiefly depends. These factors are men and machines.

Leaders of men are born, not made. The ability to successfully direct the efforts of other people is as truly a natural gift as is music. While each may be trained and developed to a greater or less degree in different individuals the foundation of natural and inborn aptitude must be present in the beginning if marked success is to be attained.

The direction of human effort is a problem decidedly different from the selection and manipulation of machinery. The personal equation of each man—his temperament, inclination, likes and dislikes—varies decidedly from that of his neighbor. Nature does not deal in duplicates nor does she follow modern methods of manufacture so far as interchangeability is concerned.

On the other hand, man in his efforts at creation and invention aims almost invariably at "quantity production." Each separate part and individual element entering into a certain machine or mechanism is made, within certain well-defined and predetermined limitations, a duplicate of like parts or elements entering into the construction of the same or similar machines. Furthermore, the quality and size of parts are tested, tried and maintained by frequent analyses, physical tests and gagings, so that the quality and adaptability of the parts for the purpose in hand are at all times definitely known.

This care exercised in the manufacture of many of the articles employed in and about the coal mines is well exemplified in the description of the processes employed in the making of wire rope appearing on page 84. As a result of the constant care and strict supervision employed in its manufacture the maker of rope knows within an extremely small margin when his product leaves his mill what weight it will lift, what size of sheave it may pass around without excessive wear, and many other considerations of benefit to the user if he would secure the best service possible for the money he is about to invest.

Wire rope is only one of many mechanical devices indispensable to the operation of a modern coal mine. It may, however, be taken as a good example of mechanical apparatus, the failure of which may not only seriously disturb the equilibrium of the working organization, but may also endanger human life.

If a hoisting rope, for example, is not selected with due regard to the load it will be required to handle; if the sheaves over which it travels are not of the proper diameter; if the engine drum is too small or is improperly grooved, or if the rope is not adequately and periodically lubricated and treated with a suitable compound to shield it from the corrosive action of the elements and mine gases, the result will be inevitable, and only the time needed to accomplish the rope's failure will be uncertain.

Coal mining today is a dual proposition, success depending one-half on the efficiency and morale of the working force and one-half on the efficiency and reliability of the mechanical equipment and power supply. There is therefore quite as much room for the exercise of good mechanical engineering in the selection, care, maintenance and operation of the inanimate equipment as for so-called "human engineering" in the selection, organization and manipulation of the workmen employed.

⁂

Market Abuses by Retailers

Coal shippers have been discussing recently a sales feature which is not entirely satisfactory from their standpoint. In a number of Western cities local dealers having retail yards not only sell coal in wagon-loads from their bins, but also do a jobbing business in carload shipments, and the wholesale shippers complain that they are competing with them on carload business.

On the other hand, the retailers are most insistent through the medium of their organizations, formed for their protection, that the operator and wholesaler shall ship coal only to regular members of these associations in good standing and shall protect the retailers from what they term the illegitimate sale of coal in carload lots direct to the consumer or to parties that have no yard facilities. This position on the part of retailers is acknowledged to be correct by the wholesalers.

The question has now been asked why the producers and wholesale shippers should not be protected against this form of competition on the part of retailers. It is felt that the sale of coal in carload lots to manufacturers and consumers who have sidetrack facilities and do not buy coal in wagon lots should be strictly confined to wholesale shippers, if the retail yards are to continue to have the protection that has been thrown around them in the past by the wholesalers.

The operators assert that it is a poor rule that does not work both ways, and several of them have expressed themselves forcibly to the effect that the practice of the retailers in selling coal in carload lots has had a most detrimental result in creating unnecessary competition and causing unwarranted price reductions. The wholesalers take the position that if they protect the retailers by not shipping direct to their customers the retailers should keep their hands off the carload business and give wholesalers and operators exclusive control of that trade.

Discussion By Readers

Value of Coal Analyses

Letter No. 3—I read with interest Mr. Coupland's reply to my inquiry on this subject, *Coal Age,* June 26, p. 1111. I find that while he agrees with me in some respects, he regards a few of my statements as "manifestly unfair."

The rate of $4 or even $6 named by Mr. Coupland for making a complete coal analysis is certainly reasonable; and I freely admit that, with this low rate, more coal consumers should analyze their coal, especially when they are using large quantities of fuel. The small consumer, however, could hardly afford to pay even this low price for an analysis of the product. My idea of the prices charged for this work was formed from my experience several years ago, when I assisted a prominent engineer who charged $25 for making such analyses. I wrongly assumed that the present price ranged around that figure.

However, I am still firm in the belief that coal-testing methods can be improved. As previously stated, I think it is only logical that the coal operator should test his shipments, which I am pleased to learn from Mr. Coupland's letter is being done by many uptodate mines today. I would ask, then, Why is it necessary that another test should be made by the purchaser of the shipments from such mines? It is customary for manufacturers of food products to advertise their goods as being 90, 95, or 99.5 per cent. pure, and the public buy these goods without questioning the truth of the claim. Occasionally such products are tested by the Government, and also, it may be, by some large buyers. Such a method is surely more satisfactory to all concerned than for the buyer to duplicate the work of the manufacturer, which would increase the cost to the consumer.

I can see no good reason why the mine operator should not be compelled to state the amount of moisture, volatile matter, carbon, ash, etc., contained in the coal of each shipment. The results of such an analysis could then be tacked onto each car shipped or on each barge loaded. Had this been done in the case of the 600-ton barge of coal mentioned by Mr. Coupland, there is no question in my mind but that the reported analysis would have shown the correct percentage of ash contained in the coal, and the sugar refinery would not have purchased that coal with this information before them. I do not believe that there would have been any attempt at deception, and I do not assume that there was any attempt on the part of the coal operator to deceive the purchaser of that coal. The coal did not meet their requirements and was rejected, but had this information been furnished with the bill of lading the loss of time and annoyance would have been avoided.

Under the present arrangement I do not blame mine operators for shipping coal without special regard in most cases for its quality, leaving that question largely to the purchasers to discover for themselves. As previously stated, I believe that there should be a change in this regard. A change would have an advantage in that small buyers would get just as good coal as is secured by the larger consumers who are able to test every shipment of coal. My contention is that a declaration of the fuel value of each shipment should be made by the coal operator. Such a declaration would certainly be fair to all parties, and would properly inform the consumer of the quality of his purchase.

N. G. NEAR.

New York City.

⁂

The Purchase of Coal

Letter No. 1—I was interested and somewhat amused in reading the article entitled "The Purchase of Coal," *Coal Age,* May 8, p. 800, to note the many statements that, to say the least, are misleading.

At the beginning of the article, the author presents two questions which he admits "may seem odd," but which he claims bring forward "intensely practical answers." These questions are, "Why does the consumer purchase coal?" and, "How does the consumer purchase coal?" He answers the first question by stating that "coal is bought for heating purposes." This question is indeed odd and altogether unnecessary. The consumer purchases coal because he needs it and cannot get it without buying it in the market. Coal is not always bought for "heating purposes." It may be required for the manufacture of gas or coke or used in other industrial ways. I would suggest a more rational question would have been to ask, For what purpose does the consumer purchase coal?

In answer to the second question, I would say that coal is purchased either on a specification basis or at a fixed price per ton for a particular kind of coal. The author's reference to the purchaser of coal being "forced by current practice to buy tons of coal, regardless of the true value to him," and the statement that he is "paying for mere weight of coal," and his suggestion that, "there is more involved in the purchase (of coal) than mere tonnage," seem needless. As a fact, the consumer is not forced to buy his coal "regardless of the true value to him." He is always in a position to insist upon a certain heating value per ton.

Buying coal without specification does not necessarily mean that the purchaser is paying for mere weight of coal. If one buys Quemahoning coal from a reputable concern that mines and sells Quemahoning coal, he is reasonably sure to get that coal, with possibly some variation in heating value, but of a certain standard. If one buys Colver coal from the company mining that coal, he is certain to get nothing else; if one buys Castner, Curran and Bullitt New River coal, he is equally sure to get that coal. All of these coals have a certain minimum heating value, as the general consumer knows from experience. In other words, every large purchaser of coal knows about what results he should get from a given coal, and buying coal on its name, at a fixed price per ton, without any further guarantee as to its heating value, is not so much going it blind, as intimated by the writer of the article.

All locomotive fuel in this country and by far the greater part of the coal consumed in stationary plants and that for marine use are bought on the name and the reputation established as a result of many tests and long-continued use. There are other items that affect the purchase of coal besides its heating value. For railroad use, especially, the questions of transportation and certain financial considerations enter into the problem of the purchase of coal. It is not always the coal having the highest heating value that is the most economical fuel for a given plant; the price is an important factor, also the behavior of the coal in the furnace.

When it is possible to use successfully Illinois washed screenings, at $2.30 per ton, with a heating value of 12,200 B.t.u., the question may be asked, Would it be wise to buy New River coal at $3.30 per ton, having a heating value of 14,900 B.t.u.? Many steam plants have been purposely altered so that they could burn coal having a low heating value and thereby reduce the cost of operation. It is the cost of efficient operation that must finally control the selection and purchase of coal for fuel purposes. The problem is to secure the highest plant efficiency at the least outlay for fuel, and this involves the question of a suitable furnace.

The diagrams presented in the article to which I have referred as illustrating graphically "how one pound of coal may have great significance when all costs and efficiency in the plant are considered" are misleading, because they do not take into consideration the different varieties of coal and the difference in character and composition of the volatile matter.

The statement that "the content of fixed carbon and volatile matter is a measure of the productive cost" is not always true, assuming that by "productive cost" is meant the heating value of the coal per unit price. Coal, for the same percentage of combustible (fixed carbon and volatile matter), may have wholly different heat values. Thus, a coal having certain percentages of combustible and ash may have a lower heating value than one with a less percentage of combustible and more ash. As proof of this statement compare the following actual analyses of five different coals:

1. Combustible, 95.69%; ash, 4.31%; 14,272 B.t.u.
2. Combustible, 93.98%; ash, 6.12%; 14,841 B.t.u.
3. Combustible, 94.23%; ash, 5.77%; 14,283 B.t.u.
4. Combustible, 94.20%; ash, 5.80%; 14,820 B.t.u.
5. Combustible, 94.07%; ash, 5.93%; 14,549 B.t.u.

It is wrong to assume that the volatile matter of coal is wholly combustible and that the percentage of ash represents all the incombustible matter. The first two coals mentioned contain respectively 7.98 per cent. and 1.59 per cent. of oxygen, which being combined, is as nonproductive an element as the ash. This does not seem to have been considered in preparing these diagrams. The author admits that the first diagram represents "a purely hypothetical coal not found in nature"; but claims that the other four diagrams "are representative of coals on the market and show a common range of characteristics." I do not think that coals containing 24 and 32 per cent. of ash are at all representative or that their characteristics are at all common. I would like to ask if anyone can name a soft coal, offered on the market as steam coal, that would show so much ash. It is needless to state that diagram No. 2, representing a coal with 8 per cent. ash, shows better results than the three following diagrams where the ash runs 16, 24 and 32 per cent. respectively.

Again, the statement that "it is generally conceded that coal high in ash and sulphur is harder on all handling apparatus than a coal of lower ash and sulphur content," is not always true. For instance, a coal with 4 per cent. of ash that fused readily and made a soft, sticky clinker would certainly prove more injurious to the grate and furnace walls than a coal having 8 per cent. ash and a high fusing point, which would yield a light, porous clinker that is easily removed. It does not follow, either, that a coal with 1.5 per cent. sulphur would be more injurious than a coal with 0.75 per cent.

In fuel consumption, the heat available to the boilers and not the "evolution of heat in the furnace" is the controlling factor. Also, the evolution of heat in boiler furnaces will not always "vary directly with the heat content of the coal used."

Again, it must be remembered that a low consumption of a comparatively high-priced coal will often result in a higher cost of operation than a larger consumption of a cheaper coal. The coal best adapted to the conditions of the plant and load may not be the highest grade of coal, the purchase of which the writer of the article seems to advocate. For example, New River coal would not be the best adapted for use in a furnace designed to burn Illinois screenings, although the former is certainly a high grade of coal. Cost and adaptation are the vital factors in determining what coal should be used.

It may be possible to operate a plant with a high degree of efficiency when burning a coal of comparatively poor quality, provided it can be obtained at a low cost and meets the required conditions. The author does not state what he means by "daily tests" or "weekly averages," the results of which he suggests the consumer should send to his dealer, thinking thereby to place "both parties to the contract on an equitable footing." It is not clear what is intended by this suggestion.

In regard to the character of the tests to be made, if the coal is bought on a specification basis, the test will depend on such specifications. But when coal is bought otherwise, it is not necessary to determine the heat value for the same character or kind of coal, but only its ash content. For instance, if a Pocohontas coal is being used, any variation in ash will cause a corresponding variation in heat value, and a determination of the former is all that is required. Unless the coal is to be used for some special purpose, it is also unnecessary to determine the sulphur content. One important item that the author has failed to mention is the fusing point of the ash. In practice, high heat value will not be available if the coal clinkers badly. Sulphur is not a true measure of the liability of a coal to clinker, unless the nature and distribution of the sulphur compounds are known, and even then it would be somewhat of a guess.

At a well-managed steam plant, boiler tests are generally thought to be necessary. The determination of fixed carbon and volatile matter are practically unimportant, except when called for by specification or where there is a smoke ordinance in force. While the calorimeter test is simple enough in principle, the actual performance of the test is far from simple and requires much care and skill on the part of the attendant.

The article does not mention the important question of getting representative samples when testing a shipment of coal. The closing statement that "uniform fuel means uniform and economical operation" is untrue, since it is quite possible to have a uniform grade of coal and a high cost of operation, owing to poor firing or bad condition of furnace and other like causes of waste.

The subject of the purchase of coal is too large to be treated in a short article, and most general statements relating to methods and requirements are subject to modification in one way or another. The fact that so many complications enter into the purchase of coal on the market has led many large consumers to go back to the old way of buying coal by weight and reputation. It has also caused many coal operators to refuse to sell coal on analysis, except at a higher price. The United States Government, one of the largest consumers and one of the first to buy coal on an analysis basis, has made numerous changes in its specifications and has not yet reached an entirely satisfactory basis.

The American Society for Testing Materials has had a committee working on standard coal specifications since 1909. This committee was composed of representatives of the largest consumers and miners of coal, as well as prominent engineers. The committee has as yet been unable to make a final report owing to differences of opinion and practice. For this reason it is well to make only carefully guarded statements on this subject.

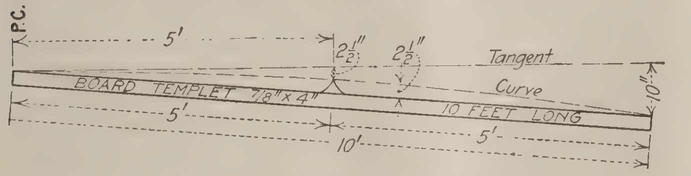
Laying in a Mine Track Curve

Referring to the reply to the inquiry of Ostel Bullock, Coal Age, June 12, p. 1036, permit me to describe a method of laying in such a curve that has been used with good success. It is as follows:

A straight-edge 10 ft. long and 3 or 4 in. wide is made from ⅞-in. good dressed pine. At the center on one edge of this strip is constructed a projection having a height equal to the middle ordinate of a 10-ft. chord of the curve it is desired to lay out. For a 60-ft. radius, the middle ordinate of a 10-ft. chord is 2½ in. For a 100-ft. radius curve, which is used more frequently than curves of 60 ft. radius, the middle ordinate of a 10-ft. chord is 1½ in. The middle ordinate of a chord is always one-fourth of the tangent deflection for that chord. Hence, the middle ordinate o of any chord c for any radius R may be calculated by the formula



$$o = \frac{c^2}{8R}$$

Assuming that the PC point of the curve has been located on the center line of the entry, which is the point where the curve begins, the first step is to locate a point on the curve 5 ft. distant from the PC point by measuring an offset from the center line of the entry. This offset is equal to the middle ordinate of the 10-ft. chord, which in this case is 2½ in.

Now, having located the first point on the curve 5 ft. from the PC point, lay the straight-edge on the floor of the entry in such a position that one end corresponds to the PC point and the top of the projection at the middle of the template corresponds to the 5-ft. point just located. The other end of the straight-edge will now indicate a second point on the curve, 5 ft. beyond the first point, the straight-edge itself corresponding to a 10-ft. chord.

The template is now moved forward 5 ft. and when one end is made to correspond with the first 5-ft. point of the curve and the top of the middle projection corresponds to the second 5-ft. point on the curve, the other end of the template will indicate a third point on the curve 5 ft. distant from the second point.

By thus repeating the process, the entire curve is run, the accuracy of the work depending on the care taken in establishing each successive point. If a transit is available, it is of course much better to locate points on the curve by its use in the ordinary way, deflecting the proper angle from the tangent for the longest chord that permits a clear sight in the entry. When this is done, intermediate points can be established by the use of the template as described. However, when a transit is not available, the entire curve can be laid in with an error not exceeding a few inches if care is taken in performing the work.

Curtisville, Penn.

Mining Laws and Legislation

Letter No. 5—That the bituminous mining laws of Pennsylvania are inefficient in the power they confer on the mine inspector to enforce the provisions made for the safeguarding of life was very vividly and emphatically demonstrated in the explosion at the No. 3 mine of the Smokeless Coal Co., at Ferndale, a suburb of Johnstown, in the latter part of May, 1915, when nine lives were sacrificed to a vagary.

An examination of the mine after the explosion, by a committee of four mine inspectors, revealed the fact stated in their report that the explosion was caused by a shot fired in a live entry, which released a pocket of gas and caused an initial explosion that, assisted by the coal dust present, was extended so as to cover a large section of the mine and reached the ventilating machinery on the surface.

In this case, the coroner's jury returned a verdict that the victims met their death under the circumstances stated, which were made possible by the failure of the officials of the company to follow the suggestion of the district mine inspector and install safety lamps in that part of the mine. It seems to me that the jury did not return a just verdict in the placing of the blame. It would have been just as consistent for them, under the circumstances, to have returned a verdict placing the guilt upon the mine inspector for not enforcing his suggestion.

Under art. 10, sec. 1, of the bituminous mine law, the inspector can exercise discretionary powers in enforcing the installation of safety lamps wherever explosive gas can be detected by an approved safety lamp, while under art. 28, sec. 2, his discretionary powers are revoked as not applying "to any mine wherein explosive gas is being generated only in live entries." In the discussion of mining laws and legislation, in Letter No. 36, Coal Age, Mar. 6, p. 433, a writer called attention to this discrepancy and contradiction in the law and pointed out the danger of the defect in just such a case as the one quoted here, citing as an illustration the Cincinnati mine disaster that occured Apr. 23, 1913.

The present mining law has now been operative for a period of four years, and the executive officers of the state have undoubtedly been aware of the existence of this clause restricting their authority in the enforcement of proper safety provisions and the danger necessarily arising from such restriction. Why then, it may be asked, have they not made some attempt to have this legal defect removed? They are the men who are held responsible for the enforcement of the law and to a strict accountability for the accidents occurring in their several districts; and it seems to me that they are the men who should see to it that the law is explicit and comprehensive enough to be enforced when such enforcement becomes a matter of necessity. There seems to be something radically wrong on the part of some one when a law that permits lives to be put in jeopardy is allowed to remain operative, while no effort is made for its annulment.

The primary object of law is to secure the greater safety of lives and property, but here is a proviso that tends to defeat that object. If the mine inspectors will not take any active measures to have this section repealed, then the mine officials, together with the miners themselves, should take active measures for its abolition. The present case is an instance where the inspector's duty was restricted to a suggestion and the officials' compliance was optional. Both parties, in pursuing the course they did, were within the law; and I would ask, Why is it claimed that the operators were at fault? Would not a more just verdict, in this case, have stated that the nine victims were legally murdered, since their death resulted in full compliance with the law?

The suggestion of the inspectors' committee was simply a synopsis of the legal provisions for safety and contained no reference to the dangerous and objectionable section to which I have referred, either as to its existence, revision or elimination.

In closing permit me to offer a suggestion that appeals to me as worthy of the careful consideration of mining men in general and of legislators in particular. The suggestion is that as a safety precaution boreholes be kept not less than 3 ft. in advance of all holes drilled to fire a blast, on both ribs in all solid workings, whether the mine be gaseous or nongaseous.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

Effect of Pressure on Fusion—Pressure acts to oppose increase of volume. Some substances, as water, for example, expand when passing from the liquid to the solid state and an increase of pressure therefore **lowers the freezing point** of such substances. The decrease of atmospheric pressure at high altitudes facilitates the formation of ice, though to a less degree than other more potent causes.

On the other hand, some substances, as wax, contract when solidifying, and an increase of pressure then acts to **raise the freezing point** or point of solidifying. In other words, an increase of pressure acts to assist the melting of wax and similar substances, while it retards that of ice.

Melting Points of Substances—The melting point of substances depends largely on their purity and treatment. For this reason different authorities often give different values for the same substance. The following table gives the approximate melting points and the heat of fusion, in British thermal units per pound, for the substances named:

MELTING POINTS AND HEATS OF FUSION OF SUBSTANCES

Substance	Melting Point, Deg. Fahr.	Heat of Fusion, B.t.u. per Lb.
Aluminum	1211	138.6
Beeswax	148	76.1
Copper	1980	77.4
Gold	1947	....
Ice	32	144.0
Iron, cast (white)	2000	41.4
Iron, cast (gray)	2400	59.4
Iron, wrought	2820	....
Lead	620	9.0
Nickle	2600	8.3
Platinum	3100	48.6
Silver	1764	37.9
Spermaceti	120	66.5
Steel	2462	36.0
Sulphur	235	16.2
Tallow	92	....
Tin	450	25.6
Zinc	786	50.4

To express heat of fusion in calories per kilogram:

B.t.u. per lb. × 5/9 = cal. per kg.

Difference Between Melting and Freezing Points—The melting point of a substance does not always correspond exactly with its freezing point, even at the same pressure. The melting point of ice is more uniformly constant than the freezing point of water, and for this reason is taken to indicate the zero of the centigrade scale (32° F.).

The solidification of a liquid is generally accompanied with crystalization, and the formation of the crystals is often delayed in a quiet medium, so that the temperature of water free of air may fall as low as 5 deg. F. when perfectly quiet and not freeze. But if the water at this low temperature be stirred or jarred the whole will instantly change to ice or become solid.

The Coal Age Pocket Book

Effect of Pressure on Vaporization—Pressure acts to retard vaporization. An increase of pressure, therefore, **raises the boiling point** of water and other liquids. For the same reason a decrease of pressure lowers the boiling point of liquids. At an elevation of 10,000 ft. above sea level, under normal atmospheric conditions, pure water boils at 193 deg. F., and at an elevation of 15,000 ft. the boiling point, for the same normal atmospheric conditions, is reduced to 185 deg. F.

Vaporization, Evaporation, Boiling—Vaporization is a general term relating to the formation of vapor, or the change from a solid or liquid state to a vaporous or gaseous condition, without regard to whether the change is slow or rapid.

The term "evaporation" relates to the slow vaporizing of a solid or liquid that takes place at its surface when the latter is exposed to an atmosphere that is not fully saturated. The evaporation of a liquid may also be caused by the application of heat.

The term "boiling" refers to the violent ebullition that takes place throughout the mass of a liquid, caused by the formation of vapor in the liquid and its escape to the surface. Boiling results from the application of heat to the liquid, or may result from a sudden decrease of pressure.

Boiling Points of Liquids—A liquid boils when raised to such a temperature that the tension of its vapor is equal to the pressure at its surface. At this point the liquid becomes vapor. The term "boiling point," as commonly used, however, refers to atmospheric pressure at sea level, unless otherwise stated. The following table gives both the freezing and the boiling points of a few liquids of interest in mining:

FREEZING AND BOILING POINTS OF LIQUIDS

Liquid	Freezing Point, Deg. Fahr.	Boiling Point, Deg. Fahr.
Alcohol	—202	172
Ammonia	..	140
Linseed oil	—18	597
Mercury	—38	676
Nitroglycerine	45	...

Mechanical Equivalent of Heat—Since heat is assumed to be a form of energy, it must be capable of performing work, which is expressed in foot-pounds. This has given rise to what is properly called the "mechanical equivalent of heat." It is the theoretical amount of work expressed in foot-pounds or kilogram-meters per unit of heat absorbed.

The values of the several heat units are as follows:

	Foot-Pounds	Kilogram-Meters
1 British thermal unit	778	107.5
1 calorie	3087	426.8
1 pound-calorie	1400	193.5

The reverse of these values is as follows:

	B.t.u.	Cal.	Lb.-Cal.
1000 foot-pounds	1.285	0.324	0.714
1000 kilogram-meters	9.297	2.343	5.168

Inquiries of General Interest

Testing Safety-Lamp Glasses

Kindly describe the tests to which glasses for use in safety lamps are subjected by the Federal Bureau of Mines before they are approved by the bureau.

FIREBOSS.

Floreffe, Penn.

The Federal Bureau of Mines has outlined in schedule 7, issued by the bureau Jan. 30, 1915, certain tests of miners' safety lamps that will enable the bureau to establish a list of so-called permissible safety lamps for use in mines in which explosive gas is liberated. The schedule is entitled "Procedure for Establishing a List of Permissible Miners' Safety Lamps." Safety-lamp glasses are actually tested twice—once in the fully equipped lamp and again when separated from the lamp. The first set of tests is for the purpose of determining the strength of the glass to resist breakage when in place in the lamp. The three tests are as follows:

1. The lamp fully equipped is suspended at a clear height of 6 ft. above a wooden floor and dropped. The lamp is subjected to five trials. If the glass is broken once only, the lamp passes the test. If the glass is broken twice, the lamp is subjected to five more trials, when two more breaks will determine the failure of the lamp to pass the test.
2. A lead disk, 3 in. in diameter and 1¾ in. thick, weighing 5 lb., is dropped from a clear height of 6 ft. onto the lamp standing vertically on a wooden floor beneath. Should the glass break in the lamp, two more trials are made, each with a different glass fitted in the lamp. A second break in these three trials will determine the failure of the lamp to pass this test.
3. The lamp is suspended by means of claws gripping the top of the lamp, at a height of 7 ft. above the floor. A lead disk, 4¾ in. in diameter and 1½ in. thick, weighing 10 lb., is attached to a cord the other end of which is fastened to the center of a metal plate that is firmly attached to the bottom of the lamp. When all is ready, this weight is dropped through a clear distance of 6 ft., the purpose being to test the resistance of the lamp to being pulled apart. The lamp is subjected to three trials, and if any one of these trials shows the lamp to be defective in any way or lacking the necessary security in gas, the lamp fails to pass the test.

These three tests are made in succession on one lamp, and cracking of the glass is regarded as a breakage.

Lamp glasses designed for use in safety lamps are subjected to two tests when separated from the lamp. These tests are designed to show the resistance of the glass to breakage by reason of a blow or by reason of a sudden change of temperature, such as may be caused by water coming in contact with a hot glass. These tests are as follows:

1. A lead disk, 2½ in. in diameter and ½ in. thick, weighing 1 lb., is dropped from a clear height of 4 ft. onto the glass placed in a vertical position on a wooden floor. Twenty glasses of a kind are tested, and two failures by breakage cause the rejection of this type of glass.
2. Ten glasses of a kind are heated in an air bath to a temperature of 212 deg. F., and at that temperature are removed from the bath and immediately plunged into water at a temperature of from 60 to 65 deg. F. One failure by breaking or cracking of the glass in these 10 samples will cause the rejection of this type of glass.

Where lamps have two glasses, the outer glass is tested to determine its resistance to a blow, while the inner glass is tested to determine its ability to withstand change of temperature only.

⁂

Electric-Power Transmission

Kindly explain what size of wire would be required to carry an electric current sufficient to charge a storage-battery locomotive equipped with 50 Gould special lead cells of 300-amp. capacity. The charging station is 3000 ft. from the substation. The pressure at the substation is 250 volts, while that required for charging is 125 volts.

JOHN F. BUTLER.

Roderfield, W. Va.

The question, as stated, is slightly ambiguous in respect to the current capacity. It is not certain from the wording of the question whether the charging rate is 300 amp. or whether the capacity of the cells is 300 ampere-hours, since it is customary to give the capacity of storage-battery cells in ampere-hours.

However, assuming that the charging rate is 300 amp., and allowing for a line drop of 250 — 125 = 125 volts, the circular mils of wire required to transmit a current of 300 amp. 3000 ft. and return is given by the formula

$$\frac{21.6 \times 300 \times 3000}{125} = 155{,}520 \text{ circ.mils.}$$

A No. 000 copper wire has a sectional area of 167,800 circ. mils, while a No. 00 wire has an area of 133,100 circ. mils. Since the result obtained above lies between these two values, a No. 000 copper wire should be used for this transmission.

Assuming, however, that the cell capacity is 300 amp.-hr. and taking the efficiency of the storage cells as 80 per cent., the required input when charging is 300 ÷ 0.80 = 375 amp.-hr. It is customary to assume an 8-hr. charging rate; and, in that case, the charging current would be 375 ÷ 8 = 47 amp., nearly. Therefore, taking the required charging current as 50 amp., the circular mils of copper wire required to transmit a current of 50 amp. 3000 ft., allowing for a line drop of 125 volts, is

$$\frac{21.6 \times 50 \times 3000}{125} = 25{,}920 \text{ circ.mils.}$$

For this transmission, a No. 6 copper wire should be selected, having an area of 26,250 circ. mils, as taken from electric-wire tables.

Examination Questions

Illinois Examination for Mine Managers, June 14, 1915

(Selected Questions)

Ques.—Find the specific gravity of a mixture containing 1 cu.ft. of air, 2 of hydrogen, 3 of carbon dioxide and 4 of nitrogen.

Ans.—Hydrogen being the lightest of these gases, it will be more convenient to refer the density of the other gases to this element as unity; thus, the density of air referred to hydrogen is 14.4; that of carbon dioxide is one-half its molecular weight, or ½ (12 + 2 × 16) = 22; while that of nitrogen is expressed by its atomic weight, 14. The volume of each gas multiplied by its density expresses the relative weight of the gas referred to hydrogen as unity, which gives the following:

	Vol.		Density		Weight
Air	1	×	14.4	=	14.4
Hydrogen	2	×	1	=	2
Carbon dioxide	3	×	22	=	66
Nitrogen	4	×	14	=	56
Totals	10				138.4

The density of this mixture referred to hydrogen as unity is then found by dividing its relative weight by the total volume of the mixture; thus, 138.4 ÷ 10 = 13.84. That is to say, the mixture of these gases is 13.84 times as heavy as hydrogen, volume for volume.

To find the specific gravity of this mixture referred to air as unity, divide its density referred to hydrogen by the density of air referred to the same standard. Thus, 13.84 ÷ 14.4 = 0.961, which is the specific gravity of the mixture referred to air as unity.

Ques.—A pair of hoisting engines has cylinders 30 in. in diameter and the stroke is 5 ft. If the steam pressure in the boilers is 90 lb. per sq.in., how many revolutions per minute will these engines be running when generating 1000 hp.?

Ans.—Taking the boiler pressure as 90 lb. gage and allowing a drop of, say, 3 lb. between the boiler and the steam cylinders of the engine, and assuming a two-third cutoff for a slide-valve engine, the mean effective pressure in the steam cylinders may be estimated as 68.6 lb. per sq.in. The total area of the two cylinders is $2\ (.7854 \times 30^2) = 1413.7$ sq.in. Since the engine makes two strokes per revolution, the work performed by the two cylinders during a single revolution of the engine is 68.6 × 1413.7 × 2 × 5 = 969,800 ft.-lb. Then, since 1000 hp. is 1000 × 33,000 = 33,000,000 ft.-lb. per min., the speed of this engine to develop this power must be 33,000,000 ÷ 969,800 = 34 r.p.m.

Ques.—What is the horsepower required to drive a fan producing 60,000 cu.ft. of air per minute with a water gage of 1.7 in.? If the quantity be increased to 100,000 cu.ft. per min., how much additional power will be required?

Ans.—For a circulation of 60,000 cu.ft. per min. under a water gage of 1.7 in., the power on the air is (60,000 × 1.7 × 5.2) ÷ 33,000 = 16+ hp. Then assuming an efficiency of 60 per cent. for this circulation, the power required to drive the fan is 16 ÷ 0.60 = 26.6 hp.

Since the power on the air varies as the cube of the quantity of air in circulation, the effective horsepower required to increase this air volume from 60,000 to 100,000 cu.ft. per min., calling the required hp. x is

$$\frac{x}{16} = \left(\frac{100{,}000}{60{,}000}\right)^3 = \left(\frac{5}{3}\right)^3 = \frac{125}{27}$$

$$x = \frac{16 \times 125}{27} = 74 + hp.$$

The gross horsepower required to drive the fan in this case is 74 ÷ 0.60 = 123 hp.

Ques.—An entry contains a mixture of 65,000 cu.ft. of firedamp and air. If 10 per cent. of firedamp is present, find the additional quantity of air necessary to dilute it to 2 per cent.

Ans.—The volume of marsh gas present in this firedamp mixture is 65,000 × 0.10 = 6500 cu.ft. If this quantity of gas is 2 per cent., the total volume of the mixture after the addition of air is 6500 ÷ 0.02 equals 325,000 cu.ft. The quantity of air required to be added to produce this volume is then 325,000 — 65,000 = 260,000 cu.ft. of air.

Ques.—If a wedge is 12 in. long and 3 in. thick, and the pressure 100 lb., what weight will be lifted?

Ans.—Assuming the wedge is 3 in. thick at the butt and disregarding friction, the ratio of the pressure applied to drive the wedge to the weight lifted is equal to the ratio of the thickness of the butt to the length of the wedge. Since the length of the wedge is four times the thickness of the butt in this case, the theoretical weight lifted by a force of 100 lb. will be 4 × 100 = 400 lb.

Ques.—You are asked to state what you understand by the term "potential" and "potential difference," in electrical appliances.

Ans.—The term "potential," as applied to electricity, describes the electrical pressure required to pass a certain current through a conductor having a given resistance. Potential in electricity corresponds to pressure or head in hydraulics.

The term "difference of potential" is the difference of electrical pressure between two points in the circuit. In other words, it is the effective pressure required to pass the current through that section of the circuit lying between the two points in question.

Ques.—To light a mine with 200 lamps of 16 cp. each, what amount of mechanical energy would have to be available for conversion into electricity?

Ans.—The ordinary 16-cp. incandescent lamp, operated on a 110-volt circuit consumes, say 3.5 watts per cp. The total wattage required to operate a system of 200 such lamps is 200 × 16 × 3.5 = 11,200 watts, which is equivalent to 11,200 ÷ 746 = 15 hp. Now, allowing for an efficiency of 80 per cent. in this system, the mechanical energy required is 15 ÷ 0.80 = say 20 b.hp., making no allowance for transmission in the mine.

Coal and Coke News

Washington, D. C.

The Interstate Commerce Commission has handed down a decision in the co-called Industrial Railways case which is likely to be of considerable interest and importance to coal producers, in two ways. Considerable coal is transported over these roads to industrial plants which are large consumers of fuel, while the effect of the decision on the general tariffs of the long haul roads is of importance to shippers of all classes of goods and especially to those shipping the heavier articles.

The case in question is that docketed as "In the matter of allowances to short lines of railroad serving industries" and is concerned with the lines of those carriers which have been owned as a rule by industrial concerns which needed direct connection with a trunk line. Some time ago, following the original report of the Commission in the Industrial Railways case, the trunk line carriers in official classification territory. withdrew from joint rate arrangements heretofore had with the industrial roads and also with substantially all other industrially owned lines in the territory which were not involved in that proceeding.

Altogether, more than 47 industrial roads became involved in the proceeding and the Interstate Commission set out to gather the facts regarding the history, operation and practices of each of the lines thus involved. Circulars were mailed to each carrier and the replies tabulated. The Commission sought to establish in each case whether the line affected was a bona fide common carrier, whether the service performed by it was a "plant service" or was public transportation, and whether a charge should be made for such service in addition to the line haul rate applicable to or from points on the rails of the trunk line at the junction.

With these questions there was also to be considered the larger economic question whether or not part of the money paid to the trunk line carriers for public transportation service is to be used to defray the expense of particular shippers in conveying their traffic to and from the terminals of the trunk line carriers.

The Six Groups of Carriers

Pursuing its inquiry, the Commission finds that the carriers referred to may be divided into six groups, each of which is subject to somewhat different conditions of traffic, ownership, or control. In all, however, the Commission holds that the conditions which originally gave rise to the present system of industrial railways, with their special and independent rate structure, have altered, so that on the whole it is deemed wise to follow with them the course adopted in the Tap Line cases, by requiring that each line which becomes a party to a rate arrangement with a road shall file immediately upon the consummation thereof a full statement of the arrangement entered into, showing specifically the basis of rates to be applied from points on industrial lines and the basis of the allowances or divisions thereof granted under the agreement.

In general, justifying this finding, the Commission holds that:

1. The principles laid down in the original industrial railways decision some time ago do not apply to sundry of the lines with which joint arrangements have heretofore been cancelled by the long-haul lines.

2. Some of the industrial lines are distinguishable from those discussed in the Tap Line cases only in that the Tap Lines are not located within a territory from which rates are made under a large blanket of originating points.

3. Some of the industrial lines while maintaining the form of common carriers are in effect performing only private transportation.

4. Some of the industrial lines, like the Tap Lines, should have joint rate arrangements, but the basis of rates should be revised.

5. Some of the industrial lines have taken on the form of common carriers by means of leases of facilities of the trunk lines, and such arrangements are in some cases a device to defeat the law.

6. Some of the industrial lines are not common carriers in any sense.

In concluding its opinion requiring the publication of industrial railway tariffs and the filling of the divisions and arrangements thereof, the Commission says:

> These cases (referring to certain which it has cited) illustrate the passing of the necessity for that provision of section 15 under which shippers may be compensated by the trunk lines for their facilities used in the handling of their own shipments. This legislative measure was enacted to give this Commission a means of eliminating certain unjust discriminations. The gradual elimination of discriminatory practices by other processes leaves this provision of the law to be used as a cloak for various payments which, but for it, would be looked upon as rebates. The Commission will look to the trunk lines to reform their tariffs and file with this Commission whatever arrangements they may make with the industrial lines here in question in the light of this report.

PENNSYLVANIA

Anthracite

Plymouth—Since the closing down of the Dobson No. 12 colliery through litigation several months ago, the mine has been flooded with water from adjoining workings, the level now being up close to the mouth of the shaft. Some of the water has leaked into the red-ash vein of the Gaylord colliery closing 30 places.

Wilkes-Barre—The Pennsylvania Coal Co. has been made defendant in a $50,000 damage suit entered by Franciska Guinta, of Pittston, on behalf of herself and minor child. Her husband, while employed at No. 6 colliery, was killed by a premature explosion.

In a majority opinion renderd recently, Judges P. A. O'Boyle and John M. Garman fixed $3000 per acre as a fair and equitable assessment on coal land. Judge H. A. Fuller in a dissenting and minority opinion fixed $1920 as a fair assessment. The decision of the majority of judges sustains the action of the county authorities in fixing $3000 per acre as the triennial assessment for 1907. It is anticipated that the case in question where these opinions were derived will be appealed to a higher court.

Carbondale—Fuller E. Layman recently started a suit in trespass against the Sacandage Coal Co. to recover $5000 for damages caused to his house and lot by mine caves. In the statement accompanying the suit, Layman set forth that the company illegally removed coal from under his property causing a subsidence of the surface.

Hazleton—Because George Patrusky, a docking boss at the Evans colliery, at Beaver Meadow, changed his boarding place from a private home to a saloon against the protest of John Bredbenner, the foreman, who feared Patrusky would subject himself to bribes in the shape of drinks from the men the 100 miners of the works recently struck.

Harrisburg—Until the Supreme Court shall decide upon the constitutionality of the act of 1913 relating to certificates to be given to mine foremen and assistants, no certificates will be issued, according to a decision recently reached by the Dauphin County Court. This court has upheld the act and its decision has been appealed to the Supreme Court. It now holds in effect that the appeal acts as a supersedeas and prevents operation of the law until a final decision is reached.

Summit Hill—For several years the Bloomingdale Coal Co. has been conducting prospecting operations on land in this vicinity, but it has now abandoned the work. This has been necessitated by the fact that during all this time it has not discovered any workable deposits of anthracite.

Bituminous

Johnstown—Nicholas Losick was killed, John Dono lost his right eye and sustained severe injury to the lungs, and John Sowick, Michael Sabrick, J. E. Ellison, and John Daniels were badly injured by the accidental discharge of a quantity of dynamite at Elton on the evening of July 8. The men were engaged in sinking a shaft for the Berwind-White Coal Co.

Laborers engaged in excavating preparatory to the paving of Fern Place in this city have struck the "C" vein of coal, which lies unusually close to the surface at that point and half the material being taken out is burnable coal. The vein was struck less than 3 ft. below the surface and although mixed with a great deal of clay is declared fit for household purposes, "with a little cleaning."

Brownsville—Fifty-ovens of the Newtown plant of the H. C. Frick Coke Co. that have been idle for more than a year have been ordered fired up. Plans for the improvement and reopening of the Champion mine near Brownsville are under way. This mine has been idle for nearly two years and as a consequence contains much water in addition to many falls that have occurred since the suspension.

Pittsburgh—Judge John D. Shafer in the common pleas court of Allegheny county recently fixed the date for the sale of the Pittsburgh-Buffalo Coal Co. against which action was begun last August by the Union Trust Co., of Pittsburgh in a bill of equity. The date was set for July 15. The bill asked for the satisfaction of two mortgages, one for a $2,000,000 bond issue which the trust company financed and the second asking indemnity for a loan to the company on the paper given it by the officers of the company. This latter obligation was placed by an attorney of the company at $1,750,000 which makes the Union Trust Co.'s claim against the coal company approximately $4,000,000. Other liabilities of the company are said to total several millions more. The holdings of the company consist of five separate mines. These are the Marianna, the Hazel, the Frances, the Johnetta and the Bertha mines. John H. Jones is the president of the company and D. G. Jones is the general manager. The financial troubles of the company are said to have been hastened by the formation of the Four States Coal & Coke Co., an auxiliary concern, into which was put much of the revenue of the Pittsburgh-Buffalo Co.

Otto—The Pittsburgh Gas and Coke works at Otto, Westmoreland Co. which have been closed down for months will soon resume operations. The company has spent much money in making improvements. All the ovens have been relined while several other big changes have been made to the plant. Two new buildings are now under construction and a big force of workmen is engaged in getting the plant in readiness for a general resumption.

Connellsville—The production of Connellsville coke attained unusual activity during the week preceding July 4. Shipments reached 377,000 tons, while production was 371,000 tons. The merchant operators continue to fire some ovens and to increase their output, which ran 140,000 tons during the week in question. During the first half of the year the Connellsville coke production reached 7,300,000 tons, or at a rate less than 15,000,000 tons annually. The rate of production has been rapidly increasing, however, both in merchant and furnace ovens.

WEST VIRGINIA

Grafton—The coal and general freight trade through the northern half of West Virginia continues to hold up in a satisfactory manner and the railroads are busy. Railroad shops are working heavy forces of men to keep machinery in repair and to handle the traffic. Coal companies in this district have heavy coal orders and most of the mines are working at capacity.

Bluefield—It is said that the demand for coal is becoming greater day by day, and every factor is favorable to make July a record-breaking month, with even a greater production than June, which saw the largest month's business in the history of the Norfolk & Western R.R., except the labor supply. The output during the first few days of July was considerably short of the average daily record of June. The Fourth of July vacation was not lost sight of in connection with this alleged shortage in the output of the mines.

Charleston—Of the 30,000 Italians employed in the coal fields and lumber camps of West Virginia, fully 5000 are reservists in the army of their native country. Hundreds of these are now on their way to engage in the campaign against the Austro-Germans. The men who have left and are now leaving are what are known as "specialty men," listed on the army records as engineers, surveyors, electricians, linemen, automobilists, general machinists, etc. It is said that 100,000 Italian-Americans are answering the call of their mother country, but it is estimated that it will take nearly all summer to secure transportation facilities for all the men who have now responded. The departure of these laborers may, however, mean a considerable decrease in the output of the West Virginia coal mines.

ALABAMA

Birmingham—The first shipment of coal from the Birmingham district by water to Mobile has just been completed by the Pratt Consolidated Coal Co., the coal going through the recently completed lock 17 on the Warrior River. The shipment was of 1000 tons. Officials of the company state that the cargo of coal was delivered in Mobile at about half the cost of rail shipping. This company has just completed a new tipple and dock at Maxine where the barges are being loaded. The Maxine mine is one mile from the river and the coal is hauled from the mine in dump cars which are run out on the tipple.

Six lives were lost in the coal mines of Alabama during June.

Examinations for first and second class mine foreman's certificate and fire boss certificate will be held in Birmingham July 26-29.

KENTUCKY

Viper—The Perry County Block Coal Co. organized here recently, advises that it will begin shipping coal Aug. 2, and will have an initial output of 500 tons daily. The plant is on the main line of the Lexington & Eastern R.R.

Sturgis—The West Kentucky Coal Co. was host recently to its employees, at its annual outing.

Harlan—The Big Four order being handled by the Harlan Coal Mining Co., with another contract, enables the company to keep one of its mines operating steadily six days a week. The other two, however, as is the case with most of the mines in the section, are working on part time.

OHIO

Columbus — The Ohio Mining Department was recently called upon to settle a labor dispute at a mine in eastern Ohio. The work of taking out the pillars and ribs was being done by quite a number of men who were said not to be practical miners and a complaint was made. It was ruled by the department that only practical miners should be used in the work, and these orders were promptly complied with.

According to the report of the Ohio Mining Department for the first six months of the year, there were 22 fatal accidents in the period as compared with 35 for the first six months of 1914. While mining operations during the past six months have been curtailed and necessarily the number of men employed is smaller, it is pointed out that during three months out of the first six months of 1914 practically all of the mines in the state were idle. One of the peculiarities of the report is the fact that four miners dropped dead in the mines from heart disease, during the first six months of 1915, which is extremely unusual.

Bellaire—Announcement has been made that the local mine of the A. J. Morgan Coal Co. will be shortly abandoned and the office of the company moved to Bannock where a tipple is being constructed, preparatory to opening a new mine at that place. The abandonment of the local mine will mean that about 100 coal miners will be compelled to secure employment elsewhere, or remove to the city of Bannock.

Employees of the Rail and River mines have been idle for the past few days, in order that new scales may be installed at the mines. According to the agreement between the miners and operators, all the mines are to have their scales placed at the mines no later than July 20, or in sixty days following the ratification of the recent wage scale.

ILLINOIS

Belleville—Loot taken from the office of the Tower Grove Coal Co., on Lebanon Ave., this city, was recovered when three boys were arrested recently. The office was entered a few nights ago and everything that appealed to the fancy of the boys was taken. The stolen articles were recovered where the boys had buried them.

L. Senior, of Victoria Coal Co., with offices at St. Louis and Belleville, operating the Branch mine on the Illinois Central R.R., has announced that the Royal mine, on the Louisville & Nashville, between Belleville and East St. Louis, will be reopened as soon as repairs are finished. A new tipple is being erected. The mine was operated by the Royal Mining Co., which failed two years ago, owing the miners considerable sums. Mr. Senior has paid the miners and nothing now stands in the way of resumption.

Danville—The Illinois State Mine Examining Board had a meeting here recently. Dates announced for other meetings are as follows: Eldorado, July 13; West Frankfort, July 14; Herrin, July 15; Murphysboro, July 20; Belleville, July 21; Staunton, July 22; Pana, July 23; Springfield, July 27-28.

O'Fallon—The Joseph Taylor Coal Co. of this place has obtained a writ of certiorari in the St. Clair County Circuit Court, calling for the records in the case of Albert Southern, heard before the Illinois Industrial Board. Southern was employed in the St. Ellen mine here. He broke a blood vessel and was allowed by the Industrial Board $79.50 at the rate of $6.15 a week. Later he made another application, on the ground that he was indefinitely incapacitated and was awarded 50 per cent. of his wages until further orders of the board. The company contends the 50 per cent. award is not valid because the claim had already been adjusted.

FOREIGN NEWS

London, Eng.—Walter Runciman, president of the Board of Trade, announced in the House of Commons on July 13 that in view of the failure at agreement between the South Wales coal owners and their miners the government had decided to apply to the mining industry the Munitions of War Act. This act makes it an offense to participate in either strike or lockout unless the differences involved have been submitted to the Board of Trade, which body has referred the matter for settlement by one of the methods prescribed by the act. In this case the government takes the ground that the strike is prejudical to the production, transportation and supply of munitions of war.

Toronto, Canada—D. A. Thomas, known as the Welsh coal king, has during the last two years spent a large amount of money in prospecting along the waterways to the north of Edmonton, Alta., and is convinced of the abundance of coal resources in that district. These coal fields are to be opened up by the construction of a railroad from Athabasca to Fort Vermilion, a distance of some 300 miles. An agreement to that effect has been signed by C. S. Law, representing Mr. Thomas, and Hon. A. G. Mackay, acting on behalf of the Athabasca & Fort Vermilion Railway Co., which holds a charter from the Alberta Legislature. It is officially stated that reconnaisance work on the route will be begun forthwith by a full engineering staff. It is expected that the road will be completed within two years.

PERSONALS

John Frazier has been appointed mine manager at No. 3 mine of the Superior Coal Co., filling the vacancy caused by the resignation of John Day.

P. H. Shanahan, who has been assistant superintendent of the Superior Coal Co., at Gillespie, Ill., for several years, having come up from the position of machine runner, has been promoted to the position of superintendent.

When Deputy Mine Inspector Samuel McMahon, of West Virginia, returned home recently from his first trip of inspection he was presented with a safety razor and fountain pen as a token of appreciation from the employees of the LaBelle No. 4 mine.

Lawrence H. Underwood, for the past three years in charge of the byproducts coke plant of the Gary works of the United States Steel Corporation, has been recently appointed superintendent of the new byproduct coke plant now in course of construction for the Youngstown Sheet and Tube Co., at Struthers, Ohio.

P. J. Rogers, of Ensley, Ala., has been appointed by Governor Henderson as president of the Convict Bureau. Mr. Rogers is superintendent of the Pratt Mines Division of the Tennessee Coal Iron & R.R. Co., and was strongly endorsed for the position to which he has been appointed by his many friends in the mining circles of Alabama.

C. C. Rose, general manager of the Delaware & Hudson Coal Department, has been seriously ill at his home for some time. He has not been in good health for the last year or more having suffered much from rheumatism. He is at present in an exceedingly exhausted condition and is not gaining strength as fast as his friends might desire.

OBITUARY

William H. Gorman, president of the Gorman Coke & Coal Co., the Cumberland Coal Co., and the Piedmont Mining Co., died recently at the Bedford Springs Hotel, at Bedford Springs, Penn. Mr. Gorman was also a director of the Citizens National Bank, the Maryland Casualty Co., and the Citizens National Bank, of Laurel, Md.

Colonel Jones T. Pierce, one of the pioneer coal operators of the Birmingham district, died recently in Bowling Green, Ky. Colonel Pierce was closely connected with the early development of the district and for years was a prominent citizen of the section. He centralized his activities in the Warrior coal field where he formed the old Pierce-Warrior Coal Co. Some 20 years ago he removed to Kentucky, where he acquired interest in coal mines.

INDUSTRIAL NEWS

Pittsburgh, Penn.—The Pittsburgh Coal Co. has opened an agency at 46 Reconquista, Buenos Ayres, with C. Bulman as local manager. It has also acquired a depot at La Boca (Port of Buenos Ayres).

Washington, D. C.—The Department of Justice has announced that an appeal will be taken to the Supreme Court in the Reading coal trust case, which has been decided against the government at Philadelphia in the United States District Court for the eastern district of Pennsylvania.

Dickson City, Penn.—Becoming lost in the Johnson colliery, Lawrence Brady, a miner, 60 years old, was found after having almost succumbed to exhaustion and lack of food. He had gone into the mine to take out his tools, when his light went out and having no matches he wandered around in the dark, until his absence from home alarmed his family and a searching party was formed.

Woodward, Ala.—The Woodward Iron Co. has begun the erection of a benzol plant adjacent to its byproduct coke plant at Woodward. The plant will have a capacity of 3000 gal. This plant is built for the Woodward company and the Thomas A. Edison Co., has also just completed a benzol plant at Woodward. The Tennessee Coal & Iron Co. is nearing the completion of its 12,000 gallon benzol plant at Fairfield.

Philadelphia, Penn.—The Lehigh Valley R.R. Co. is using the tug "Wyoming," of its coal barge towing fleet, as the basis of experimenting with a coal saving device. The apparatus consists of a superheater placed over the boilers of the tug and it is confidently predicted that the mechanism will be the means of a fuel saving of over $3000 on this one boat alone, in addition to which greater motive power is derived from the steam.

Harrisburg, Penn.—The Auditor General's office is sending out notices to 130 coal producing companies in the various anthracite districts requesting them to make a return of their June production in accordance with the new coal tax law enacted by the last legislature. This is an increase of 10 companies over those reporting under the law of 1913, as the present act has been drawn to include all companies operating coal bank washeries.

Athens, Ohio—With the view of relieving destitution among the miners and their families in the Hocking Valley where many mines have been closed down completely, Governor Willis, of Ohio has called upon the Ohio Highway Commission to have the contracts for road improvement in the vicinity of Athens, Nelsonville and Gloucester pushed. Considerable road improvement in that section is contemplated and it is believed that miners will seek employment at this work.

Cincinnati, Ohio—Two coal steamers were sunk in the local harbor on the Ohio River during the terrific rain-and-wind storm on the evening of July 7. The "Convoy," belonging to the Hatfield Coal Co., of Covington, Ky., capsized and sank, with a number of her crew, and the towboat "Fulton," belonging to the Monongahela River Consolidated Coal & Coke Co., used as a harbor boat here, was sunk when struck by an empty barge which had broken loose. Capt. Bradley Williams, of the "Fulton" was missing after the storm cleared away, and is believed to have been lost.

Birmingham, Ala.—The petition against the Louisville & Nashville R.R. and Southern Ry. for a rate of 50 cents per ton on steam coal for manufacturing purposes was denied, by the State Railroad Commission recently. The commission ordered the Louisville & Nashville to establish a rate of 60 cents per ton on coal from mines located on the Helena, Blocton, Colena, Belle Ellen and Acton branches to the Keystone Lime Works at Keystone and other lime kilns at Wilmay, Saginaw, Longview and Vernon. All petitions for increase of coal rates into Birmingham were denied by the Commission.

Philadelphia, Penn.—The Board of Commissioners of Navigation has compiled and published the export statistics of this port for the six months ending June 30. During that period there has been loaded over the piers into both foreign and coastwise bottoms 434,874 tons of bituminous coal as compared with 317,498 tons for the same period of 1914; and 24,959 tons of anthracite as against 20,574 tons in 1914. The increase of over 100,000 tons of bituminous is accounted for by the extended inquiries for coal from abroad since the beginning of the war, and an even greater increase is predicted for the last half of the year judged by the way the tonnage is going forward this month.

Coal Trade Reviews

General Review

Anthracite being offered at heavy concessions. Large accumulations of nut coal. Export bituminous trade continues the predominating feature. Domestic market lifeless. Improved tone in the Middle West.

Competition has become so keen in the anthracite market that even conservative old-line companies, handling the very best grades, are being forced to make concessions. There is a notable dearth of new business which will be even more acute over the last half of the month unless the retail movement increases. Although mining operations are heavily restricted, abnormal supplies are accumulating in all directions particularly on chestnut coal, the situation on which is rapidly becoming acute. Poor collections among the retailers continue the rule and this is being reflected back to the operators; particular significance is attached to this feature by the failure of two weak members of the trade and there is some anxiety among the large operating companies regarding long deferred payments.

An exceptionally heavy export movement from the Virginia piers is the predominating feature of interest in the bituminous trade. The demand has been so insistent that a few agencies have even become short of supplies and are urgently crowding the railroads for rush shipments. This is in great contrast with recent conditions at that point as well as the current situation in the other markets.

Stocks at Tidewater are still large and occasional cargoes can usually be picked up at low prices without much difficulty. There is no activity in any line except industries working on war orders and shipments are confined almost entirely to contracts. There is, however, a distinct feeling that the coastwise market is gradually toning up and conservative interests are a trifle more cautious over future commitments though there has been no significant price change of any kind.

So little spot business is being done in the Pittsburgh district that prices are not well defined though they are probably even lower if anything. Operations are at 50% capacity and there is considerable coal accumulating that is difficult to move. The Lake shipments have proved particularly disappointing and the movement for the current month will probably be even less than June.

An increased movement of West Virginia coal in the Lake trade has encouraged the Ohio operators somewhat, even though they have not benefited materially. Otherwise the market situation is discouraging. The manufacturing demand continues to lag appreciably behind normal, and the demand is limited in all directions. Some stocking for domestic purposes is being done, and the threshing trade is absorbing a small tonnage, but all branches are unusually quiet.

There is a greater improvement in the Middle West where the business for the current month shows some increase over June. General quietness still prevails, and there are even a few weak spots, but there is a growing conviction that the demand will be on the increase from now on, in spite of the waiting attitude among the buyers. A significant development has been the resumption of the full-time operations at the Gary Steel Mills for the first time since 1912. Other features of a constructive nature are the restrictive programs regarding mine operations, anticipation of greater coöperation among the operators, and the expectations of a heavy rush for coal the coming fall.

A Year Ago—Anthracite trade has touched the low point of the year with buying somewhat less than customary. Eastern bituminous market under heavy pressure. Curtailment of operations and tendency to hold tonnage closely are the most encouraging features. Middle Western trade developing a steadily accumulative strength.

BUSINESS OPINIONS

American Wool and Cotton Reporter—More inquiry has developed from the woolen mills during the week than has been in evidence for some time. The light weight goods season is beginning and duplicate orders have been made on heavy weight goods. Growers are still maintaining firm prices, as well as the dealers. The trend is still decidedly upward.

Boston News Bureau—The situation continues to show that the influences bearing upon it are not generally known or understood. The conditions operating change quickly and a man is at loss to shape his conclusions. The astonishing fact is that the loans made by the allies since the war have reached over ten billion dollars, and Germany and her allies have borrowed half as much, making total war loans to date about sixteen billion dollars. It is very possible that the enormous cost of the war may force the question of peace earlier than the reports from the field indicate. Some good people are banking on this idea.

Iron and Steel—The rapid and continued strength and increase in activity in the steel trade in suprising. The United States Steel Corporation has purchased 55,000 tons of billets and with 80% of its blast furnace capacity in operation is not making any especial headway on accumulated orders. Its export business alone amounts to 10,000 tons a day. Structural steel work is much more active. The fabrication shops of the country are operating to 80% of capacity compared with 30% at this time last year. An order for 200,000 tons of rail from the Russian Government is under negotiation by two of the largest independent companies; French interests are also endeavoring to buy 20,000 tons of rails. Domestic business is more active. The Burlington has purchased 2000 freight cars.

Government Crop Report — The Government's condition estimate of 93.3% on the spring wheat crop is the highest for July since 1904. The estimate of 295,000,000 bu. spring wheat for the country as a whole gives the three Northwestern States 227,00,000 bu. or 19,000,000 bu. over last month's estimate, and compares with 207,000,000 bu. estimated a year ago. The corn crop indication of 2,814,000,000 bu. is the third largest on record, but compares with 2,916,000,000 bu. a year ago. Oats promises to be the largest crop on record, and, unless seriously damaged, the final returns are estimated to exceed the record yield of 1,418,000,000 bu., the present estimate being only 19,000,000 bu. under that figure. The trade considers the report as bearish on all grains. The carry-over is 55,000,000 bu. of wheat, against 76,000,000 bu. last year.

Marshall Field & Co.—Wholesale shipments of dry goods have been about normal. Collections have been exceedingly good, as compared with those of the same week a year ago. Buyers are beginning to arrive in the market from the far Western States to look at fall lines.

Bradstreet's—Irregularity in distributive trade contrasts with enlarging activity in industrial lines, continued absorption of idle workingmen, heavy war orders, increased bank clearings, and a generally good crop outlook, notwithstanding rainy weather at harvest in parts of the winter wheat belt. Except in sections where seasonably dry weather has prevailed, selling by final purveyors has been checked by low temperatures or too much rain.

Dun's—Uniform progress is not to be expected at this period, when inventorying and the advance of the vacation season tend to produce quietness in various mercantile lines. It is significant of the economic changes resulting from the war, however, that industrial conditions do not reflect the usual mid-year lull, and all indications point to fully sustained activity throughout the summer months.

ATLANTIC SEABOARD

BOSTON

Better trend in Pocahontas and New River. Excessive water power restricts coal consumption. Delivered prices still low in spite of diminished receipts. Georges Creek in demand off-shore. Certain Pennsylvania grades in strong position. Anthracite inquiry sags off.

Bituminous—The demand off-shore is moderately active and so long as that continues the Pocahontas and New River shippers will be relieved of any special pressure to move coal. Concessions in price are still confined to a few factors and there is now a distinct feeling that the coastwise market is gradually toning up. So far there has been nothing significant in the way of price movement, but the agencies are beginning to be cautious about giving options and there is a more conservative trend with regard to futures. Not much improvement can be looked for in this territory so far as demand is concerned for most of the contracts have now been closed, but with the export trade in good shape it is probable that prices f.o.b. will strengthen as fall approaches.

The extra inquiry that was expected on account of deficient water-power will not materialize because of a heavy fall that has more than made up for the dry season earlier. Delivered prices show no change. Distributors inland have large stocks and still seek to place current coal at minimum prices. Arrivals have been rather less than normal however, and there is very little free coal afloat.

Only small tonnages of Georges Creek are available for this market. The bulk of this grade is still being loaded for export, and barges and steamers for New England ports are obliged to wait until foreign bottoms have been given clearance. The chief shippers stand in favorable relation to new business that develops from the Mediterranean.

One of the features of the present market is the strong position of some of the Pennsylvania grades. Several of these have ample business in hand until the fall demand starts in. The choice Cambrias and Somersets have not only held their tonnage in this territory but in several instances they have made notable inroads, and this notwithstanding the low prices named by Hampton Roads shippers. More than a few of the Pennsylvania grades have now established themselves in quarters where formerly nothing but Pocahontas and New River would be considered.

Water Freights continue about as last reported; 80c. on barges, 2500 tons upward, is the prevailing rate, Hampton Roads to Boston, with only a light demand; 40c. is still the rate from New York to Providence and Fall River. The rate on hatch-loads of bituminous in anthracite carrying transportation, Philadelphia to Boston, continues at 80c.

Anthracite—While orders are still in fair supply with most of the shipping companies, there is beginning to be a dearth of new business. The latter part of July is likely to see the demand very light and to continue so until retail stocks begin to move faster to the consumer. Concessions are made more freely even by conservative shippers, but such inducements are no more than as usual at this season.

Current quotations on bituminous are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.40@2.85	2.92@3.02

BALTIMORE

Export shipments slowing down. War business marks only real industrial activity. Prices continue low.

From present prospects the July exports will fall off to about the 100,000-ton mark, which is regarded by many shippers here as nearer the true basis for the future. Last week the cargo coal loaded totaled 56,192 tons, although of course there was one holiday during the period. Outside of this there is little real industrial activity except on war orders. Machine shops here are busy and khaki and cotton duck plants are working on large orders. Elsewhere there is little business enthusiasm, and not much prosperity talk is heard.

The situation is well reflected in the coal trade, despite the big comparative movement of coal on export. Prices continue weak and producers find it difficult to keep enough of their product moving to prevent congestion at the mines. High-grade coals of West Virginia, Maryland and Pennsylvania are selling at from $1.20 to $1.40. Low-grade West Virginia and Maryland coals are offering down to 75 and 80c. to the trade at the mines, with ordinary Pennsylvania coals at 90 to 95c. Mines that are covered at all well with contracts are not letting fuel go at all on the present spot prices.

NEW YORK

Export demand increasing. Local market continues quiet. Spot business dull. Contract coals moving well. Anthracite situation unchanged. Inquiry from abroad for hard coal. Small steam sizes show improvement.

Bituminous—There is very little demand for spot coal and prices are unchanged. Interest is centered on the export demand which seems to be increasing. Contract holders are taking their full quota and many large users are picking up odd cargoes to replenish their stock piles.

The suspension of mining over last week's holiday and a few days idleness following, affected production materially. While the docks are filled there is not so much coal on hand as to affect prices. Spot orders are scarce.

Operations continue on about half-time basis and shippers do not look for much new business until fall. While stray cargoes of fair coals have been picked up at low prices choice grades have been held at good figures.

The brightest feature of the situation continues to be the export trade. Much coal is being shipped to Halifax, it being reported that many schooners have left this port for that vicinity. Exporters report having received additional inquiries from France, Italy and Spain. While considerable business is being closed, shippers complain of the excessive freight rates. The demand for bunker coals is also on the increase.

Current quotations are on the following basis:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.30@3.40	$3.30@3.40	$3.30@3.40	$1.75@1.85

Anthracite—The first half of July has shown no material improvement in the anthracite situation. Notwithstanding the continued restriction in mining there seems to be as much, if not more, of the prepared coals on hand as during the past month. There is a slight improvement in the small steam size situation due to the curtailing of production. The demand has not increased. Some of the companies are storing considerable of the smaller buckwheat coals. No improvement in operations is looked for, it being expected the mines will continue to work on about half-time schedule during this and next month. Considerable optimism is expressed as to the outlook for September.

Some of the larger shippers have received inquiries with regard to anthracite for export, a few of the inquiries having come, according to report, from England. No deals are reported as being closed.

Chestnut coal continues in abundance, much of it being in bottoms. Considerable stove and egg is in boats waiting for buyers. As a result bottoms are scarce for buyers who desire either a mixed or small cargo.

Pea coal continues about the same as last week. Inquiry for No. 1 buckwheat of the better grades has been good the prices quoted running at about $2.20. The same as regards inquiry may be said with regard to Nos. 2 and 3 buckwheat. The cheaper coals can be obtained at much lower prices.

Current quotations are about as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.85		$4.90	
Egg	5.10	$4.80	5.15	$4.85

Barley	1.75@2.00	1.45@1.70	1.80@2.05	1.50@1.75

PHILADELPHIA

Anthracite dull, with collections slow. Chestnut size continues a big problem. Bituminous trade inactive, although water shipments continue in large volume.

Anthracite—The strenuous efforts of the salesmen to sell coal constituted the only sign of activity in the market the past week. The dealers have no orders to give as may be imagined from the very few coal teams seen on the streets.

Prices continue well off circular on what little coal is being sold and reports are current of low prices being protected for future delivery on all sizes. One large company, long noted for the quality of its product and strict adherence to the circular, is known to have accepted orders at June prices on the last day of the month for protection over a long period.

Chestnut coal is continuing to pile up and it is absolutely impossible to move any appreciable quantity of it. One company has made arrangements to dump its large surplus at the Port Richmond piers and pay the storage charges until fall, feeling that this will be more profitable than sacrificing the coal at 40c. to 50c. per ton from the circular. There has been no improvement in the price of pea coal, the quotations running from $1.60 to $2, but the market is practically glutted and very little effort is being made by the companies to push it for this reason.

The long shut down over the Fourth of July has enabled a number of the individual shippers to release a lot of coal that had been accumulating demurrage. Despite the fact that this market is practically unable to absorb all the coal that is coming from the mines there are reports of new operations starting and which will market their product here. The Lawrence colliery is already in operation, producing 1800 tons a day and the East Bear Ridge colliery expects to start up early in August with a possible output of 1000 tons daily.

The circular prices are as follows:

	City	Tide
Broken	$3.20	$4.45
Egg	3.45	4.70
Stove	3.70	4.70
Chestnut	3.85	4.95
Pea	$2.50	$3.25
Buckwheat	1.25	2.25
Rice	.85	1.75
Barley	.50	1.50

Bituminous—The expected improvement has not as yet made itself evident, although hopes continue high, despite the fact that the market is practically at a standstill. Some shippers even complain that conditions are worse than last week. However, the ocean tonnage continues to hold up and good shipments are going to South American and European countries, particularly France, Italy and Spain. There is a fair vessel tonnage available, but owners are becoming more firm in rates, and it is reported that quite a few sailing vessels have signed up for long voyages at good figures.

Prices ruling are about as follows:

Georges Creek Big Vein	$1.65@1.75
South Fork Miller Vein	1.50@1.60
Clearfield (ordinary)	1.00@1.20
Somerset (ordinary)	1.00@1.15
West Va. Freeport	.85@ .95
Fairmont gas, mine-run	$1.15@1.25
Fairmont gas, slack	.65@ .75
Fairmont lump ordinary	.85@ .95
Fairmont mine-run	.75@ .80
Fairmont slack	.45@ .55

VESSEL CLEARANCES

The following vessels have cleared from Norfolk and Newport News, July 2 to 9, inclusive:

Norfolk

Vessel	Destination	Tons
Kayma	Rio de Janeiro	3734
Trente	Genoa	4900
Maria C.	Porto Ferrajo	4434

Crescent	Halifax	686

HAMPTON ROADS

Week's dumpings show up well both in coastwise and export. Indications are July movement will surpass June.

The dumpings over the piers at Hampton Roads for the week have been very good both as regards coastwise and export movement. Of the latter the largest percentage of the coal has been for the Italian ports. The coastwise shipments have, with few exceptions, all gone to the New England ports.

The demand for coal for export continues heavy and prices are firm. The demand for prompt movement has been such during the week that it has been almost impossible to take care of vessel tonnage as fast as it arrived in port. In a number of cases shippers are short of coal and are urging the railroads to rush shipments. There are very few shippers at Tidewater who have any great excess of coal on hand; such free coal is, in most cases, either nut and slack or high volatile. Some of the shippers have a fair amount of coal on hand but it is for contracted tonnage about due.

Railroad Tonnages—Dumpings over the local piers for the past several weeks compare as follows:

Railroad	Week Ending June 12	June 19	June 26	July 3	July 10
Norfolk & Western	197,533	207,824	213,279	211,017	174,822
Chesapeake & Ohio	89,447	71,511	79,870	83,678	76,397
Virginian	34,975	51,644	87,840	58,455	57,467
Totals	321,955	330,979	380,989	291,828	308,686

OCEAN CHARTERS

The following charters have been reported from various sources during the past week:

OCEAN FREIGHTS

A number of steamers have been chartered to take coals to South American, Mediterranean and West Indian ports, and recent charters to Lower Plate ports were at $8.28, although it was claimed that others were offering $8.40 at the same time for boats of similar size, and in similar position. Four large British steamers are reported as having been chartered for three trips each, for coals to the West Coast of Italy, at $9.72, but we think this report is incorrect as we had the same boats proposed to us at $9.60 for three trips. Single charters are at considerably less than this rate, our last fixtures being at $8.64@8.88 to West Italy.

The freight market is quotable on the following basis:

To	Rate	To	Rate
Havana	$2.00@2.25	Bermuda	**$3.00**
Cardenas or Sagua	**2.75**	Vera Cruz	3.50@3.75
Cienfuegos	2.75@3.00	Tampico	3.50@3.75
Port au Spain, Trinidad	**3.50**	Rio	8.40@8.64
St. Lucia	**3.50**	Santos*	**8.64**
St. Thomas	3.00@3.25	Montevideo	**8.34**
Barbados	**3.50**	Buenos Aires or La Plata	**8.40**
Kingston	2.75@3.00	Rosario	**8.76**
Curacao	3.25@3.50	West Coast of Italy	8.64@8.88
Santiago	2.50@3.00	Barcelona**	**8.16**
Guantanamo	2.50@3.00	Valparaiso or Callao	6.25@6.50
Demerara	**4.25**	Marseilles	**8.40**

Note—Rates noted in **bold face type** are only approximate.
* Consignees paying dockage dues. **Spanish dues for account.
W. W. Battie & Co.'s Coal Trade Freight Report.

Note—Charters for Italy, France and Spain read: "Lay days to commence on steamer's arrival at or off port of discharge. 24c. per net register ton per day demurrage."

LAKE MARKET

PITTSBURGH

Market conditions hardly as favorable. Lake movement apparently decreasing. Prices unsteady but unchanged. Operations barely over 50% of capacity and there are little indications of any immediate improvement.

The holiday did not sensibly diminish the amount of coal available. Many of the mines, probably the majority, are operating only two to four days a week, so that the holiday did not reduce their week's production at all. Lake shipments have shown no improvement, and may be lighter in July than they were in June. There can be no lack of vessel room, as the ore movement down the Lakes in June exceeded that of a year ago by half a million tons, and July is expected to show a still larger gain.

There is continued call for export coal, and while the Pittsburgh district operators have been unable to take any important tonnage, some of the Connellsville operators have built up a steady trade, which is increasing and may soon exceed 10,000 tons a week. Contracts for mine-run to Apr. 1 are occasionally booked at close to $1 a ton, while on ¾-in. $1.15 is sometimes shaded. So little contract business is being done that prices are not well defined. The ordinary market for free coal is about as follows, slack not usually bringing over 45c., while Youghiogheny gas slack, not being in very liberal supply, is fairly steady at 50c.: Slack, 45@50c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. Mines are not operating at much over 50% of capacity.

BUFFALO

Dull week due partially to the holiday. Slack a very poor seller. Bad state of Canada trade. Anthracite as dull as ever. Mines running at a slow rate.

Bituminous—The demand is light and will continue so for awhile, though there are still members of the trade who state that orders are increasing. It is hard for anyone to account for the difference between this summer and that of two years ago, especially as there is so much money in the country and the export balance is so heavily in our favor.

The demand for slack is particularly light and there is considerable on track that cannot be sold. The Canadian trade is far from satisfactory; not only is it very dull, but there is every indication that it is going to remain so for awhile. Shippers estimate that not more than half the usual amount of bituminous is going over. It is figured that the extra duty and the decline in the price of Canadian coal, which is coming further west from Nova Scotia, has placed local shippers at a disadvantage of 30c. The shippers who made the prices in the spring do not intimate that there is any new basis for it, which is $2.70 for best Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack, with slack selling often at badly cut prices. Allegheny Valley coal remains at 25c. below Pittsburgh.

Anthracite—There is little improvement in the trade; midsummer sales are always light and they are even lighter now than the average. There appears to be a rule on the part of all sorts of consumers to buy nothing that is not needed at once. There is a falling off in Lake coal shipments for the week, the amount being only 97,725 tons, but one of the trestles has been idle part of the week to make changes in its approaches, so that may be one reason for the reduction. The movement of holiday week, however, is never up to the average.

CLEVELAND

Michigan buyers take large tonnage of No. 8 slack giving market firmer tone. Coarse coal goes begging.

Michigan buyers have taken between 500 and 1000 cars of No. 8 slack the past week at 55c. at the mines and the market is firm at that figure. Fairmount slack usually goes to the trade taking this coal. Youghiogheny and Fairmount are both up 10c. a ton. Lump coal is selling on the spot market at five to fifteen cents below quotations. There is very little demand for coarse grades and buyers are getting all they want at their own price.

The Lake trade is extremely dull. Ore shippers operating boats are trading ore cargoes for coal cargoes, ton for ton. Coal cargoes are usually traded for ore cargoes on the basis of two or three cargoes of coal for one of ore. The ore traffic is rapidly improving and shippers are independent so far as ore business for their ships is concerned.

Quotations for shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	Ohio No. 8
Lump	$3.45	......	......	....	......
Lump, ¾ in.	.....	$2.15	$1.90	$1.85@1.90	$1.85@1.90
Egg	3.45	......	......	....	......
Mine run	2.65	2.05@2.10	1.80	1.80	1.75@1.85
Slack	......	1.55	1.45	1.50	1.45

COLUMBUS

Trade continues rather quiet. Stocking is being done in larger volume. The small sizes are strong.

The trade has been quiet in every department. Demand for steam sizes has been limited and the same is true of the Lake trade. Stocking of domestic fuel is attracting more attention but on the whole the demand from that source is not as strong as was expected. Rural dealers are buying better to take care of the threshing trade. The tone of the market is not very good and future prospects are not bright.

In the steam trade, buying off the open market appears to be the rule. Contracts have mostly been signed up but in some cases the consumer is buying at cheap prices outside of contracts. Steam consumption is not very large and manufacturing is at a low point. The demand for railroad purposes is not increasing to any extent. On the whole the steam business is dead in most localities.

Lake trade is increasing slightly, but the larger percentage of the increase comes from West Virginia coal. Considerable tonnage is being shipped from eastern Ohio to the Northwest. From the Hocking Valley the tonnage going to the lakes is not large. Docks in the Upper Lake ports are still congested.

Retail trade is rather quiet although Pocahontas and West Virginia splints are in fair demand. White Ash and smokeless are also being bought for stocking. Hocking lump is being stocked only to a limited extent. Buying for school purposes is now attracting the attention of retailers and a considerable tonnage will be sold during the coming month. Retail prices are well maintained in Columbus, despite the business depression.

Prices in the Ohio fields are:

	Hocking	Pomeroy	Kanawha	Eastern Ohio
Rescreened lump	$1.45	$1.50		
Inch and a quarter	1.35	1.35	$1.30	
Three-quarter inch	1.25	1.30	1.25	$1.20
Nut	1.15	1.25	1.15	....
Mine-run	1.05	1.10	1.05	1.00
Nut, pea and slack	.70	.75	.65	.65
Coarse slack	.60	.70	.55	.55

Mines have been working at about the following percentage of full capacity:

District	Week Ended June 19	June 26	July 3	July 10	District	Week Ended June 19	June 26	July 3	July 10
Hocking	25	25	25	20	Cambridge	30	30	20	25
Jackson	15	20	25	15	Masillon	35	30	15	25
Pomeroy	50	45	30	45	Eastern O.	45	50	40	60
Crooksville	30	25	55	30	Average	33	32	30	31

TOLEDO

West Virginia coal still the best feature of the Toledo markets. Hopes of a more favorable rate adjustment to the Lakes.

There seems to be a little more life to the market here than for weeks past. The Lake movement is showing some improvement but is not what it should be for this season of the year. Considerable Lake coal is arriving but most of it is from West Virginia.

Local dealers express the opinion that freight rates may soon be adjusted to a more favorable basis for the Ohio mines. The Supreme Court of Ohio in a decision handed down last week confirmed the right of the State Public Utilities Commission to lower the rate on coal shipments from Nelsonville to Toledo from $1 to 85c., the Commission having made that order about five years ago on complaint by the New York Coal Co., of Columbus.

Pocahontas coal has stiffened a trifle in price and there is some demand. Hocking and all Ohio grades are extremely slow. Kentucky coal is showing some improvement and West Virginia is fairly active. Steam coal is slow in demand and dealers are holding back on stocking orders. Prices are not held very close to the list.

CINCINNATI

Business quiet although the feeling is better than for some time. Indications are that the worst is over.

The demand is almost wholly lacking. The beginning of the end of the depression seems to be at hand, although as yet it is not manifest in the shape of any actual business. The trade feels that price concessions have reached the maximum, and that even the most reckless will soon realize the futility of mortgaging the future on the basis of the present dullness.

LOUISVILLE

Retail situation slightly better but prices fluctuate over wide range. C. & O. operators invade Kentucky markets.

The retail situation is improving slightly but there is little if any change in the industrial demand. Chesapeake & Ohio operators have been able to invade the Louisville market and take a contract which heretofore had been considered the property of the eastern Kentucky companies. This is for 40,000 tons of long flame West Virginia coal for the Standard Sanitary Manufacturing Co.'s Louisville plant, to be used in the company's enameling kilns. The West Virginia shippers get a rate 5c. lower than the eastern Kentucky, and it is stated that the price was sharply cut on the coal itself. It is intimated that the Kentucky operators may lodge a complaint involving the rate.

COKE

CONNELLSVILLE

Spot furnace coke up and down again. Continued light demand for merchant coke with steadily increasing production and consumption by the steel interests.

The stiffening in spot furnace coke over the national holiday was evidently largely sentimental. Operators accumulated some surplus coke, on track, in anticipation of an extra demand, and held to higher prices until it became clear that there would be no extra demand of importance. A week before Independence Day the market moved up from $1.50 to $1.60, and later two or three sales were made at $1.75, but after the holiday the free coke was found to be in excess of the demand and the price dropped to $1.60.

There has been no negotiating on contracts. The divergence between the position of the steel works and the position of the merchant furnaces is still more pronounced. The steel trade is improving steadily, while fresh weaknesses are appearing in the merchant pig iron market, discouraging idle merchant furnaces from getting into blast. A sale of basic iron in Pittsburgh was recently made at the lowest price for years, the seller being a Lake front furnace. In consequence of these conditions the production and shipments of coke increase steadily while the demand for merchant coke, from merchant furnaces, experiences practically no increase. We quote: Prompt furnace, $1.60; contract furnace to Jan. 1, $1.75; prompt foundry, $2@2.50; contract foundry, $2.20@2.50, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended July 3 at 371,414 tons, an increase of 15,936 tons, and shipments at 376,957 tons, an increase of 30,580 tons. These increases were doubtless due largely to anticipation of the holiday.

Buffalo—There is a continuation of increased output of coke and some of the shippers are asking an advance in prices. The prospect is that if the stir continues there will be better business all along the line, but some members of the trade decline to report anything better than a larger tonnage, though they are aware that if the increase continues there will have to be an advance. From Pittsburgh comes the report that steel is more active, so there is at least a prospect of an end to the long period of dullness. Quotations are firmer on the basis of $4.15 for best 72-hr. Connellsville foundry and $2.20 for stock coke.

Chicago—Byproduct coke has been in good demand at firm prices, and foundry coke seems to gain momentum slowly. Prices are as follows: Byproduct, $4.65@5.10; Connellsville, $4.75@5; Wise County, $4.75; gas coke, $3.75@4.90, furnace, $4.75.

MIDDLE WESTERN

GENERAL REVIEW

Sales of Indiana and Illinois coals increasing perceptibly. Eastern grades not quite so active. Screenings show further declines. Anthracite business light.

There is no rush in the buying movement, but it makes slow and steady advances. July so far shows an increase over the June demand, and shippers expect a rush of orders toward the end of July or early in August. The weak spots in the market have been reduced to a minimum. Although storage orders are beginning to appear, a waiting attitude is still noted at most of the retail yards both in the city and country, and also among large consumers, but it is felt that this indifference is bound to quicken into activity before many weeks pass.

Indiana and Illinois shippers are now strongly urging the trade to stock up immediately while transportation facilities are favorable for furnishing prompt delivery and prices are low, but so far this has not been acted upon by most buyers. The tendency is to operate the mines only sufficient to cover orders already received, keeping prices well in hand, and shipping no consignment coal.

Interviews with the more important of operators show the unanimous feeling that future prospects look bright. This opinion is not based on any visible increased volume of business, but is rather the result of the coöperative spirit which now pervades the Western territory. This is largely due to joint selling plans which are now working with a larger degree of success in Indiana, the Springfield district, among the Franklin and Williamson County operators, and the Standard field south of East St. Louis.

INDIANAPOLIS

Heavy storms interrupt the movement. Threshing and school demand opening up. Gary mills on full time.

The heaviest July rain in 41 years of the weather bureau service in this state, washed away some sections of main lines of railroads and several mine switches, interfering to some extent with mine operations and retarding the movement of cars. The Monon was apparently the worst sufferer.

Otherwise the Indiana coal situation is not much changed. The screenings market has recovered from its recent tendency to weaken and is now firm at 80 to 85c. f.o.b. mines. There is only light demand for domestic lump, the supply of slack coming mainly from 1¼-in. railroad business. The threshing demand has begun to take some of the best domestic lump and during the latter part of the month and through August, the school boards of the state will also be purchasers of this grade.

The industries are showing no marked increase in activity, but they are absorbing the current restricted output. The plants of the Illinois Steel Co. at Gary are in full operation for the first time since 1912. Some of the larger coal mines are also reported on full time and others are operating three to four days a week. Retail yards have still their summer schedule of prices.

CHICAGO

Price advances have stimulated more orders. Outlook in Springfield district more encouraging than for a long time. Market for Indiana grades expanding.

The advance in prices of Franklin County coals stimulated orders, mostly from retail dealers. Domestic sizes have been moving fairly well with few or no orders for steam sizes, and screenings have declined about 10c. per ton since last week. Williamson County operators are also receiving increased orders at the advanced prices, and have shipped a considerable volume of coal at list figures to Northwestern points.

Some of the Saline and Harrisburg County operators have also made an advance of 15c. per ton on domestic sizes, but the increased production of lump has resulted in an excess quantity of fine coal, the price on which has eased off to about 75c. per ton. The mines have averaged in operating time one day more than last week.

A fair amount of orders have been received by the Springfield operators at the higher prices which went into effect on the first of the month and the situation has been more encouraging than for many months past. Screenings are easier. There has been a small increase in the movement of railroad coal from this district.

Several Chicago retail yards have placed contracts for Indiana domestic 4-in. lump, and it is reported the prices are around $1.50 for the entire season's requirements. The market for this grade has expanded, and very little has been sold during the past week below $1.35.

Smokeless coals are not so strong, and egg has been offered recently below list prices. Shipments are also coming forward more promptly, which has had a disquieting effect on the trade. Pocahontas mine run prices are well held, and average around $1.10 to $1.25 per ton. A slight advance in the demand for splint for steam purposes is noted.

The prices on Kentucky coals are not attractive, and still continue most variable. Quite a tonnage of fine coal is reported moving to northern Indiana points under contract for steam purposes.

Increased orders for stocking have been received by Hocking shippers, and prices are firm. Movement of Hocking for Lake delivery is very slow.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

ST. LOUIS

Larger movement than for some time and prices better. Orders continue scarce, but more inquiries are coming in from retail trade.

The unchanged prices which have prevailed for several weeks are giving way to fluctuations here and there which encourage coal men to anticipate an improvement in the near future. Following the breaking of the deadlock among the Standard operators last week, there have been a number of changes in prices. Although the orders have not been large there has been a heavier movement during the past week than at any time since the beginning of the dull summer period.

On Williamson and Franklin washed the prevailing price for No. 1 has been $1.30 and for No. 2 $1.20 in the city but the list in the country has been $1.35 for No. 1 and $1.50 for No. 2. The demand for lump and egg has been stronger. There are more inquiries at city yards and domestic business is beginning to move. There is a perceptible strengthening of high-grade coal both in the city and the country.

THE CAR SITUATION

Statistical statement No. 6 of the American Railway Association shows the gross shortage of idle railroad cars of all kinds on July 1 to be 785, which compares with 218 on June 1, and 1333 on July 1 of last year. The gross surplus of coal and gondola cars on June 1 was 83,726, and the shortage 185.

MIDDLE WESTERN MOVEMENT

Bituminous coal forwarded from Indiana and Illinois mines over 17 principal railroads from April, 1914, to March, 1915, inclusive, was as follows, in short tons:

Illinois Central RR......	7,329,826	Southern Railway.......	1,202,623
C. & E. I. RR...........	6,270,987	B. & O. S. W. RR.......	901,708

St. L. I. M. & S. Ry... .	1,472,574		

COAL DIVIDENDS

The following are some of the more important dividends recently announced:

Lehigh & Wilkes-Barre Coal Co.—Dividend of $3.25 payable June 28 to holders of record June 17.

Texas & Pacific Coal Co.—Regular quarterly dividend of 1½% payable June 30 to holders of record June 20.

Pacific Coast Co.—Regular quarterly dividend on both the common and second preferred of 1% and 1¼% on the first preferred, all payable May 1 to holders of record Apr. 27.

Elkhorn Fuel Co.—Dividend of 1¼% on the preferred payable May 10 to holders of record May 1.

Lehigh Coal & Navigation Co.—Regular quarterly dividend No. 146 of $1 payable May 29 to holders of record Apr. 30. The transfer books do not close for this dividend.

New Central Coal—Dividend of 1% payable May 1 to holders of record Apr. 28.

Central Coal & Coke—Regular quarterly dividend on the preferred of 1¾%, payable July 1 to holders of record July 1 to July 15.

Island Creek Coal Co.—Regular quarterly dividend on the common of 50c. payable Aug. 1 and $1.50 on the preferred payable July 1, to holders of record July 23 and June 23, respectively.

Temple Coal Co.—Regular quarterly dividend of 2%, payable July 12 to holders of record July 2.

United Fuel Supply Co.—Regular quarterly dividend of 2%, payable June 21 to holders of record June 10 to June 21.

Alabama Fuel & Iron Co.—Regular quarterly dividend of 1%, payable to holders of record June 22 to June 30.

Lehigh Coal & Navigation Co.—Regular quarterly dividend of $1, payable Aug. 31 to holders of record July 31.

Lehigh Valley Coal Sales—Regular quarterly dividend of $1.25, payable July 17 to holders of record July 8.

Pittsburgh Coal Co.—Regular quarterly dividend on the preferred of 1¼%, payable July 24 to holders of record July 15.

FOREIGN MARKETS

GREAT BRITAIN

Interest centered on the labor unrest. An acute situation narrowly averted.

July 2—Interest regarding coal trade matters during the past week has been very largely concentrated upon the negotiations in South Wales, and the news that a basis for the amicable settlement of the questions in dispute had been arrived at by the intervention of the Government was received with a feeling of relief, although the narrow margin by which the proposals were agreed to shows how near we were to a strike which might have vitally affected the first line of defense. It seems almost incredible that at such a time as this as many as 112 men could have been found to vote in favor of such a disastrous course, for that is what their action virtually amounted to, and in view of this formidable opposition it is by no means certain that an amicable settlement will be arrived at without great difficulty. With regard to the labor situation generally much seems to be hoped from the conference in London next week; but the attitude of the miners generally in the present crisis is by no means reassuring, although it is possible that some arrangement for an increase of the output may yet be arranged.—"The Iron and Coal Trades Review."

July 2—Owing to labor troubles the market is in a very unsettled condition. Stocks of coal continue heavy and for immediate loading buyers could secure substantial concessions. For forward loading colliery owners are not disposed to quote in view of the unsettled labor situation. Quotations are approximately as follows:

Best Welsh steam.......	Nominal	Best Monmouthshires....	$6.24@6.48
Best seconds............	Nominal	Seconds................	5.76@6 00
Seconds................	$6.24@6.72	Best Cardiff smalls......	4.68@4.80
Best dry coals..........	6.24@6.48	Cargo smalls...........	3.60@3.84

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Outward chartering is on quiet lines, owing to the unsettled labor situation. Rates are approximately as follows:

Gibraltar.........	$3.84	Naples..........	$5 64	St. Vincent.......	$4.80
Marseilles........	4.83	Alexandria.......	6 24	Rio de Janeiro....	6.36
Algiers...........	4.54	Port Said........	6 24	Monte Video.....	5.76
Genoa...........	5.52	Las Palmas......	4.56	River Plate......	6.00

Later—Under date of July 15 the "Daily Chronicle" says: The outlook in South Wales is distinctly grave. The executive body of the South Wales Miners' Federation appears to be hopelessly divided, and a new conference of delegates has been summoned by telegram, to take place today. No instructions, however, have been issued by the executive body canceling the orders to the men to strike today, and it is considered almost certain, therefore, that a large part of the coal field will be idle today. This is despite the proclamation placing the dispute under the Munitions act, under which any striker becomes liable to a penalty of $25 a day.

CONTRACT NOTES

Meridian, Miss.—Contract for coal for the County of Lauderdale has been awarded to Carleton Hawkins.

Middletown, Del.—The Light & Water Commission at this place has awarded the contract for furnishing coal during the ensuing year to **Jesse L. Shepherd** at $3.20 per ton.

Buffalo, N. Y.—Receipts of iron ore by Lake are heavy, being 625,341 tons for June and 997,600 tons for the season to July, as against 733,393 tons to the same date last season. The shipments out are in excess of receipts.

Brazil—An American consular officer in Brazil transmits the name and address of the representative of a firm of engineers in his district, who desires to enter into commercial relations with American exporters of coal. References are given.

Salt Lake City, Utah—The Board of Education at this place purchases about 6000 tons of bituminous slack per annum. The call for bids is usually advertised and the business done on a competitive basis. Bids are required to cover cost of delivery to the buildings. Address Clk., L. P. Judd, Bd. of Edu. Salt Lake City, Utah.

+**New Ulm, Minn.**—The city contract for the year ending May 15, 1916, was awarded to **Bingham Bros.** of this city. Nine other firms entered bids for this business. The bid of Bingham Bros. on Pyrolite coal mined at Benton, Franklin County, Ill., was $3.37½ per ton for 2-in. screenings and $4.20 per ton for Youghiogheny screenings, was accepted by the council.

Hampton Roads, Va.—For quick loading the Chesapeake & Ohio Ry. has again made a record when on June 28 there was loaded by this road into the collier "Cyclops" 11,592 tons of cargo and bunker coal in the short space of 5 hr. 15 min. Previous to the loading of the "Cyclops" the record for fast loading of these government colliers was held by the Virginian Ry., which on June 26 loaded into the collier "Jupiter" 11,535 tons in 9½ hr.

Coal Prices at Panama—The Canal authorities give notice that on and after Sept. 1, 1915, the following prices will obtain at the Panama Canal for coal supplied steamships, including warships of all nations: Cristobal and Colon—Delivered alongside of vessel in lighters or in cars on the wharves, trimmed in bunkers, when handled by ship's gear (per ton), $6. Balboa—Delivered alongside of vessel in lighters or in cars on the wharves, trimmed in bunkers, when handled by ship's gear (per ton), $7. An additional charge of $1 per hour will be made for the use of each mechanical hoist or crane furnished by the Panama R.R. Co.

Anthracite State Tax—The P. & R. Coal & Iron Co. state they have no fear of the probe into the increase of coal prices due to the imposition of the anthracite tax passed by the legislature two years ago. The legislature recently adjourned have authorized an investigation into the increase of retail prices, but the officials state that while the retail price may have been increased 25c. per ton they have only added the tax to their usual price, which does not amount to 10c. per ton at the maximum. It has been the practice of this company to render their bills with the tax shown as a separate item and in the event that a refund should ever be required, their customers will have no difficulty in ascertaining the amount due them.

Boston—Recent enactment in Massachusetts of legislation designed to forbid the New Haven's buying coal from any corporation having a director who "interlocks" with that railroad makes interesting the fact that it has recently negotiated another contract with New England Coal & Coke Co. The New Haven's annual purchase of coal from this company is understood to be in the vicinity of 400,000 tons. Within a fortnight this coal company has retired from its board four directors who are on Massachusetts railroad directorates. There are two other big contracts included in the New Haven's coal supply. One is with Keystone Coal Co., which, after Agent Mellen, a son of former President Mellen of the railroad, had resigned under pressure from the transportation interests, secured a renewal of the sales-contract as of July 1 last. Another contract, running for five years to August, 1916, is with Virginia Iron, Coal & Coke Co., which has a contract also with the Boston & Maine. The recent Massachusetts legislation purports to require that Henry K. McHarg be out of the directorate of either that company or the New Haven before either the New Haven or the Boston & Maine can again buy coal from the Virginia Co. "Boston News Bureau"—(For additional notes on this contract see Vol. 7, p. 1088).

Pittsburgh, Penn.—The United States Engineers Office, opened bids June 21 for coal required for the operation of locks on the Monongahela and Ohio Rivers and work tributary thereto for the fiscal year ending June 30, 1916, then awarded contracts as follows: **Clyde Coal Co.,** nut and slack for Locks Nos. 1 to 5, Monongahela River, 3.9c. per bu.; nut and slack for Lock No. 6, Monongahela River, 3.95c., delivered in flats. **W. Harry Brown,** mine-run for Locks Nos. 1 to 5, Monongahela River, 4.75c.; mine-run for Lock No. 6, Monongahela River, 4.50c., delivered in flats. **C. F. Reed,** Charleroi; nut for Lock No. 4, Monongahela River, 5.5c., delivered by wagon. **Consumers Coal Co.;** mine-run for Lock No. 4, Monongahela River, 5.87c., delivered by wagon. **Clyde Coal Co.;** nut at 4.25c. and mine-run at 5.25c. for Lock No. 1, Ohio River, delivered in flats; nut and slack, 5.50c.; mine-run, 6.50c., for Lock No. 7, Ohio River, delivered in flats; nut and slack, 4.18c.; mine-run, 3.8c., delivered to steamers at tipples or in harbor; nut and slack, 4.25c.; mine-run, 5.25c., delivered in flats at Point Bridge landing. **Pittsburgh Coal Co.;** mine-run, $1.50 per net ton, for Lock No. 1, Ohio River, delivered by rail. **Moreland Coke Co.;** mine-run; $1.63 for Locks Nos. 4, 5 and 6, Ohio River; $1.64½ for Lock No. 7, Ohio River, Midland, Penn.; $1.39½ for Lock No. 8, Ohio River, Kenilworth, W. Va.; $1.39½ for Lock No. 9, Ohio River, New Cumberland, W. Va.; $1.24½ for Lock No. 10, Ohio River, Steubenville, Ohio. **Pittsburgh Coal Co.;** mine-run, $1.20, for Lock No. 3, Monongahela river, Elizabeth, Penn.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

For the official advertisements of bids wanted see the Contracts-to-Be-Let Section on Page 18.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

No. 854—Tompkinsville, N. Y.—Proposals on this contract (Vol. 7, p. 1085), which provide for furnishing the Lighthouse Service with bituminous and anthracite coal at New York, New London, Conn., and Newport, R. I., will be received until 2 p.m., July 28. Blank proposals and further particulars may be obtained on application. Address Lighthouse Inspector, Tompkinsville, N. Y.

No. 875—Idaho Springs, Colo.—The Boston-Colorado Power & Water Co. advises that this contract (Vol. 7, p. 1086), which provides for furnishing the company with approximately 3500 tons of slack coal, will probably not be negotiated until some time in September. Address Pur. Agt., Boston-Colorado Power & Water Co., Idaho Springs, Colo.

No. 895—Monticello, Ind.—Bids were received on this contract (Vol. 7, p. 1086), which provides for furnishing the Court House, Jail, and County Asylum with coal from the following companies: G. A. Kellinburgh; Central States Bridge Co., Rochester Bridge Co., Elkhart Bridge Co., F. M. Williams. Address Audr. A. G. Fisher, Bd. of County Comrs. Monticello, Ind.

No. 918—Kansas City, Mo.—This contract (Vol. 7, p. 1127), which provides for furnishing the local Water Department City Hall, Hospitals, etc., with approximately 25,000 tons of coal, will be let some time during the current month. Address City Pur. Agt. John P. Langan, City Hall, Kansas City, Mo.

No. 935—New York, N. Y.—Bids on this contract (Vol. 7, p. 1127), which provides for furnishing and delivering 2000 gross tons of No. 2 buckwheat to the Department of Docks and Ferries, were as follows: C. D. Norton & Co., $2.18; Pattison & Bowns, $2.14; George D. Harris & Co., $2.26; Gavin Rowe, $2.21; Clarksburg Coal Mining Co., $1.94. Address Commissioner of Docks and Ferries, R. A. C. Smith, Pier "A", Battery Place, New York City.

No. 991—Storrs, Conn.—Sealed bids will be received until noon, July 20, for furnishing the Connecticut Agricultural College with coal (p. 76). Separate bids should be submitted on each size. Address Connecticut Agricultural College, Storrs, Conn.

New Business

+1023—Wynne, Ark.—The Wynne Light & Water-Works at this place consumes about 1200 tons of Kentucky bituminous coal per annum. The contracts are generally let in August and the approximate cost is $3.35 per ton. The business is let on competitive bids. Address Purchasing Agent, Wynne Light & Water-Works, Wynne, Ark.

1024—Kansas City, Mo.—The Kansas City Stock Yards Co., one of the larger consumers of coal in this district, buys entirely in the open market. It consumes from three to five cars per week. Address Purchasing Agent, Kansas City Stock Yards Co., Kansas City, Mo.

+1025—Joliet, Ill.—The Illinois State Penitentiary will receive sealed bids until 10 a.m., July 31, for furnishing its annual coal requirements, estimated at approximately 20,000 tons. Bids are requested on mine-run and 1½-in. screenings. All proposals must be accompanied by a certified check for $200. Bids must be submitted on blanks which may be obtained on application. The contract is to run during the fiscal year beginning Aug. 2. Address Secy. Charles W. Faltz, Comr. of Illinois State Penitentiary, Joliet, Ill.

1026—Kansas City, Mo.—Smith, McCord & Townsend are said to be considering a contract for furnishing the fuel required in their wholesale dry goods business. About 150 tons will be bought. Address Pres. Leon Smith, Smith, McCord & Townsend, Kansas City, Mo.

+1027—Rapids City, S. D.—The Independent School District of this place will receive bids until noon, July 27, for furnishing approximately 200 tons of coal. Bids should include cost of delivery to the various school buildings as required. Address Secy. W. F. Haafke, Independent School District, Rapids City, S. D.

1028—Kansas City, Mo.—The Rossington Hotel is said to be considering contracting for about 250 tons of Cherokee slack and nut coal some time during the current month. Address Purchasing Agent, the Rossington Hotel, Troost and 30th St., Kansas City, Mo.

1029—Kansas City, Mo.—The local branch of the Cudahy Packing Co. is in the market for its annual supply of coal, involving about 190 tons of Cherokee slack per day. Address Purchasing Agent, Cudahy Packing Co., Kansas City, Mo.

1030—Kansas City, Mo.—Spalding's Commercial College, using 10 cars of soft coal a month, will let its contract about Aug. 1. Address Pres. J. F. Spalding, Tenth and Oak St., Kansas City, Mo.

1031—Kansas City, Mo.—The local branch of the Ford Motor Co. will let its annual fuel contract some time during the current month. It consumes about two carloads of slack coal per month. Address Purchasing Agent, Ford Motor Co., 11th and Winchester Ave., Kansas City, Mo.

+1032—Cleveland, Ohio—The Board of Education at this place will receive bids until noon, Aug. 2, for furnishing its annual fuel requirements during the ensuing year, about as follows: Anthracite, 300 tons; bituminous lump, 3000 tons; bituminous nut, 2500 tons; bituminous slack, 25,000 tons; semibituminous mine-run, 4000 tons; semibituminous lump, 4000 tons. All proposals must be accompanied by a surety bond for $2500, and the bidder must be prepared to enter into a contract within five days of receipt of notice. Specifications may be obtained on application, and all proposals must be submitted on blanks prepared for that purpose. The successful bidder will be required to furnish a corporate surety bond for 50% of the estimated amount of the contract. Address Dir. of Schools F. C. Hogen, School Headquarters, Rockwell Ave. and East Sixth St., Cleveland, Ohio.

1033—Kansas City, Mo.—The Cochrane Packing Co. at this place, which buys its coal in the open market, is said to be considering entering into a contract. It consumes about two cars of mine-run per month. Address Treas. C. E. Rowett, Cochrane Packing Co., Kansas City, Mo.

+1034—Youngstown, Ohio—The Board of Education at this place will contract some time in August for its annual requirements of coal, involving about 5000 tons of Pittsburgh lump. The current contract is being filled at $2.80 per ton. The call for bids is advertised. Address Board of Education, Youngstown, Ohio.

+1035—Pueblo, Colo.—School District No. 1 at this place usually contracts some time in August for its annual requirements of coal, amounting to about 1500 tons. The present contract is being filled with steam slack, which is costing $2.25 per ton. In addition to this contract there is another School District No. 20 which is not included in this. Address Secy. E. J. Scott, School Dist. No. 1, Pueblo, Colo.

1036—Kansas City, Mo.—The Frankel Frank Co. at this place usually contracts for its annual requirements of coal some time during the current month. It requires about 200 tons of bituminous coal. Address Purchasing Agent, Frankel Frank Co., 10th St. and Broadway, Kansas City, Mo.

+1037—Springfield, Ohio—The County Commissioners will receive bids until 10 a.m., July 22, for furnishing approximately 800 tons of bituminous coal. One-half is to be delivered to the County Infirmary and the balance to the Court House. Address County Commissioners, Springfield, Ohio.

1038—Kansas City, Mo.—Hugh Mathews, who has been buying the coal required at his machine shop in the open market, is said to be considering entering into a contract during the ensuing year. About 250 tons of lump and slack will be required. Address Hugh Mathews, Fifth and Washington St., Kansas City, Mo.

+1039—Kansas City, Mo.—The Butler Manufacturing Co. at this place will be in the market some time during the current month for about five cars of Cherokee nut coal. Address Asst. Supt. Fred. A. Rufi, 13th St. and Eastern Ave., Centropolis, Kansas City, Mo.

+1040—East Tawas, Mich.—The local Water and Light Department will be in the market some time next month for about 1300 tons of steam lump coal, which is usually bought at approximately $3.10 per ton. It is understood that the business is not let on competitive bids. Address City Clk. Alfred J. Noel, East Tawas, Mich.

+1041 — Yonkers, N. Y. — The Board of Education received sealed bids until 8 p.m., July 16 for furnishing approximately 3000 tons of free burning white ash anthracite. Egg coal was specified almost exclusively the only other sizes being 550 tons of pea and less than 100 tons of nut. Address Secretary Board of Education, Yonkers, N. Y.

1042—Ionia, Mich.—The warden of the Michigan Reformatory at this point will advertise next month for bids covering the 4000 tons of mine-run coal required by the reformatory for the season. The warden reports that bids will not be considered until that time. Address Warden Otis Fuller, Michigan Reformatory, Ionia, Mich.

1043—Chicago, Ill.—L. A. Budlong Co. will be in the market about Aug. 15 for approximately 12 cars West Virginia splint egg. Address Purchasing Agent, L. A. Budlong Co., Chicago, Ill.

1044—Kansas City, Mo.—The Sewell Paint & Glass Co. will contract during August for its year's supply of coal, amounting to about 35 tons of nut per month. Address Purchasing Agent, Sewell Paint & Glass Co., Kansas City, Mo.

+1045—Decatur, Ill.—The Board of Education at this place generally contracts in August for its annual requirements of coal, involving about 3845 tons of mine-run and 1¼-in. screened nut. The nut coal is usually bought at $2 per ton and the mine-run at $2.20. The call for bids is advertised. Address J. F. Roach, Bd. of Edu., High School, Decatur, Ill.

+1046—Two Harbors, Minn.—The Light and Water Department at this place generally contracts in either August or September for its annual requirements of coal, involving about 5000 tons of bituminous and 1200 tons of anthracite. The bituminous is usually bought at approximately $2.82 per ton and the anthracite (nut coal) at $6.47. The business is let on competitive bids. Address Light and Water Dept., Two Harbors, Minn.

1047—Kansas City, Mo.—William Volker & Co. will buy four cars of soft coal during the month of August. Address Purchasing Agent, William Volker & Co., Main and Second St., Kansas City, Mo.

1048—Middletown, Ohio—The Colin Gardner Paper Co. will be in the market for its annual coal supply on Aug. 15. Its normal requirements aggregate about 50,000 tons of nut and slack stoker coal. Deliveries are to be made in about equal weekly installments as specified and must be in hopper-bottom cars and delivered over the Big Four Ry. A grade of coal that will run satisfactorily over Murphy stokers, and particularly one that will not clinker, is required. Address Asst. Treas. M. S. Johnston, the Colin Gardner Paper Co., Middletown, Ohio.

+1049—Sioux City, Iowa—The Board of Education at this place will contract some time in August for its annual requirements of coal, involving about 2500 tons. "Purity" steam coal is being used on the present contract, for which $3.93 per ton is being paid. Address Purchasing Committee, Board of Education, Sioux City, Iowa.

1050—Kansas City, Mo.—Baker & Lockwood will let a contract about Aug. 1 for six cars of semianthracite slack and Cherokee nut. Its plant is located at the corner of Wyandotte and Sixth St. Address Pur. Agt. C. R. Summerville, Baker & Lockwood, Wyandotte and Sixth St., Kansas City, Mo.

+1051—Zanesville, Ohio—The Board of Education here usually contracts during August for its annual requirements of coal, involving about 1350 tons of mine-run. Bids are requested by letter. The usual price is about $2 per ton. Address Clk. C. J. Weaver, Bd. of Edu., Zanesville, Ohio.

+1052—Savannah, Ga.—The Board of Education at this place will purchase about 275 tons of anthracite some time in August. The call for bids is advertised and the business is done with local dealers. Address Committee on Supplies, Board of Education, Savannah, Ga.

1053—Kansas City, Mo.—The McPike Drug Co. will contract during the latter part of August for its yearly supply of slack, of which it uses about eight tons per day. Address Pres. W. T. Bland, McPike Drug Co., Central and Seventh St., Kansas City, Mo.

+1054—Ottumwa, Iowa—The School Board here will contract some time next month for about 1600 tons of screened lump coal, which is usually bought at $2.70. The call for bids is advertised. Address School Board, Ottumwa, Iowa.

+1055—Grand Island, Neb.—The Water and Light Commission at this place usually contracts some time in August for about 400 tons of coal. The business is let on competitive bids and usually goes at about $4 per ton. Wier City nut coal is being used on the present contract. Address J. H. Miller, Water and Light Dept., Grand Island, Neb.

1056—Kansas City, Mo.—The Gillpatrick Laundry Co. will let its coal contract during the month of August. It uses about 100 tons of slack coal per month. Address Purchasing Agent, Gillpatrick Laundry Co., Vine and 15th St., Kansas City, Mo.

+1057—Superior, Wis.—The Board of Education will contract some time in August for its annual supply of coal, involving about 2500 tons of lignite. The call for bids is advertised and the customary price is about $2.80 per ton. Address Board of Education, Superior, Wis.

+1058—Plymouth, Mass.—The County Commissioners at this place received bids until 9:30 a.m., July 13, for the coal required during the year ending July 1, 1916. About 400 tons of egg coal is required, to be delivered f.o.b. cars or wharf at Plymouth, probably at the rate of two carloads at a time, and 100 tons of Pocahontas, Cumberland, Georges Creek coal, to be delivered at the Court House at Brockton, probably at the rate of one carload at a time. Address County Comr. Lyman P. Thomas, Plymouth, Mass.

+1059—Toledo, Ohio—The Board of County Commissioners will receive sealed bids until 10 a.m., Aug. 10, for furnishing the coal required during the fiscal year beginning Aug. 17 at the Lucas County Court House, Armory and Power House. Deliveries are to be made as required, and all bids must be accompanied by a certified check for $100. Bids will also be received at the same time for furnishing the coal required at the Lucas County Infirmary during the same period. Bids on this last item should be made f.o.b. cars on railroad siding at Infirmary, and must be accompanied by a certified check for $100. Address Audr. Charles J. Sanzenbacher, Lucas County, Toledo, Ohio.

1060—Louisville, Ky.—B. F. Avery & Sons will issue specifications about July 20 for a six months' supply of nut and slack coal. About 75 cars will be required altogether, and deliveries will be at the rate of three cars per week beginning Oct. 1. Address Purchasing Agent, B. F. Avery & Sons, Louisville, Ky.

+1061—Mason City, Iowa—Bids were received until 11 a.m., July 12, for furnishing the Court House, County Farm and Hospital with about 1800 tons of coal during the ensuing year. Bids on the requirements for the Court House were to include cost of delivery in the bins, and those for the County Farm and Hospital were f.o.b. cars at Emery. Address County Audr. George E. Frost, Mason City, Iowa.

1062—Kansas City, Mo.—The Faultless Starch Co., 1025-27 East Eighth St., will be in the market for about 150 tons of soft coal during the month of August. Address Pres. J. G. Beecham, Faultless Starch Co., 1025-27 East Eighth St., Kansas City, Mo.

+1063—South Framingham, Mass.—Sealed bids were received by the Board of Education at this place for furnishing approximately 700 tons of bituminous and anthracite coal to be delivered at the local school buildings between Aug. 1 and May 1. Address Superintendent of Schools, Board of Education, South Framingham, Mass.

+1064—Joliet, Ill.—The City Council received bids until July 12 for supplying coal as follows: Best Illinois or Indiana mine-run for use at the Washington St. plant of the city water-works; 225 tons best Illinois mine-run and 100 tons of Pocahontas to be delivered as required for the Fire and Police Department; eight carloads southern Illinois 6-in. lump f.o.b. crematory. All deliveries are to be completed by Apr. 30 of next year. Address City Clk. Henry W. Odenthal, Joliet, Ill.

1065—Kansas City, Kan.—The Board of Education of Kansas City, Kan., will let its annual coal contract Aug. 5, at which time bids will be opened for 2000 tons of Cherokee lump. Address Pur. Agt. L. Friedman, Bd. of Edu., Kansas City, Kan.

+1066—Pella, Iowa—Bids will be received until July 20 for furnishing the City Electric Light Plant with steam, mine-run and lump coal, bids to include cost of delivery in the bin. Address Clk. A. C. Kuyper, Pella, Iowa.

+1067—Springfield, Ohio—Sealed bids will be received until 10 a.m., July 22, for furnishing and delivering coal as follows: 400 tons of Ohio, West Virginia or Kentucky splint mine-run to be delivered at the Court House, and the same amount and grade to be delivered f.o.b. sidetrack at the new infirmary at Donnellsville station. A certified check for $100 must accompany all bids. Address County Audr. J. M. Pierce, Springfield, Ohio.

1068—New York, N. Y.—The Department of Docks and Ferries will receive bids until noon on Wednesday, July 21, for furnishing and delivering 3000 gross tons of egg coal. Full particulars can be obtained at the headquarters of the Dock Department. Address Dock Comr. R. A. C. Smith, Pier "A," North River, New York.

+1069—Olivia, Minn.—The Board of Education for Independent School District No. 79 received sealed bids until 6 p.m., July 10, for furnishing the district with 100 tons of Youghiogheny lump coal during the ensuing year. Address Secy. George A. Peterson, Bd. of Edu., Olivia, Minn.

1070—Ashtabula, Ohio—The Board of Education will receive sealed bids until July 20 for furnishing approximately 100 tons of the best three-quarter Pittsburgh coal to be delivered to the local school building as required during the ensuing year. Address Clk. Charles E. Peck, Bd. of Edu., Ashtabula, Ohio.

+1071—Chippewa Falls, Wis.—The State Asylum at this place received sealed bids until 9 a.m., July 11, for furnishing 800 tons of screened West Virginia splint, Kentucky block and Hocking Valley lump coal to be delivered f.o.b. cars at the Asylum spur and Shawtown spur track. Deliveries are to be made as required between Aug. 1 of the current year and July 1, next year. Address Secy. Nan Macleod, State Asylum, Chippewa Falls, Wis.

+1072—Wadena, Minn.—The City Government received sealed bids until July 14 for furnishing approximately 1000 tons of Youghiogheny run-of-pile coal. Address Village Recorder A. C. Murray, Wadena, Minn.

+1073—Bridgeport, Conn.—Sealed bids were received until noon, June 9, for furnishing approximately 500 tons of bituminous coal to be used at the Public Library, the city yard and by the Fire Department. The business last year was done at $3.80 a ton. Address City Clerk, Bridgeport, Conn.

+1074—Buffalo, N. Y.—The lighthouse inspector at this place will receive sealed bids for furnishing the fuel required by the lighthouse tender "Crocus" during the fiscal year ending June 30. Blank proposal forms and particulars may be had on application. Address Lighthouse Inspector, Buffalo, N. Y.

+1075—Louisville, Ky. — The Louisville Industrial School of Reform, owned by the city and administered by a board, is calling for bids for a year's supply of coal. Pittsburgh and Kentucky lump and mine-run will be required, and bids will be received up to July 20. Last year the deliveries amounted to about 1000 tons. Address Secy. C. F. Leathers, Louisville Industrial School of Reform, Louisville, Ky.

+1076—New Cumberland, W. Va.—The Board of Education will receive sealed bids until noon, July 17, for furnishing coal to be delivered at the local school buildings. Address Secy. C. S. Bradley, Bd. of Edu., New Cumberland, W. Va.

+1077—Carlisle, Ky.—The County Board of Education will receive bids until 1 p.m., July 21, for furnishing the 10 schools in that district with red ash block Jellico coal or an equally good brand. Deliveries are to be completed during July and August. Address Lida E. Gardner, County Bd. of Edu., Carlisle, Ky.

+1078—Ionia, Mich.—The Board of Trustees for the Ionia State Hospital received sealed bids until July 13 for furnishing approximately 2500 tons of bituminous nut and slack coal. Bidders were required to submit an analysis of the coal and quotations were made f.o.b. cars on sidetrack at the hospital. Address Medical Supt. Dr. R. H. Haskell, Ionia State Hospital, Ionia, Mich.

+1079—Charleston, Ill.—The Charleston Union School District received bids until 5 p.m., July 13, for furnishing the various school buildings with coal. Deliveries are to be completed by Aug. 20 and about 400 tons will be required. Address Chn. F. M. Mealey, Fuel Com., Charleston Union School District, Charleston, Ill.

1080—Kansas City, Mo.—Morris & Co., packer, will let its yearly coal contract about the first of August. It uses about 750 tons of Cherokee slack per week during the summer months and 1200 tons per week during the winter months.

+1081—Frankfort, Ohio—The Board of Education of Concord Township will receive bids until 1 p.m., July 17, for furnishing 2200 bu. of lump coal. About 1500 bu. are to be delivered on track at Roxabel and the balance on track at Austin. Deliveries are to be completed by Aug. 5. The coal is to be screened over a 4-in. bar and must be forked from the car and weighed on wagon. Address Clerk, Board of Education, Concord Township, Frankfort, Ohio.

+1082—Sioux Falls, S. D.—Sealed bids were received until 9 a.m., July 12, for furnishing the City Water-Works Pumping Station with approximately 1000 tons of Wilmington screened lump coal, Youghiogheny No. 2 pool gas coal, dock-run or screened lump, Elkhorn, Ky., dock-run, or screenings. Bids are to include cost of delivery to the pumping station as required until Apr. 1, 1916. Address City Audr. Walter C. Leyse, Sioux Falls, S. D.

+1083—Richmond, Ind.—The Wayne County Commissioners will receive bids until July 17 for furnishing the various county institutions with coal during the ensuing year. Address Audr. L. S. Bowman, County Comrs., Richmond, Ind.

+1084—New Lexington, Ohio—Sealed bids will be received by the Board of Education at this place until 7 p.m., July 31, for furnishing the local schools with coal. Address Clk. C. O. Ferguson, Bd. of Edu., Pleasant Township, New Lexington, Ohio.

+1085—Wilkinsburg, Penn.—The Borough Government at this place received bids until noon, July 12, for furnishing the local schools with lump and slack coal. Address Dr. F. R. Stotler, Chn. Com. on Supplies, 611 Penn Ave., Wilkinsburg, Penn.

+1086—Clinton, Mo.—Sealed bids will be received until 2 p.m., Aug. 4, for furnishing the local Court House, County Jail and County Home with coal. Address Deputy Thornton Jennings, Clinton, Mo.

+1087—Wells, Minn.—The School Board at this place received sealed bids until July 10 for furnishing its coal requirements. Quotations were to be f.o.b. sidetrack at this place. Address Secy. E. O. Oren, Bd. of Edu., Wells, Minn.

+1088—New York, N. Y.—Bids will be received until 2 p.m., July 22, by the Department of Bridges of New York City for furnishing and delivering 250 gross tons of No. 1 buckwheat and 250 gross tons of mine-run for use on the Brooklyn Bridge. Further particulars can be obtained on application. Address Bridge Comr. F. J. H. Kracke, Municipal Bldg., New York City.

+1089—St. Louis, Mo.—Bids for supplying the local Water-Works with fuel requirements during the ensuing year will be requested some time in August. Lump and washed coal are used, and the plant consumes about $100,000 worth of coal a year. The department is considering the advisability of using screenings in the future. Address Board of Water Commissioners, St. Louis, Mo.

+1090—Columbus, Ohio—The Public Service Department will receive sealed bids until noon, July 27, for furnishing coal approximately as follows: Municipal Light Plant, 10,000 tons; Scioto River Pumping Station, 3500 tons; Garbage Reduction Works, 2500 tons; City Hall Building, 140 tons; Schiller Park, 50 tons; Water-Works Shop, 75 tons; State St. Yard, 25 tons; Goodale Park, 20 tons; Recreation Department, 70 tons. Blank forms and specifications can be had on application. All bids must be accompanied by certified check for not less than 10% of the total amount of the bid, and the successful bidder will be required to furnish a bond of 50% of the amount of the bid. Address Clk. Paul B. Kemper, Public Service Comn., Columbus, Ohio.

+1091—Beamsville, Ont.—The local School Board will receive bids until July 20 for furnishing the schools with anthracite stove coal. Deliveries are to be made in August. Address Secy. J. A. Sinclair, Bd. of Edu., Beamsville, Ont.

+1092—Muskegon, Mich.—Sealed bids will be received until 8 p.m., July 19, for furnishing the Fire Department, City Hall, Water Department and Poor Department with coal during the ensuing year. Address City Recorder B. H. Tellman, Muskegon, Mich.

+1093—Franklin, Penn.—Sealed proposals will be received until 5 p.m., Aug. 2, for furnishing the local City Government with approximately 2400 tons of three-quarter lump coal. Quotations should be made in carload lots, f.o.b. New York Central switch at pump station. Deliveries are to be as required and will be completed before Jan. 1. Address City Clk. J. G. Crawford, Franklin, Penn.

+1094—Fairfield, Iowa—Bids will be received until noon, July 19, for furnishing the local School District with 1200 bu. of coal during the ensuing year. Address Secy. J. W. Dole, Independent School District, Fairfield, Iowa.

+1095—Lynn, Mass.—The City Government will receive bids until 10 a.m., July 16, for furnishing coal as follows:

Franklin County stove, 50 tons; Logan, 100 tons; New River, 100 tons; white ash broken, 300 tons; white ash stove, 500 tons; white ash egg, 1000 tons; Cumberland, Pocahontas or George's Creek, 2000 tons. Deliveries are to be made as required during the fiscal year beginning Aug. 1. Address City Pur. Agt. Albert S. Carleton, City Hall, Lynn, Mass.

A. Suydam & Co.**, 12,000 tons same, delivered to the Court House and 215 tons delivered to the Memorial Bldg. and the County Morgue at $1.95. Address Clk. John Scott, Bd. of County Comrs., Columbus, Ohio.

✚**No. 844—Lexington, Ky.**—This contract (Vol. 7, p 1049), which provides for furnishing the local Board of Education with about 1000 tons of coal, has been let to the **Kinhead Coal Co.** on Cumberland lump coal at $2.85. This contract last year was let at $2.90. The coal is screened over a 2-in. shaker screen. Deliveries are to be made as required. Address Clk. J. H. Sinwall, Bd. of Edu., Lexington, Ky.

✚**No. 852—Canal Dover, Ohio**—This contract (Vol. 7, p. 1085), which provides for furnishing the Public Service Department with approximately 1500 tons of mine-run coal, was awarded to **Erwin Bros.** at $1.35 per ton. Other bids on this contract were George Gintz, $1.64; John Hartz, $1.59; Alonzo Gibbs, $1.45. Address, Dir. Osmond Salmond, Public Service Commission, Canal Dover, Ohio.

✚**No. 879—Peabody, Mass.**—This contract (Vol. 7, p. 1086), which provides for furnishing the local Electric Light Department with about 5000 tons of coal, has been let to **George W. Pickering**, of Salem, at $4.59 per ton for Pocahontas coal. Other bids on this contract were $4.67 and $4.70. Address Mgr. Warren D. King, Peabody Electric Light Dept., Peabody, Mass.

✚**No. 884—Ottawa, Can.**—This contract (Vol. 7, p. 1086), which provides for furnishing the County Jail and Court House with about 250 tons of anthracite egg has been awarded to the **C. C. Kay Co.** at $7 per ton. Other bids on this contract range from $7.25 per ton upward. Address County Clk. Charles MacNab, Ottawa, Can.

✚**No. 887—Binghamton, N. Y.**—This contract (Vol. 7, p. 1086), which provides for furnishing the City Government with coal, has been awarded to **Ford, Powell & Hammond** and **O. W. Sears & Son.** Bids of the various companies, including those to whom the contracts were awarded, were as follows:

	Egg	Chestnut	Stove	Pea	Bituminous	Buckwheat
Ford, Powell & Hammond	**$5.35**	**$5.57**	**$5.35**	$4.35	$3.45	$3.15
O. W. Sears & Son	5.55	5.80	5.55	**4.00**	**2.98**	**3.15**
Binghamton Coal Co.	5.70	5.90	5.70	4.70	3.20	
Charles McKinney	5.70	6.00	5.70	4.60		3.30
Economy Coal Co.	5.60	5.85	5.70	4.85	3.35	3.10
S. M. Elliott	5.40	6.00	5.40	4.20	3.30	3.15

Address Dept. of Public Works, Binghamton, N. Y.

✚**No. 919—Pontiac, Mich.**—This contract (Vol. 7, p. 1127), which provides for furnishing the local Board of Education with coal during the ensuing year, has been awarded as follows: **Gates Bros.**, West Virginia ¾ lump, $3.20; **J. L. Sibley Co.**, anthracite, egg and stove coal, $7 per ton. Address Secy. Elmer L. Webster, Bd. of Edu., Pontiac, Mich.

✚**No. 920—Lincoln, Neb.**—This contract (Vol. 7, p. 1127), which provides for furnishing the state institutions with coal during the ensuing year, has been awarded as follows:

	Price	Tonnage
BEATRICE (Institution for Feeble-minded Youth)		
Coal Hill Coal Co., Omaha, deep shaft, mill	$3.75	2000 or
Coal Hill Coal Co., Omaha, deep shaft, slack	3.55	2000
Coal Hill Coal Co., Omaha Range, Routt Co., Colo. nut	6.15	100

COAL AGE

Vol. 8 NEW YORK, JULY 24, 1915 No. 4

APPRECIATION

By MICHAEL BERNARD

With An Autocratic Air—

You, the men of strong opinions,
Who, from desk and swivel chair,
Issue orders to your minions
With an autocratic air,
Have you never paused a second
As you ruled your mining crew,
And with business judgment reckoned
What a word of praise would do?

You're the chaps that raise a ruction—

When, by some mischance, production
Takes a downward-trending course,
You're the chaps that raise a ruction
And condemn the working force;
But in case their zeal unending
Makes a record-breaking run,
What prevents you from commending
All the work that they have done?

Tell them plainly of the matter—

Do you fear misunderstanding
Of your meager words of praise,
And the men will come demanding
That you give them all a raise?
Don't attempt to puff or flatter,
Shun the bunk and blarney then;
Tell them plainly of the matter
As a man who speaks to men.

Still, they like to hear you saying—

Yes, it's very true you're paying
For their heavy toil's return;
Still, they like to hear you saying
That they're worth the wage they earn;
And when words of commendation
Crown their labor's weary close,
Then the cup of their elation
Brimming fills and overflows.

YOU CAN BUY *a man's exertions, yet you make him a machine*
When you base your whole relation on the crisp and crinkly green;
But the minute that you show him that you've red blood in your veins,
You have changed a bondsman's fetters into friendship's loyal chains.

Alternating-Current Machines for Small Coal Mines

By E. C. De Wolfe*

SYNOPSIS—A specific instance of where an old abandoned mine in thin coal was rehabilitated and its operation rendered a commercial proposition by the purchase of power, which is both bought and consumed as alternating current.

Cutting machines driven by alternating current find a field of special adaptability in placing the advantages of machine mining within the reach of small mines for which the expense of a complete power plant seems unwarranted. As one example of such application can be cited the American Cannel Coal Co., at Cannelton, Perry County, Ind., on the Ohio River.

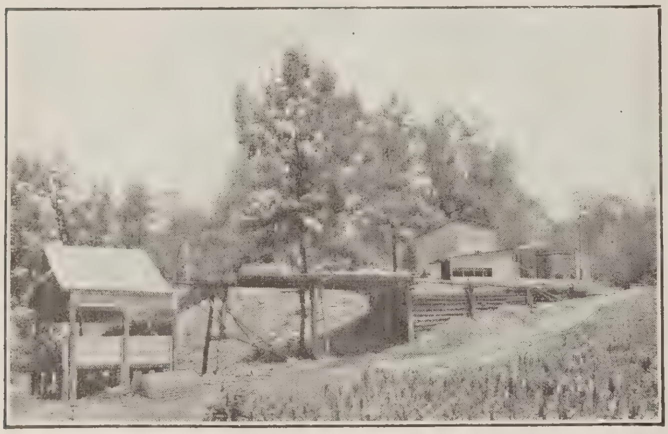

FIG. 1. THE TIPPLE AT THE "GOPHER HOLE"

Here, by installation of a modern item of mine equipment, there has been rehabilitated one of the oldest mines in the oldest mining district of Indiana. The Geological Survey is authority for the statement that Perry County coal was taken by Robert Fulton aboard the steamer "Orleans" on its first trip down the Ohio River in 1811. First attempts at commercial mining were made in 1837, when the American Cannel Coal Co. was incorporated by act of the Indiana General Assembly "to mine stone coal at Coal Haven," which afterward became Cannelton. A total area of 6456 acres was acquired by various purchases, and in sale of surface for other uses the mineral rights were always retained.

Severl mines were opened and coal was hauled in rude cars, on strap rails, over a wood trestle tramway to the river, where a tip deposited the coal upon a floating platform. "Here," says James De la Hunt, Perry County's historian, "a large painted sign called the attention of passing steamboats to the new fuel, lauding its merits as a steam producer and urging its cheapness." The boats all burned wood, and the adoption of coal was slow, yet steady, and the company built up a good trade. During the Civil War river gunboats were fueled with coal from these mines.

Some of the early openings were abandoned as distances and thinning of the seam made working impractical, or unremunerative with the changes in market conditions in later years. It is at one of these abandoned openings, wherein the coal had thinned to impracticable height for hand mining, that a Goodman alternating-current shortwall machine has been placed in service, giving the mine a new "lease of life" and enabling the company to push ahead into otherwise lost territory, where the coal runs as low as 24 in. in thickness.

To install a complete power plant at this little "gopher hole," as Secretary Shallcross modestly terms the present mine (Fig. 1), would be obviously prohibitive in cost and operating expense. To purchase the only available commercial power—alternating current—and convert it to continuous current for driving a machine of that type would involve installation of converter equipment. This would result in a higher cost and lower efficiency than for static transformers to step down the high-tension transmission line voltage for mine use.

Hence the alternating-current shortwall machine, run by purchased power, received over an economical transmission line and reduced to operating voltage by simple means, involves no attendance charges. Power costs are thus made low and always directly proportional to machine productivity.

Cutting Is Done Below the Coal

Underlying the coal is a hard fireclay in which the cutting is done, the difficulties of its hardness being offset by the advantages of gaining the necessary height for working and of saving the entire coal seam for loading out in good-sized pieces. The fireclay is so hard that, except in local soft spots, it is known by the men simply as "rock."

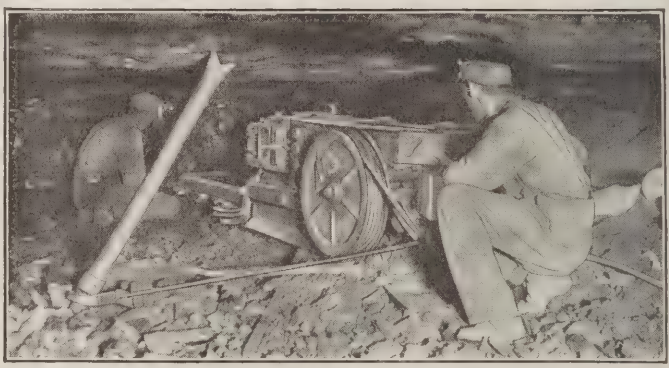

FIG. 2. ALTERNATING-CURRENT MACHINE AT WORK

Cutting beneath the coal the machine makes a bottom 6 in. below the seam, giving 30 in. of working height where the coal is 24 in. thick. On its special low drop-axle truck the machine enters easily the low rooms, though in some places the ties have to be embedded into the bottom. Roofs on the entries are brushed to give traveling height for the mules.

The drop-front feature of the Goodman truck enables unloading even when the machine may be rubbing the roof. Unloading, running cuts and reloading are all equally easy. Of particular importance, however, is the tilting shoe with which the machine is fitted and by means of which the runner is able readily to control the cutting, to keep the machine just so far beneath the coal and make it leave a good bottom.

---

*608 Dearborn St., Chicago, Ill.

Rooms are worked 30 ft. wide and 225 ft. deep, with 9-ft. pillars through which five 12-ft. breakthroughs are cut, giving about 85 per cent. recovery from the working as a whole. Coal is loaded into 1-ton cars and hauled out by mules over 42-in. gage track laid with 16-lb. rails. Room curves have 15-ft. center radius, on which the operation of the machine is facilitated by the independent cable-reel trailer truck.

Three-phase current is transmitted to the mine at 2200 volts and stepped down to 220 volts for the mine circuits and machine use. The mine leads are heavily insulated and substantially hung along the rib on the entries. The machine is mechanically of standard shortwall construction, with only the electrical parts arranged for use of alternating current.

The American Cannel Coal Co. is only one of many small and moderate producers that have installed alternating-current mining machines of various types to good advantage under their own peculiar conditions.

German Coal Industry in 1914

In 1889, 25 years ago, the German coal production amounted to 67 million tons. The largest production was reached in 1913 with 191½ million tons, dropping in 1914 to about 161½ million tons, being a decrease of 30 million tons. The reduction affected the states as shown in Table 1.

The production of brown coal in 1914 amounted to 83.9 million tons, being a decrease of 3.2 million tons, or 3.64 per cent., as against 1913, which production still exceeds the output in 1912 by approximately 3 million tons. The production of brown coal in the various states was as shown in Table 2. The decrease in production in 1914, amounting to 33.1 million tons, or 11.9 per cent., compares with the English loss in production of 40 million tons or 15.16 per cent.

In the district of Upper Silesia a brisk demand for all grades is reported. The approach of warmer weather has not, as usual, caused a decrease in the demand, as dealers who as a rule reduced their spring orders by 50 to 60 per cent. endeavor to close summer contracts in undiminished quantities. The coal combine, however, is not inclined to comply with these demands, one reason being to prevent speculation and the other to consider in the first place manufacturing industries and gas works of central and northeast Germany, which now depend exclusively upon the Upper Silesian production. Regular customers, however, are served as before.

TABLE 1. COMPARATIVE GERMAN COAL PRODUCTION IN 1914 AND 1913 IN 1000 METRIC TONS

State	1914	1913	Loss (%)
Prussia	153,006	181,413	— 15.66
Saxony	4,836	5,471	— 11.61
Bavaria	660	811	— 18.62
Alsace-Lorraine	2,857	3,796	— 24.74
Other districts	176	20	+ 880
Total	161,535	191,511	— 15.65

TABLE 2. COMPARATIVE GERMAN PRODUCTION OF BROWN COAL IN 1914 AND 1913 IN 1000 METRIC TONS

State	1914	1913	Loss (%)
Prussia	67,424	70,256	— 4.03
Saxony	6,298	6,312	— 0.28
Bavaria	1,601	1,895	— 15.52
Hesse	402	429	— 6.30
Brunswick	2,235	1,824	+ 22.53
Saxony-Altenburg	4,797	4,910	— 2.30
Anhalt	1,180	1,474	— 19.95
Reuss	10	12	— 16.67
Total	83,947	87,116	— 3.64

Deliveries on contracts are made promptly, and in spite of lack of labor the output approaches 68 per cent. of the normal production, thus complying with the domestic demand, besides furnishing 100,000 tons monthly to Austraia.

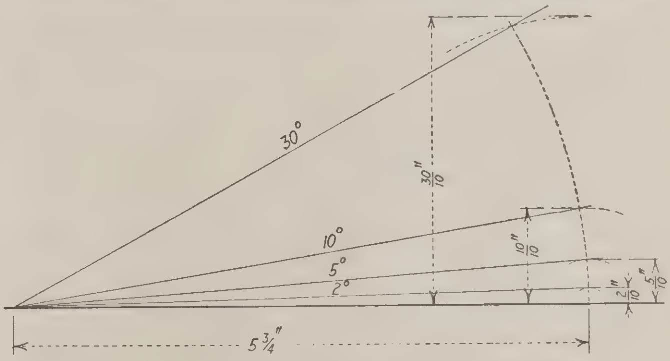
The export from the Upper Silesian coal district amounts now to 6 per cent. normal production, as compared with 38 per cent. in normal times. Provision has been made for a considerable reserve in coal in order to safeguard the necessary requirement for the industries, in case the political situation should cause a further reduction in the output.

Inquiries for delivery are reported from Holland, but which under the circumstances cannot be considered, as all surplus quantities are being reserved for the Austrian market.

Laying Out Small Angles

Francis W. Shaw in the *American Machinist* describes a simple but accurate method of laying out small angles in the absence of a good protractor or drafting machine. As much accuracy is obtainable in this method of plotting angles as is secured when an ordinary protractor is used. Theoretically the error in laying out an angle of 1 deg. by this method is but 4 sec. With an angle of 10 deg. it is less than 1 min., and even a 30-deg. angle can be determined in this way with an error of only 13 min.

From the base line draw an arc of 5⅜-in. radius and lay out the desired angle along this arc, setting the compasses or dividers to $\frac{1}{10}$ in. for every degree. Join the center of the large arc with the points determined on its perimeter.



MANNER OF LAYING OFF ANGLES WITHOUT A PROTRACTOR

For angles approaching 30 deg., lay out an angle of 30 deg. with the triangle and add or deduct the small angle of difference. For angles near 15 deg., bisect an angle of 30 deg., adding or deducting the difference in angle.

* * *

Chinese Mining Superstitions—Although the Liao Yune district in Mongolia is hilly, there are no mountains where mining operations may be carried on. This is due to the fact that the mountains which may possibly contain minerals are considered sacred by the Mongols, and therefore out of reach of mineralogists. Should any construction materials, such as sand or stone, be required for repairing roads, etc., they must be obtained from districts well removed from these mountains.

Pea Coal--An Outlaw Size

For several months past the wholesale prices in the anthracite market have been badly unsettled. There has been a wide divergence between the prices as shown on the circulars issued and the actual selling prices, particularly as regards pea coal. The low market value of this grade has been due to nothing more than a natural adjustment to an inevitable condition. As is well known, pea and all the smaller sizes are byproducts pure and simple; in other words, these sizes are not made by design, but happen in the production of the so-called prepared or domestic grades. The production of pea ranges from 10 to 40 per cent. of the entire output, the variation depending on the hardness of the seam from which the coal comes and the percentage of larger sizes for which the breaker rolls are adjusted. A fair average would be 22 per cent.

In the beginning of the anthracite industry pea and the smaller sizes were regarded as waste products. Finally a market was developed for them as steam fuel, but in addition pea began to find quite a place for itself in the domestic market, because of its low price as compared to the next nearest domestic coal; the operators, however, tried to discourage its use as a family coal, insisting that it was only a steam fuel.

With the natural advance in price of all commodities during the past 10 years, pea coal experienced a raise proportionate to the other sizes, which made its price as a steam coal, in competition with bituminous, practically prohibitive. As a result there is now less than 1 per cent. of pea coal being used for steam purposes, and while the smaller sizes still maintain their position as steam coals, almost the entire tonnage of pea is left to be absorbed as best it can. The only market left for this grade is naturally the domestic or family trade, and it has now become eminently a family size and must be so considered. It will probably continue a family coal exclusively unless the operators are willing to make an attractive offer to steam consumers. This would certainly tend to stabilize the market on all sizes and would help to prevent the unsettling conditions due to price cutting on this grade.

⁂

How to Repair Steel Tapes

Many engineers and surveyors repair their own steel tapes, the repair outfit consisting of a combined punch and rivet set and copper rivets or eyelets. Few know how to repair a broken tape properly, even when furnished with all the necessary facilities, says *Engineering News*.

The point which needs the most emphasis is that no matter how it is broken some of the original tape must be cut away and a new piece spliced in. This applies both to graduated ribbon tapes and to most of those made of heavy flat wire. Any mend which stiffens the tape at the splice weakens it and makes it more likely to break near there a second time, especially in the case of thin ribbon tapes. The only exception is in repairing heavy wire tapes, 1/8 in. wide or less, which are usually so stiff that they can be mended with a soldered sleeve.

In Fig. 1, tapes Nos. 1, 2 and 3 illustrate defective splices. No. 1 is made by lapping the tape by 0.12 ft. and securing the lap with six eyelets. A little consideration would have shown that two eyelets and a 0.02-ft. lap would have done just as well.

No. 2 is another lap joint a little over 0.1 ft. long. In No. 3 the whole of the old tape has been retained and the repair made by riveting a piece 0.15 ft. long on the back. Solid rivets have been used, though eyelets would have been preferable. Nos. 2 and 3 also illustrate defective methods of fastening on the end rings—the laps for that purpose are too long. However, the handle in No. 2 illustration would be correctly fastened if the laps were shorter, for two eyelets have been used to secure the lap, and that is the correct number.

Nos. 4 and 5 show conscientious and ingenious attempts to assure flexibility, but by means not to be recommended.

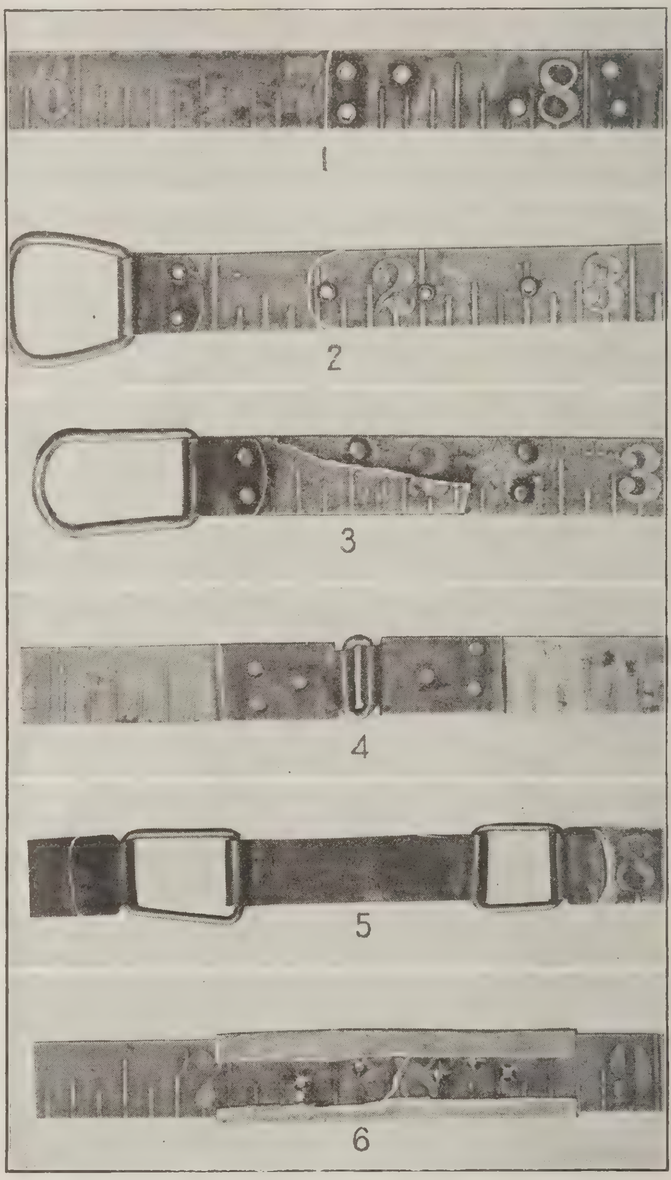


FIG. 1. "HORRIBLE EXAMPLES" OF TAPE REPAIRS

No. 6 is a crude but effective repair, no doubt made in camp. The sleeve was probably cut from a tin can, and it is likely that a nail was used for a punch, the motive power being furnished by blows of an ax. There are no rivets, and the sleeve holds by depressions punched partly through the tape.

In Fig. 2 is illustrated the proper way to make tape repairs. First punch two holes in each of the broken ends 1 in. or more back from the break. Take a piece of tape about 2 in. longer than the completed splice is to be, lay one of the broken ends on the splice, tying it tightly to insure proper alignment, and punch holes in the splice through the holes already punched in the tape, placing and setting a rivet as soon as a hole is punched. Solid rivets are used for flat-wire or band tapes, and when the tape is $\frac{1}{4}$ in. or less wide, the rivets are placed in tandem, as shown in No. 1, Fig. 2. After the splice has been riveted to one end of the broken tape, lay the other broken end on it and butting the two ends of the break together, tie it in place and rivet as before. When all rivets are driven, notch the ends of the tape close to the rivets with an edged file and break the tape on the file marks. In the same manner notch and break off the ends of the splice close to the rivets. The result is a lap of not over 0.03 ft. for a tandem splice and a little over 0.01 ft. (or $\frac{1}{8}$ in.) for rivets side by side, which means a tape practically as flexible as if it were new. For thin ribbon tapes eyelets should always be used instead of solid rivets, as shown in Nos. 3 and 4, Fig. 2.

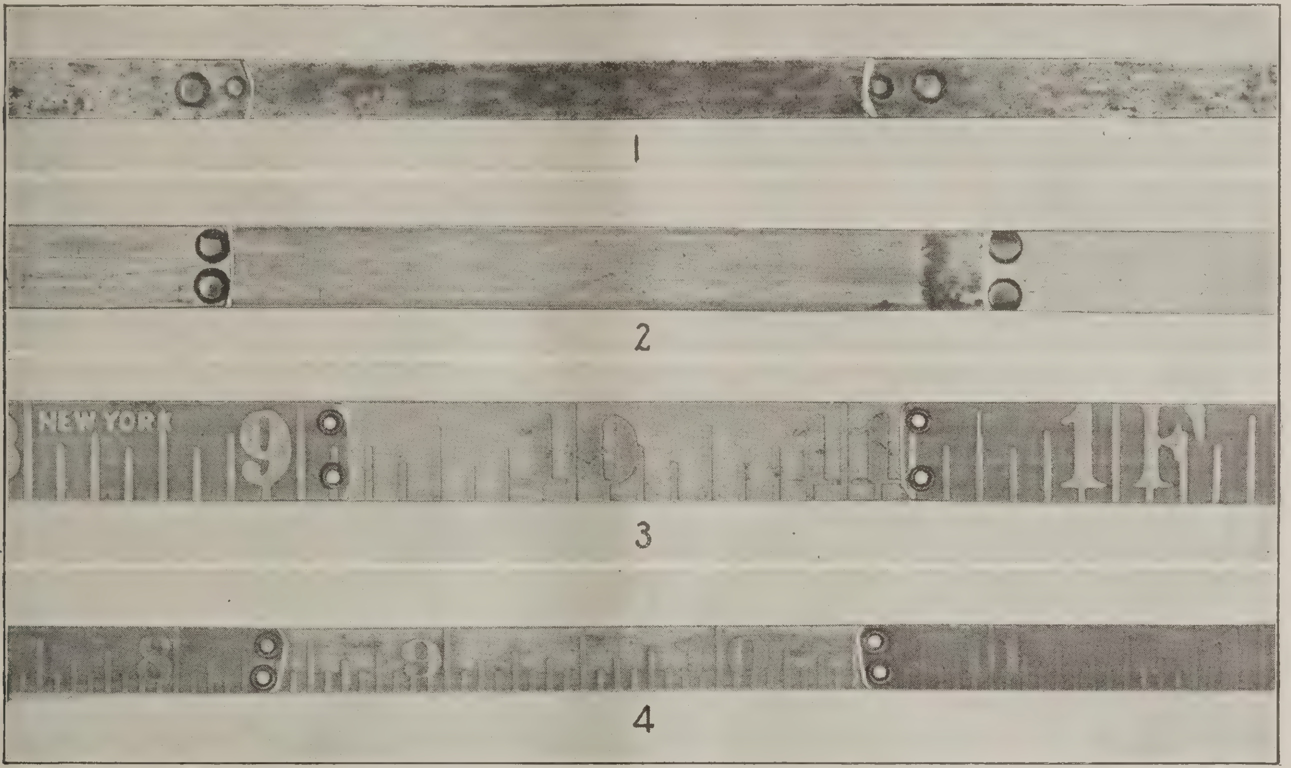

FIG. 2. EXAMPLES OF TAPES REPAIRED SO AS TO PRESERVE THE MAXIMUM FLEXIBILITY

To replace a broken ring or repair a tape broken at the ring, take a piece of similar tape showing any foot mark. Lay the ring with its clip or sleeve in place on this splice-tape, and hold it there by slipping a narrow piece of tape (or wire) under the splice-tape and over the ring (see Fig. 3). Punch one hole through the ring clip and tape, separate, and cut the tape close to the hole; insert the clip, and rivet, using a long eyelet. Then punch the second hole and rivet as before. Notch the clip with a file close to the eyelets and break it off on both sides of the tape. Rivet the new section to the broken end, not less than $2\frac{1}{2}$ in., or 0.2 ft., from the end, being careful to lay the new piece on top of the old tape.

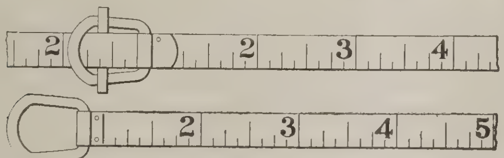

FIG. 3. HOW TO PUT THE RING END ON A TAPE

Indiana Mines Yield More Than 16,000,000 Tons of Coal

In 1914 the mines of Indiana yielded 16,641,132 tons of coal, having a value of $18,290,928, according to a statement by C. E. Lesher, of the Geological Survey. This shows a decrease from the 1913 figures of 524,539 tons, or 3 per cent. in quantity, and $710,953, or 3.7 per cent. in value.

Out of 19 coal-producing counties in Indiana 6 showed an increase in 1914, all the increases being small except that in Vigo County, which in 1914 had an output greater than in 1913 by more than 530,000 tons. On the other hand, the neighboring counties of Greene, Clay, Knox and Parke each showed a decrease of over 100,000 tons. The average price per ton for the state was $1.10.

There was no decrease in the proportion of the product shot off the solid, the figures being 5,175,229 tons in 1913 against 4,968,065 tons in 1914, approximately 30 per cent. in both years. The quantity of hand-mined coal decreased from 11 per cent. to 10.6 per cent. in 1914, and the number of mining machines in use increased from 732 in 1913 to 751 in 1914.

The Bureau of Mines reported 44 fatal accidents in the mines of Indiana during 1914, a decrease of 22 from those reported in 1913. This brought the death rate per thousand from 2.97 in 1913 to 1.97 for 1914.

⁂

Higher Coal Prices in England

The West Yorkshire Coal Owners' Association on June 1 advanced household fuel 81 cents per ton and industrial fuel $1.46 per ton, says *Commerce Reports*. The prices are now $2.67 for pea-slack, $3.40 for rough slack and $3.89 for nut at the pit. The *Yorkshire Post* states that the enhanced prices make the industrial situation a difficult one and that still another advance is hinted at.

Why Are Strikes at Coal Mines of Such Frequent Occurrence?--II*

By Hugh Archibald†

SYNOPSIS—The policy of coal operators has too often been to build poor houses and make undue profits from them. This has led the miner to believe that he is the victim of every kind of injustice. The miner needs the union. If the union is not what it should be, the faults are not inherent in the organization, but are merely incidental.

One of the causes for the frequency of strikes is the company house, on which the miner feels undue profits are made. It hardly needs argument to prove that there is a desire in every man to live decently. The "hunkies" and foreigners who come to this country do not have as high a plane of living as those who have been here a long time. But the foreigner soon acquires the desire to live on a higher plane and will readily admit this as a fact.

I have heard one Polander who had been here only 15 years explaining that the reason why a certain compatriot's scale of living was low was because the man had been in America only a couple of years. This fact is recognized by the management of many companies, and good work is being done in improving mining towns. It is a movement that comes second to the safety-first propaganda, but it is not as general or as thorough as it might be. In many places much talking is done, but little actual work is accomplished, only enough to make a superficial compliance with a fashionable fad.

It should be a distinctly recognized factor that mining differs from manufacturing in that the whole life of the community is dependent upon the management of the mine. In manufacturing there is not that absolute dependence.

In the first place, mining is the winning of raw material and must be carried on at the point where the material is found. On the other hand, a factory can be located at any central point where raw material can be brought to it conveniently and where the finished product can be readily shipped away. The location of such a plant does not need to be moved as the sources of its supplies change, and there is no limit to the length of its life, for the products it uses and produces vary with necessity.

Operators Must Build Houses

The life of a mine is limited, and when it is ended no other mine in the same neighborhood will take its place. As a result a mine is a temporary installation; nothing is built in coördination with its activity, and the mine worker is largely isolated from workers in all other lines. Frequently a mine is situated at the end of a branch railroad away from the main currents of travel and thought. This would tend to cause the community to retrograde, but the tendency is offset by the short length of life of the mining town and the frequent coming and going of its inhabitants.

On account of this isolation it is necessary that towns be built where mines are opened. Factories, on the other hand, are erected where communities have been already established, and in such places there are persons outside the particular industry who make it a business to build and rent houses at the mine.

The houses must be erected in the beginning by those who develop the plant, for it is not to be expected that a workman will come to any place with enough capital to build his own house. Nor is it to be anticipated that he will invest in immovable property when the returns in that investment are dependent upon his retaining work in a certain mine.

Miners Prefer to Build Their Own Homes

Where in any community there are a number of mines run by different companies, so that a workman can feel reasonably sure of getting work in another place should he lose it in any one of them, then it will be found that he will build his own home, putting forth an effort to make for himself a place where he can live contentedly. And it will be generally found that where a man owns his residence, it is a better, cleaner place than when his dwelling is a house rented from a company. The change in some parts of the anthracite region with the disappearance of the rows of company houses is an instance of this.

The necessity which has led to the building of towns has often led to abuses in the end. For it is too easy to discover that money can be made on what has been invested in the houses.

It is true that no capital should be invested without a return being sought. But as the number of mines increases in any neighborhood, the opportunity for a workman to live in a house not owned by the company will increase. And thus when a man applies for work, the first question asked of him is, "You take house?" If he does not "take house" then he does not get work. And a superintendent who does not force the men to live in the company houses, no matter how badly out of repair they are, is likely to lose his job.

And as there is compulsion to make a man live in a company house the care of such houses is often neglected —more grievously than the man in charge of the houses often realizes himself. This is quite in contrast to the principle of merchandising good goods at a reasonable rate, which is the rule of a modern store. The temptation exists under these conditions to try to obtain a large return on the money invested in houses.

And the reaction from this manner of making money crops out in the mine. It spreads through all the intercourse between those who are trying to make money on an investment and those who are seeking to make money by their labor. When it becomes patent to the workmen that a good profit is being made at their expense in the renting of houses or any other line, they naturally resent it, and so in their work they "loaf" as much as they can in order to try to make up in one direction what they lose in another.

"Do others, for they do you," may be a first principle of business and one that may work out successfully for a merchant who deals only once with any one person, but as a principle for application in a mining community, where the intercourse between a company and its men is continuous and not only involves the man himself, but his family as well, it is false and unreliable. It is a principle from which only trouble can be expected and one that will cost money in the end.

---

*The previous article is contained in the issue of July 10, 1915, pp. 48 and 49.

†Efficiency engineer, Scranton, Penn.

Some months ago a superintendent was telling what he was doing and boasting that he had all his houses rented. "You know," he said, "even my sand house is rented to two men." These employees may not have been able to express the feeling that the only interest the boss had in them was to make money out of them, and just as much money as was possible, but they felt it nevertheless. This thought affected not only those who lived in the sand house, but all the others—even those who may have been living in good houses. In return when any chance came to attack the company and turn the tables, it was entered into with joy.

Many people are discouraged because there is not an immediate response to any attempt they may make to do betterment work. The cleanliness of a New England village is a matter of long growth, and with the inhabitants of a mining village there are long years of neglect behind, in which prejudices have become fixed which can be eradicated only by living them down. A quick response is not to be expected and results cannot be hurried. They must grow.

Should Not Be Discouraged by Slow Results

It must be remembered that there is no encouragement for the men to respond. For the length of habitation of any man and his family is dependent upon the whim of a monarch—the boss. A man may be able to please the boss for years and hold his job, and yet again a mistake may arise the next week and he would lose it.

The house he lives in must then be vacated; so why make any improvements? They are fastened to the soil and cannot be moved when he is forced to go away. If he moves, his labor is wasted and will go to the next tenant, and in the next town to which he goes he will probably have to rent a dirty house and begin improvement work all over again.

Those who are trying to make their own mining communities better places for living and who feel discouraged may renew their flagging spirits with the thought that their numbers are continually increasing. But they will have to stand alone until the whole mass of the mining fraternity has for an extended time earnestly assumed its responsibilities, for such responsibilities it certainly does owe to the communities which are dependent upon the coal industry. By that time the distrust and irresponsiveness of the mine worker will disappear. Meanwhile, any individual operator if he would counterbalance the indifference of the rest, must work hard, for one cannot pass through a plague and escape infection from without except by taking unusual precautions.

Need for Mine-Workers' Union

Another cause for strikes is the desire for a recognition of the union. The desire of the men to confederate should be viewed in a different light from that which is now customary. There is a real need for some such organization as the United Mine Workers of America. It is not the first time in the history of our civilization that unions have existed. The Greeks and Romans were troubled with them and had to surrender to their importunities. The work in all the countries of Europe throughout medieval history was performed by unionized workmen, and English labor has been helped by them.

They have not always been known as unions. The organizations had other names or no names at all. At least the names of many of these bodies have not come down to us. The causes for which they struggled and the manner in which they were constituted have changed from age to age, but the underlying purpose is the struggle of the mass of the people for a better life. But as the desired ends were attained, the organizations have passed away only to become a memory. It will be the same with "the union."

It is interesting to note that in London in the year 1517—almost four hundred years ago—occurred "Evil May Day," which was so called because a strike riot occurred on that day for which 12 rioters (apprentices) were hanged and 400 more pardoned with the rope around their necks. But such doings did not remove the causes of discontent nor end the turmoil. An account written at the time gives the same causes for the riot as we find assigned for riots today. It says:

> Before May Day, poor handicraft people which were wont to keep shops and servants and had labour and living by making pins, points, girdles, gloves, and all such other things . . . had thereof sale and profit daily, until thirty years ago. . . . Many rich men is risen upon the destruction of the poor people, which poor people perceived themselves as having no living . . . not able to keep no houses . . . but in alleys sitting in a poor chamber working all the week to sell their ware . . . which would not give them so much winning for their wares to find them meat and drink.

And it is interesting, moreover, to know that among the other causes for the riot was a protest against foreign labor which was lowering the scale of living. Those who are working in mines are so close to the daily struggle that it is hard for them to get a perspective view of the situation. So it is excusable but nevertheless wrong for mine managers to condemn the union without qualification. It is true, the men blindly follow ignorant and self-seeking leaders and that those leaders become arrogant when they feel the strength of the union behind them. But the trouble is with individual men and not with the organization as a whole. The shoe is on the other foot when the unions condemn corporations. Corporations and unions are not animate things and are only as good as their thinking managers.

The basic desire underlying the formation of the United Mine Workers of America and the thing that holds it together is the desire of the individuals for a higher scale of living than they now possess and a chance to earn that living. When agreements between managements and men are in process of formulation this desire is given expression, in the form of one demand or another. But it is by playing upon the basic desire and by dressing it in different forms that the leaders hold the men together and can lead them to strike for the granting of their demands. But were these intense desires not there, the men could not be led into strikes.

Union a Nuisance and the Grievance Committee an Insult

The man at a mine generally looks upon the union as a nuisance and the grievance committee as an insult. The man in the nonunion districts can give orders without any explanation of why they are issued, nor does he have to worry if a man is idle for a week or so after his place is finished before he is given another. He does not have to trouble about the equal turn of cars. He can make the men live in the company houses and trade at the company store, no matter what treatment they receive.

The only recourse the men have is to go to some other place for work. It is a consummation of the idea that the boss is boss and what he says must go and go in a hurry. That is the principle of an absolute monarchy. But as monarchies in the state have gone down before democracies, so too it is now generally admitted that there is a growing democracy in work, though its realization is a long way off. Yet the man who will acknowledge this and give explanations of why he issues orders to a group of men is more likely to get along in peace with that group than he who tries to rule autocratically.

The grievance committee, instead of being considered an insult and a body of loafers about which to complain loudly, should rather be welcomed by any boss who is earnestly trying to treat his men with justice. He should regard it as a needful check upon himself and a guarantee that he will not fail to do his duty to all his employees. It is only too easy, as I know from experience, to forget this obligation and to neglect a man, leaving him without a place or opportunity to work.

The grievance committees are often composed of men with whom it is hard to argue. They may be and often are men who seek a place on the committee merely to further their own purposes. They may be loud-mouthed demagogues. That is not a basic fault of the union, and an attack should not be made on it in general, but upon the individual, efforts being made meanwhile to get honest men on the committees.

Operator Is Unheard Because He Says Nothing

When an agitation is being made in one direction it can only be met by one in the opposite direction. Too little of this is done. A mason's helper drifted into my office one morning on an idle day, and I talked with him. He told me about himself—that he was a socialist and a former member of the Industrial Workers of the World. I found he knew the works of Marx and Mills and others. In fact he was remarkably well-read. Telling me about meetings among the mass of workmen and how the I. W. W. sent out professional speakers, he said: "I go and argue against them. For what can these poor people do? They are ignorant and cannot prove that what is said is wrong. I go to the meetings and debate with them, and they listen to me and believe me." And he ended, speaking of the people in general, "They will listen if you speak to them."

That is it. No manager meets his workmen on a common plane. The commonly accepted philosophy of life says that one must hold one's dignity and be a boss rather than a leader of the men. We think that the men won't recognize one who is attempting to be a leader and will abuse his efforts. But it does not follow that when one relinquishes the position of autocratic boss, one softens one's muscles. The man who would lead needs more strength of character than a mere tyrant. A weak man will have more success as an autocrat than as a leader.

In the previous article I have spoken about the inequality of the miners' pay and the way it is reduced by an inadequate supply of mine cars. In this article I have discussed the house question and the attitude of the operators toward the union. These three elements in the relation between operators and men are bound up with one another and cannot be considered separately. If the questions that each raises are regarded with the same old philosophy of life—the philosophy of a chattering monkey swiping coconuts from his companions—no solution can be obtained. This is the philosophy that "business is business and the devil take the hindmost." It is the expression of the idea that no one can advance except at the expense of his fellowman.

But there are any number of good old proverbs that proclaim a different philosophy. E. H. Gary, of the United States Steel Corporation, announces a more reasonable doctrine in a recent number of *Harper's Magazine*, and it is to be hoped that his example will be followed throughout industry. Countries have been struggling for hundreds of years under the old negative philosophy which argues that capital should forbid labor a voice in its control, and with all their boasted progress they have to admit that the same demonstrations are repeated over and over again. Under a new active philosophy of labor betterment, better conditions are to be expected.

⁂

Virginia Has Good Coal Year

The production of coal in Virginia in 1914 was 7,959,535 short tons, valued at $8,032,448. This was 868,533 tons less than in 1913, with a decline in value of $920,205, yet the output was greater than in any year previous to 1913, according to the figures compiled by C. E. Lesher, in coöperation with the Virginia Geological Survey, and just made public by the U. S. Geological Survey. The decrease in quantity was 9.8 per cent. and in value 10.3 per cent. and is attributed to the smaller demand from the iron business for coke. and to the smaller quantity needed to meet the requirements of the railroads and cotton mills.

For several years Virginia has stood relatively high in the quantity of coal produced by each man employed, and 1914 was no exception to the rule. The number of men employed in the coal mines of the state increased from 9162 in 1913 to 9183 in 1914, and the average working time decreased from 280 days to 235. The average production per man in 1913 was 964 tons and in 1914 was 868 tons. The average daily production per man was greater in 1914, being 3.59 tons against 3.44 tons in 1913.

⁂

Coal Production in Oregon

In 1914 Oregon produced 51,558 tons of coal, valued at $143,556, an increase of 5495 tons over the output of 1913, according to the Geological Survey and the Oregon Bureau of Mines and Geology with which the Survey coöperates. The only productive coal field in Oregon is in the southwestern part of the state, in Coos County, and known as the Coos Bay field. Other coal fields have been prospected in different parts of the state, but none has been developed to the point of production. .

Coal production has never been one of the important industries of Oregon, and during the last few years has been of less importance than formerly because of the large increase in the production of petroleum in California and in its use as fuel. In only four years has the production exceeded 100,000 tons, and in each of the three years preceding 1914 it was below 50,000 tons.

Automatic Incline Devices

By Ralph W. Mayer*

SYNOPSIS—Some of the safety devices employed on a 4000-ft. slope of the Roslyn-Cascade Co.'s mine No. 1. These safety stops, derail switches, etc., are for the most part entirely automatic in action.

The Roslyn-Cascade Co., of which William McKay is general manager, lowers the coal from its mine No. 1 down an incline about 4000 ft. long, which crosses several gulches on high trestles and runs through several short tunnels to the tipple. As a runaway trip on this incline would do costly damage and be dangerous to human life, all possible safeguards have been adopted. In most cases these have been made to work automatically.

The loaded cars going down pull up the empties. The cable, at the top of the incline, passes several times around either half of a double drum placed horizontally. Strong brakes on these drums, both operated by one lever, regulate the speed at which the cars travel.

The shaft of a small engine, which is also used to hoist cars from the top of the incline into the mine, has a sliding miter-geared wheel, which can be thrown into mesh with a gear wheel, on the circumference of one of the drums, if it becomes necessary to use power for hoisting material up the incline.

A three-rail double track is used on the upper half of the incline, from the knuckle to the turnout where the trips pass each other.

Stop-Blocks Are Placed at the Knuckle

Automatic stop-blocks are placed at the knuckle. These are two in number—one in the middle of each track. Each stop-block is made from two timbers framed together side by side, one timber next each rail, and of the necessary strength to stop a runaway trip or car. These timbers move up and down vertically between the rails. Their ends are iron shod.

One heavy timber placed across and underneath the track on the upper side of these stop-blocks at their bottom end and another on their lower side directly underneath the rails prevents a runaway trip from moving them. The stop-blocks slide up and down against and between these timbers.

Several timbers placed lengthwise between the rails, and fastened with drift bolts to the ties, directly below the stop-blocks, materially strengthen them.

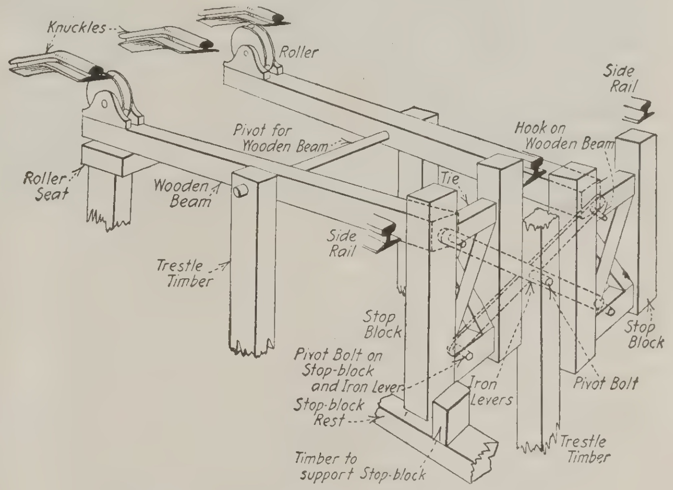
The stop-blocks are made to operate automatically by placing a roller for the cable on the knuckle between each track. The frame in which this roller revolves is set on the end of a 4x10-in. timber, about 6 ft. long, placed lengthwise with the track and underneath it. This beam is pivoted at its middle so that its ends are free to swing up and down, the pivoting bar being fastened to the timbers of the trestle underneath the knuckle.

A support or seat, underneath the end of the beam on which the roller is fastened, prevents it from dropping more than 4 or 5 in. and takes all the weight of the cable pulling down on the roller.

The other end of the beam is provided with an iron hook which engages the eye of an iron lever. This end of the beam is also weighted down by means of several old car wheels firmly clamped to it. The iron lever is placed crosswise to and reaches from center to center of the tracks. A pivot in its middle allows both ends to swing up and down.

The other end of this iron lever is pivoted by an iron bolt to the bottom of the stop-block frame, which is on the opposite track from the one under which the wooden beam and roller is placed. The up-and-down motion of the roller on the one track raises and lowers the stop-block on the opposite track.

The car-wheel weights on the end of the wooden beam must be sufficiently heavy to pull one end of the iron lever down and thus raise the stop-block which is fastened to the other end of this lever. When the roller is depressed by the downward pressure of the pulling cable, the stop-blocks are lowered. When there is no tension on the cable, the weights on the end of the wooden beam raise the roller and the stop-block on the opposite track.



STOP-BLOCK PLACED AT THE KNUCKLE

The levers, etc., under each track are duplicates. The iron bar on which the wooden beam swings must be placed a sufficient distance from the roller to allow the other end of the beam to swing far enough to lower the stop-blocks clear of the cars when the roller is depressed.

Rests are placed underneath the stop-blocks to hold them when they have been sufficiently depressed to clear the cars.

An Auxiliary Stop-Block Is Employed

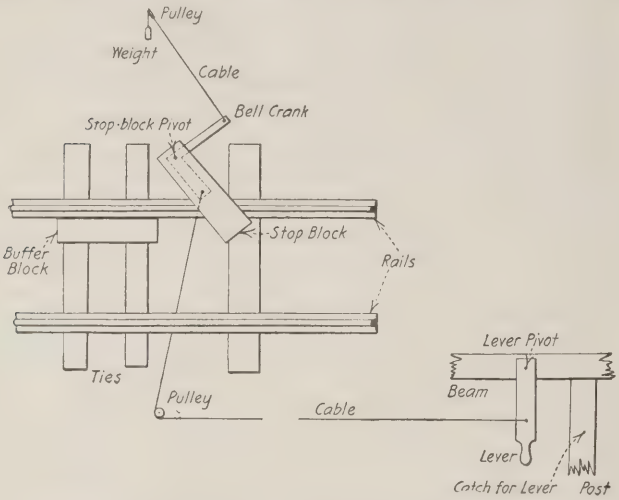
An auxiliary stop-block is placed over the middle rail, above the automatic device. This is made by taking a 6x6-in. timber about 2 ft. long and hinging one end so that it will swing horizontally over the rail.

This piece of timber is well ironed. An iron pin passing through one end and down into a heavy tie furnishes the pivot upon which it may move. When it is swung across the rail, the other end comes in contact with the end of a timber or block thick enough to reach about 4 in. above the rail. This is laid lengthwise of the track and spiked to the ties. This holds the timber firmly in position across the rail for the car wheel to bump against.

---

*Mining engineer, Roslyn, Wash.

A bell crank is fastened to the bottom of this pivoted timber on the pivoted end. From one arm of the bell crank a cable or chain passes to the side of the track and over a pulley. A weight is attached to the end of this cable, which holds the block off the top of the rail and parallel with it. From the other arm of the bell crank a cable passes to the other side of the track over a pulley and up to the top of the landing or parting. The cable crosses the track under the rails.



AUXILIARY STOP-BLOCK PLACED ABOVE KNUCKLE

At the upper end of the parting the cable is fastened to a lever. When it is desired to pull the stop-block across the rail, the lever is pulled and made fast by a pin or catch. The weight on the end of the cable pulls the stop-block off the rail as soon as the lever is released.

The cars are lowered out of the mine to the top of the incline landing on a single track by an engine placed at the mouth of the mine. At the end of this single track, where it connects with the top of the incline landing, a derail switch is kept open to handle runaways.

Bell cranks and iron rods lead to a lever placed beside the engineer in the engine room and give a positive motion to the switch, which he closes when a trip is hauled over it. The company has but few runaways, and all that occur are caught by means of these safeguards before they do any damage.

Lower End of Turnout Has a Self-Acting Switch

The upper half of the incline above the turnout where the two trips pass is a three-rail double track. The upper end of the turnout needs no switch. The two outside rails are spread the necessary distance apart, and the center rail branches Y-shaped into two rails, which are laid far enough apart to give the necessary clearance for the passing trips of cars, making a double track of four rails. From the lower end of the turnout to the tipple only a single track is laid. A switch is therefore necessary at the lower end of the turnout.

This switch is self-acting. The bridle of the latches is connected to an upright lever placed in a switch stand beside the track. Weights are placed on the top end of this lever, which moves from side to side as the latches are moved from one side to the other by the descending trips. The weight holds the lever down and the latches in place on the one side until the trip goes up. The next trip descends on the other track and throws the latches over, pulling the lever with its weight over also. The weighted lever again holds the latches in place for this track and for the next ascending trip.

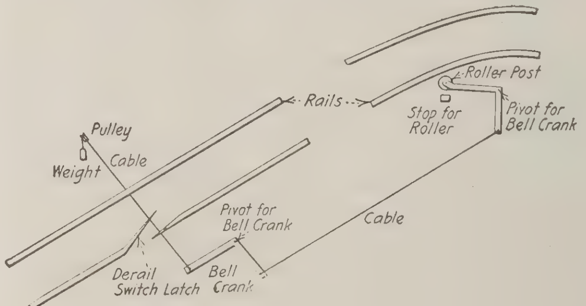
The single track has an automatic derail switch at its lower end near the tipple. At a distance equal to about two trip lengths above the derail switch the track makes a slight curve, which necessitates a roller post to keep the cable from swinging off the incline.

This guide roller is about 18 in. long and is set vertically and mounted on the end of the arm, about 6 ft. long, of a bell crank. The roller is placed on the lower end of the arm, and the upper end is pivoted to a tie or some other suitable support.

The other bell-crank arm extends out at right angles to the track. A small cable or wire is fastened to the end of this arm and extends down the incline to the derail switch, where it is made fast to the arm of another bell crank extending at right angles to the track. This crank is also pivoted to a long tie or suitable support. The other arm of this bell crank, extending down the incline, is connected by a short cable to the derail switch. The cable is continued across the track to the opposite side, where it passes over a pulley, a weight being attached to pull the switch open.

When the trip is below the roller post, carried on the bell crank at the curve, the hoisting rope presses against the roller, which being free to move, operates the bell cranks and cable, thus holding the derail switch firmly closed as long as the trip is below the roller post and the rope is in tension.

In order that the sidewise motion of the roller will not be more than is necessary to operate the switch, a stop or seat is placed back of it to prevent it from going too far. Where a roadbed is on a level with the ground, in order to hang the weights on the ends of the cable wells may be dug a few feet deep and about a foot square and curbed up with planks or the cable may be carried under a pulley at the side of the road and up several feet over another pulley fastened between two uprights, the weights being attached to the end of this cable.



DERAIL SWITCH NEAR TIPPLE

⁂

That the Demand for Cheap Coal by manufacturers and the public generally can be carried too far has been often demonstrated. The sacrifice of life and limb in the colliery districts makes this abundantly clear. No one denies that competition can become so keen as to lead to the occurrence of accidents, for what applies at works on the surface must hold good, to even a greater degree, down the mine in the bowels of the earth. If only the miner could attend more leisurely to his task of getting the coal it is possible there would not be so many accidents, but the modern conditions are against him in this respect. As things are, it often happens that one miner is anxious to get more coal than his neighbor, and in course of time he may pay the penalty of haste.

Meeting of the Alabama Coal Operators' Association

The sixth annual meeting of Alabama coal-mine officials was held under the auspices of the Alabama Coal Operators' Association at the Edgewater mines of the Tennessee Coal, Iron & R.R. Co. on Saturday, July 10, 1915.

The program as given out—which was published in *Coal Age* of July 3—was carried out to the letter, except that two extra features were added. First, Dr. Lloyd Nolan, superintendent of the Department of Health of the Tennessee Coal, Iron & R.R. Co., gave an impromptu talk following the motion pictures illustrating "The Fly Pest" and "War on the Mosquito." Second, demonstrations were given in an explosion gallery to show the comparative action of safety explosives and black powder when fired in the presence of dust.

TAKING A PHOTOGRAPH OF THE MEMBERS WITH A REVOLVING CAMERA

The prepared papers will be published in full or in part in future issues of *Coal Age,* so no comments on them are necessary; but the remarks of Dr. Nolan, being impromptu, call for discussion.

To begin with, Dr. Nolan did important work in sanitation at Panama, so he speaks with authority. In addition to that he has already accomplished much by his work in Alabama. He has the gift of being able to cover his subject fully and in a convincing manner by simply making a few startling statements. Here are a few of them, quoted from memory:

"Ninety-five per cent. of all flies are bred in stables. If all stables were cleaned out daily, the wet manure being either spread out on the ground to dry or treated with borax or sulphate of iron, flies would become curiosities. Even if all manure were hauled out weekly and burned, the same statement would be true."

A manager sitting next to the writer remarked that henceforth his stableman would have little idle time on his hands. He probably expressed in words what most of the managers present were silently thinking.

Then for fear that some of his audience might think he was indulging in figures of speech, Dr. Nolan added that the records at Panama bore out his statement.

Since all flies are not liable to be exterminated in the near future, the next statement had to do with the possibility of rendering flies harmless.

"Make all water-closets flyproof if you want to render most flies harmless," was the way the Doctor expressed it. Just to show that such a water-closet can be built,

LUNCHEON AT BAYVIEW BEFORE RETURNING TO EDGEWATER there was one on exhibition just outside of the hall, and during the interim between the morning and the afternoon sessions most everyone present inspected it.

Dr. Nolan closed his case against the fly by stating that in his opinion typhoid fever would almost disappear from the health statistics of Birmingham if all of the 20,000 open closets could be done away with, and he based his conclusion on the fact that both the water supply and the milk supply in the city are far above the average.

His treatment of the mosquito was quite as impressive. He stated that there are two kinds of mosquito in Alabama—the Anopheles, which is the dangerous one, and the Culex or house mosquito, which is harmless. The Anopheles is the villian that is responsible for most of the malaria in Alabama. The Tennessee Coal, Iron & R.R. Co., acting under Dr. Nolan's directions, has proved the truth of that statement by reducing the number of Anopheles, and likewise reducing the number of cases of malaria. Getting rid of mosquitoes is the simplest thing in the world. Get rid of all stagnant water, and if you can't get rid of it, cover the surface with oil. Everyone knows that; but most people have lakes in mind, when as a matter of fact rain barrels and empty tin cans cause a good deal of the trouble.

A LINEUP OF THE ALABAMA COAL OPERATORS' ASSOCIATION IN FRONT OF THE EDGEWATER TOWN HALL

Dr. Nolan's talk carried conviction. It now remains to be seen whether it will inspire action.

Taken all in all, the meeting was one of the most instructive that the association has ever held, and it was also very satisfactory from the standpoint of attendance. Priestley Toulmin, president of the Lehigh Coal Co., presided over the meeting, and Frank Crockard, vice-president of the Tennessee, Coal Iron & R.R. Co., assumed the rôle of "spieler" when the guests started out to inspect the mining equipment at Edgewater.

Chicago Convention of the Ko Koal

The national coal convention and tenth anniversary of the Order Ko Koal opened at the Auditorium Hotel, Chicago, on Monday afternoon, July 12. The meeting was one of the most important in the history of the order. Out of it there will probably grow a national organization to promote business and social relations in the coal trade of the country and to disseminate to the public and other business organizations facts and figures acquainting them with the actual situation of the fuel industry.

In his address of welcome President Charles L. Dering, of the Chicago Association of Commerce, and well known in the anthracite coal trade as the manager of the D., L. & W. interests in the West, urged the organization of a national coal association. He pointed to the need of such an organization, and declared that business men are regarded in a new light today. There was a time not long ago when business was represented in legislative halls only by seekers of special privilege; but a radical change has taken place in public sentiment and business now deals openly and squarely, and pleads its case on the merits of its cause.

Mr. Dering pleaded for a cessation of the bickerings and jealousies in the coal trade and advocated the formation of a national organization of dealers so that the trade may better work out its salvation through special committees. He strongly urged that the body form an organization which would stand for something and not for horseplay and unnecessary frivolity. In this connection he said: "The present is a time of changed ideas. Business today views without alarm so momentous an innovation as the establishment of the Federal trade commission. A few years ago such a departure in national affairs could only have been regarded as a menace—a blow to the inalienable rights of business to work out its own salvation."

Resolutions Adopted

A resolution was adopted, reading in part as follows:

That the Order of Ko Koal be continued in fact, and that all horseplay be eliminated and absolutely prohibited from all of its initiatory ceremonies.

That in every program given under its auspices educational features must predominate.

That a bureau be established to collect, prepare and disseminate facts and figures covering cost of production, distributing and retailing of the various grades of coal from the mines to the consumer, in order to show the less-informed members of the trades as well as the consumer what constitutes a reasonable price for coal in different sections of the country.

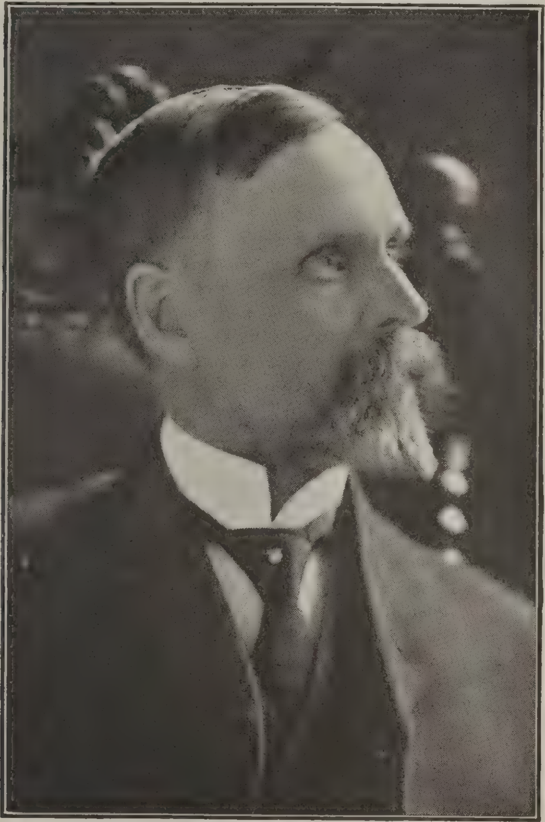
That plans be formed to present this information to local chambers of commerce, business-men's associations and in other ways to promote the best interests of all branches of the coal industry.

At the banquet, which was held at 6:30 in the evening at the Auditorium Hotel, the suggestion of Mr. Dering that the body form a national organization was enthusiastically adopted. F. S. Peabody presided, and among the speakers were Homer D. Jones, of Chicago, Charles F. Kerchner, of Baltimore, and H. C. McKinney, of Kansas City. President C. M. Moderwell of the Illinois Coal

Operators' Association delivered a very interesting address, his subject being "The Advantage of a Definite Aim." Walter S. Bogle, dean of Chicago coal men, in dwelling on his subject, "How Selling Prices Kept Up with Rising Costs," stated that the public has no idea of the number of coal companies now in bankruptcy, and that the profits of coal operators are decreasing each year owing to increased cost of labor, liability insurance and other factors little known by the public, which has increased the cost of operations.

Death of Charles C. Rose

The coal-mining industry has lost one of its oldest and most widely known colliery officials in the death of Charles C. Rose, general superintendent of the Delaware & Hudson Co., on Saturday, July 17. Mr. Rose would have celebrated his 78th birthday on Sunday last, and although recently he did not enjoy robust health, his illness was not considered serious until about eight weeks ago.



CHARLES C. ROSE

He was born at Rose Points, near Port Jervis, N. Y., of old New England stock, his ancestors being among the first Puritans who settled in this country. When 14 years of age Mr. Rose accepted a position with his father's firm, leaving it a short time later to enter the employment of the Erie R.R. While holding the latter position he took up the study of engineering, and through this preparatory work secured a position as civil engineer with the New Jersey Midland R.R. Co. His next connection was with the Delaware & Hudson Co. on operations in the vicinity of Lake Champlain.

In 1882, after having completed work for the Delaware, Lackawanna & Western Co. in the construction of a new railroad line west of Binghamton, N. Y., Mr. Rose moved to Scranton and became assistant chief engineer for the D., L. & W. Co. He continued in the employ of this company until 1896, when he was offered a position as assistant superintendent of the Delaware & Hudson Co.'s coal mines. One year later he was advanced to the important post of general superintendent of all the coal-mining operations of the D. & H. Co., and continued to serve in that capacity until the time of his death.

Mr. Rose was married twice. He had one son by his first wife and one by his second wife. Both sons and his wife, Emma B. Rose, survive him.

Mr. Rose was a quiet, unassuming man who avoided publicity at all times. He succeeded in advancing himself to a place of eminence in the anthracite industry. As a mark of unusual respect for the man who rendered so many years of faithful service all the Delaware & Hudson collieries were closed at noon on Monday of this week. A host of friends, most of them old employees, attended the funeral.

American Coal Sold in Sweden

Through the efforts of the consulate-general the Swedish state railways have purchased 100,000 tons of West Virginia coal, says Consul-General Ernest L. Harris, of Stockholm, Sweden, in *Commerce Reports.* Including the purchases in February, the total amount of American coal recently sold to the Swedish state railways is 120,000 tons. Private industrial enterprises in Sweden also use large quantities of coal. Sweden consumes over 4,000,000 tons of coal annually, chiefly coming from England, which has put an embargo on coal.

Recent Legal Decisions

Duty to Safeguard Setscrew on Shaft—In a suit for injury to a 19-year-old boy whose arm was caught by a setscrew on a revolving shaft while he was attempting to tighten a takeup on a jig shaft at a colliery, it was a question for the jury to determine whether defendant coal company was negligent in failing to box or guard the shaft. (Pennsylvania Court of Common Pleas, DeCrisse vs. Lehigh Valley Coal Co., 43 Pennsylvania County Court Reports 126.)

Enforcement of Mining Contracts—If a contract for removal of coal from a mine gives the owner of the mine the right to indefinitely postpone operations, there is such want of mutuality of obligation that the agreement can be terminated at the will of either party. If the contract is silent as to the time for its performance, the law presumes that the parties intended that it will be performed within a reasonable time, considering all the attending circumstances. The terms of a written contract cannot be contradicted by showing a trade custom at variance with such terms. (Alabama Supreme Court, Pratt Consolidated Coal Co., 68 Southern Reporter, 63.)

Assumption of Risk by Miner—If a dangerous condition in a mine resulting from props being placed too close to a track was obvious, a miner assumed the risk of being injured in consequence of that condition. (Kentucky Court of Appeals, Walker's Administrator vs. Bon Jellico Coal Co., 175 Southwestern Reporter 628.) Although an experienced miner was injured through fall of slate in a room neck wherein he was engaged in blasting down and removing coal after the same had been cut under by other employees, he cannot recover damages against his employer if it was his own duty to inspect the roof as the work progressed to ascertain its safety and if he had just blasted down coal under the slate which fell. In such circumstances he had the best opportunity to determine the safety of his working-place. (Same court, Stratton vs. Northeastern Coal Co., 175 Southwestern Reporter 333.)

New York City's New Coal Specifications

SYNOPSIS—An analysis of the new specifications to be adopted shortly. The tonnages purchased under this plan aggregate half a million. The specifications have been evolved from years of experience and careful study. The main changes are in anthracite coal, in which radical readjustments have been made.

New York City coal men will be interested in the new set of specifications under which it is proposed to purchase all coal intended for use in the various city departments of Greater New York, amounting to more than half a million tons. These new specifications have been prepared after three months' careful thought and work by a special committee of representatives of the largest coal-using departments, who have collaborated with the Bureau of Standards of the Board of Estimate and Apportionment.

A RADICAL CHANGE IN THE BUCKWHEATS

The most important change in the specifications has been made in the table of analysis. Of these changes the ash per cent. allowed for No. 3 buckwheat stands out most prominently, this having been reduced from 19 to 16 per cent. In view of this and other changes, the Bureau of Standards has seen fit to reverse the order of these sizes, placing No. 3 first on the list of buckwheat coals and Nos. 2 and 1 following in the order named. In changing the ash percentages for the buckwheat coals the committee sent out special investigators and learned that large individual users of these coals, especially No. 3, were able to obtain coals giving a 14 per cent. ash with from 13,900 to 14,000 B.t.u., while the city was being supplied with coals giving from 18 to 23 per cent. ash and running from 11,500 to 11,900 B.t.u.

In view of the fact that the various city departments in 1914 used 124,000 tons of No. 1 buckwheat, 20,499 tons of No. 2 and 62,517 tons of No. 3, the committee determined to devise a method for getting a better quality of this grade and therefore raised the standards. It was also learned, according to the committee, that the city was paying from 15c. to 25c. more per ton for its No. 3 buckwheat coal than certain individuals were paying, although the latter, it is claimed, were getting a better quality of fuel.

It has been decided that if a sufficient supply of these smaller coals can be obtained, wherever possible they shall be substituted for the larger and more expensive grades.

NEW ANALYSIS AND BONUSES

The table of analysis in the new specifications is as follows:

Sizes	Moisture*	Ash†	Volatile†	Sulphur†	B.t.u.†
Broken	4	9	9	1.5	13,500
Egg	4	11	9	1.5	13,200
Stove	4	12	9	1.5	13,000
Chestnut	4	12	9	1.5	13,000
Pea	5	16	9	1.5	12,400
Buckwheat No. 3....	6	16	9	1.5	12,400
Buckwheat No. 2....	6	18	9	1.5	12,200
Buckwheat No. 1....	6	18	9	1.5	12,200

*As delivered. †Dry coal.

The table of analysis in the former specifications, which have been in force for more than four years, is as follows:

Sizes	Moisture*	Ash†	Volatile†	Sulphur†	B.t.u.†
Broken	4	11	8	1.5	13,200
Egg	4	11	8	1.5	13,200
Stove	4	12	8	1.5	13,000
Nut	4	12	8	1.5	13,000
Pea	4	12	8	1.5	13,000
Buckwheat No. 1....	6	18	8	1.5	12,200
Buckwheat No. 2....	6	19	8	1.5	12,100
Buckwheat No. 3....	6	19	8	1.5	12,000

*As delivered. †Dry coal.

In providing for the "Correction of Ash" the specifications say:

For each 1 per cent. of ash in the broken size in excess of the standard of 9 per cent. and up to and including 11 per cent., the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 1 per cent. of ash in excess of 11 per cent. the gross weight of coal shall be reduced at the rate of 2 per cent.

For each 1 per cent. of ash in the egg size in excess of the standard of 11 per cent. and up to and including 13 per cent. the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 1 per cent. of ash in excess of 13 per cent. the gross weight of coal shall be reduced at the rate of 2 per cent.

For each 1 per cent. of ash in stove and chestnut sizes in excess of the standard of 12 per cent. and up to and including 14 per cent. the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 1 per cent. of ash in excess of 14 per cent. the gross weight of coal shall be reduced at the rate of 2 per cent.

For each 1 per cent. of ash in the pea and buckwheat No. 3 sizes in excess of the standard of 16 per cent. and up to and including 18 per cent. the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 1 per cent. of ash in excess of 18 per cent. the gross weight of coal shall be at the rate of 2 per cent.

For each 1 per cent. of ash in buckwheat No. 1 and buckwheat No. 2 sizes in excess of the standard of 18 per cent. and up to and including 20 per cent. the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 1 per cent. of ash in excess of 20 per cent. the gross weight of coal shall be at the rate of 2 per cent.

Reductions in the gross weight of coal for excess ash above the standard of 9 per cent. for broken sizes, up to and including 11 per cent. in excess of the standard of 11 per cent. for egg size, up to and including 13 per cent. in excess of the standard of 12 per cent. for stove and chestnut sizes, up to and including 14 per cent. in excess of the standard of 16 per cent. for pea and buckwheat No. 3 sizes, up to and including 18 per cent. and in excess of the standard of 18 per cent. for buckwheat No. 1 and buckwheat No. 2 sizes, up to and including 20 per cent. in deliveries, shall be offset by remitting such reductions made on the 1 per cent. basis at the rate of 1 per cent. for each 1 per cent. on the amount of coal in other deliveries under the same contract at the same unit price which contains ash below the standards of 9 per cent. for broken size, 11 per cent. for egg size, 12 per cent. for stove and chestnut sizes, 16 per cent. for pea and buckwheat No. 3 sizes and 18 per cent. for buckwheat No. 1 and buckwheat No. 2 sizes. No deductions made on the 2 per cent. basis shall be remitted. The percentages of ash shall be computed to the nearest tenth of a per cent. All such remissions of reductions in the gross weight of coal shall be made upon the final payments under contracts for coal delivered.

THE CORRECTION FOR THE B.T.U. VALUE

In the specifications which will be superseded it is provided that "the gross weight of coal after correction for excess of moisture shall be reduced at the rate of 1 per cent. for each per cent. of ash in excess of the standard analysis specified for the particular kind and size of coal delivered."

In the correction for deficiency in B.t.u.'s the specifications provide as follows:

For each 100 B.t.u. in broken size below the standard of 13,500 B.t.u. per lb. of dry coal and down to and including

13,200 the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 100 B.t.u. below 13,200 the gross weight of coal shall be reduced at the rate of 2 per cent.

For each 100 B.t.u. in egg size below the standard of 13,200 and down to and including 12,900 the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 100 B.t.u. below 12,900 the gross weight of coal shall be reduced at the rate of 2 per cent.

For each 100 B.t.u. in stove and chestnut sizes below the standard of 13,000 and down to and including 12,700 the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 100 B.t.u. below 12,700 the gross weight of coal shall be reduced at the rate of 2 per cent.

For each 100 B.t.u. in pea and buckwheat No. 3 sizes below the standard of 12,400 and down to and including 12,100 the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 100 B.t.u. below 12,100 the gross weight of coal shall be reduced at the rate of 2 per cent.

For each 100 B.t.u. in buckwheat No. 1 and buckwheat No. 2 sizes below the standard of 12,200 and down to and including 11,900 the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 100 B.t.u. below 11,900 the gross weight of coal shall be reduced at the rate of 2 per cent.

In order that the successful bidder shall be reimbursed should some of his deliveries exceed the quality called for by the contract, the specifications say that reductions in the gross weight of coal for deficiencies in B.t.u. below the standards specified in the paragraphs relating to correction for deficiency shall be offset by remitting such reductions made on the 1-per cent. basis at the rate of 1 per cent. for each 100 B.t.u. that coal in other deliveries under the same contract at the same unit price contains B.t.u. in excess of the standards set forth in the table of analysis. No deductions made on the 2-per cent. basis shall be remitted. The deductions in B.t.u.'s shall in every case be computed to the nearest 50 units.

Corrections for Gross Weight

The former specifications simply provided that the gross weight of coal, after correction for excess moisture, should be reduced at the rate of 1 per cent. for each 100 B.t.u.'s below the standard heating value specified in the analysis for the particular kind and size of coal delivered.

In providing for the aggregate reductions in gross weight the specifications read as follows:

After the correction for excess moisture shall have been made as herein specified, all percentage in reductions as herein described to be made on account of a deficient number of B.t.u. per pound, and all percentage in excesses of ash, volatile combustible matter and volatile sulphur shall be aggregated and totalized, and shall be deducted as a whole, and each payment shall be made only for the balance of the gross weight of coal delivered at the price bid per unit, except that, before the final payment is made under a contract, deductions in the gross weight of deliveries of 1 per cent. made for deficiencies in B.t.u. as herein described shall be offset by remitting such deductions at the rate of 1 per cent. for each 100 B.t.u. that coal in other deliveries under the same contract at the same unit price exceeds the standard given herein, and that deductions in the gross weight of deliveries of 1 per cent. for excess of ash as herein described shall be offset by remitting such deductions at the rate of 1 per cent. for each 1 per cent. that the amount of coal in other deliveries under the same contract at the same unit price contains ash below the standard given here. The total offsetting tonnage shall never exceed the tonnage deductions on the 1 per cent. basis for ash and B.t.u., nor shall offsetting tonnage on coal at one unit price be remitted from reductions on coal at a different unit price. Deductions made for excess moisture, volatile combustible matter and volatile sulphur shall not be remitted.

Changes in Semi-Bituminous

The changes provided for the purchase of semi-bituminous coal are not so pronounced, as can be seen by a comparison of the tables of analysis in the new specifications and in the old, as shown in the following tables:

NEW

Sizes	Moisture*	Ash†	Volatile†	Sulphur†	B.t.u.†
Run-of-mine	3	9	25	2	14,000
Lump	3	9	25	2	14,000
Chestnut	3	9	25	2	14,000
Slack	3	11	25	2	13,600

OLD

Sizes	Moisture*	Ash†	Volatile†	Sulphur†	B.t.u.†
Run-of-mine	3	10	25	1.75	13,800
Lump	2.5	9	25	1.5	14,000
Chestnut	2.5	9	25	1.5	14.000
Slack	3	11	25	1.75	13,600

*As delivered. †Dry coal.

CORRECTION FOR ASH

The gross weight of coal, after the correction for excess moisture, shall be reduced as follows:

For each 1 per cent. of ash in run-of-mine, lump and chestnut sizes in excess of the standard of 9 per cent. and up to and including 12 per cent. the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 1 per cent. of ash in excess of 12 per cent. the gross weight of coal shall be reduced at the rate of 2 per cent. For each 1 per cent. of ash in slack size in excess of the standard of 11 per cent., and up to and including 13 per cent., the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 1 per cent. of ash in excess of 13 per cent. the gross weight of coal shall be reduced at the rate of 2 per cent.

Reductions in the gross weight of coal for excess ash above the standard of 9 per cent. for run-of-mine, lump and chestnut sizes up to and including 12 per cent. and in excess of the standard of 11 per cent. for slack size up to and including 13 per cent. in deliveries shall be offset by remitting such reductions made on the 1 per cent. basis at the rate of 1 per cent. for each 1 per cent. on the amount of coal in other deliveries under the same contract at the same unit price which contains ash below the standard of 9 per cent. for run-of-mine, lump and chestnut sizes and below 11 per cent. for slack size. No deductions made on the 2 per cent. basis shall be remitted. The percentages of ash shall be computed to the nearest tenth of a per cent. All such remissions of reductions in the gross weight of coal shall be made upon the final payments under contracts for coal delivered.

Method of Weighing Bituminous

The old specifications simply provided that the gross weight of coal, after the correction for excess of moisture, should be reduced 1 per cent. for each per cent. of ash in excess of the amount allowed in the standard analysis specified for the particular kind and size of coal delivered and that the percentage of ash should be computed to the nearest tenth of a per cent.

To establish the gross weight after correction for excess moisture the specifications provide that:

For each 100 B.t.u. in run-of-mine, lump and chestnut sizes below the standard of 14,000 B.t.u. per lb. of dry coal, and down to and including 13,500, the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 100 B.t.u. below 13,500 the gross weight of coal shall be reduced at the rate of 2 per cent. For each 100 B.t.u. in slack size below the standard of 13,600 and down to and including 13,300 the gross weight of coal shall be reduced at the rate of 1 per cent., and for each 100 B.t.u. below 13,300 the gross weight of coal shall be reduced at the rate of 2 per cent.

Reductions in the gross weight of coal for deficiency in B.t.u. below the standard of 14,000 for run-of-mine, lump and chestnut sizes down to and including 13,500, and below the standard of 13,600 for slack size down to and including 13,300 in deliveries, shall be offset by remitting such reductions made on the 1 per cent. basis at the rate of 1 per cent. for each 100 B.t.u. that coal in other deliveries under the same contract at the same unit price contains B.t.u. in excess of the standard of 14,000 for run-of-mine, lump and chestnut sizes and in excess of the standard of 13,600 for slack size. No deductions made on the 2 per cent. basis shall be remitted. The deductions for deficiencies in B.t.u. shall be computed to the nearest 50 units. All such remissions of reductions in the gross weight of coal shall be made upon the final payments under contracts for coal delivered.

How premiums may be secured by the delivery of coal in excess of the requirements of the contract is provided for as in the specifications relating to anthracite coal.

The Labor Situation

SYNOPSIS—Much interest centers around the meeting of District No. 1 at Scranton, Penn. The radicals there, as in West Virginia and Illinois, are disposed to break up the union. The South Wales strike appears to be settled, the men receiving a further increase in wage. The Munitions Act was powerless to restrain the strikers.

The miners in District No. 1 of the United Mine Workers of America who assembled on July 19 at Scranton, Penn., were jubilant over the condition of the union. There are 43,000 members in that district, with a cash balance in the treasury of $81,000, which is only about $1.89 for each member, and even less for each mineworker in the district. The union lists show an increase of 8000 since 1913.

There are members and enthusiasm, but there is little money; and it is a safe guess to state that the miners will get little more than the operators are prepared to concede them, for the miners elsewhere will hardly be able to contribute much owing to the slack work in the past.

However, there is no reason why concessions should not be received in the direction of the 8-hour day and perhaps recognition of the union—for the first has popular approval and the second, as far as the anthracite region is concerned, would probably be a guarantee of greater industrial peace, and therefore acceptable to the operators. The abolition of the conciliation board will not meet with public approval, though the fight is largely about names. Any other board would be but little different from that now sitting.

Method of Measurement Is a Cause of Discontent

The miners object to the arrangement which the Pennsylvania Coal Co., the Hillside Coal & Coke Co., and the Delaware & Hudson Co. have with their men, whereby a ton is rated at 2700 lb., that being supposed to net 2240 lb. after cleaning. There is a rebate if the coal gives a better result, and that rebate is usually received. The miners object to payment by the car where that is the system, and a change is likely to be urged by the union.

The miners have not by any means the unanimity which might be expected. A disruption is feared by the leaders, and the need for solidarity will be urged on the delegates. There is a radical element which is content with nothing. This element prefers the methods of the Industrial Workers of the World to the orderly methods of the union.

An Increase in Wage Demanded at a Pennsylvania Mine

The coal miners of the Shenango Furnace Co., at Wilpen, in Westmoreland County, Penn., went on strike on July 12 for an increase in wages of 10c. per ton. The company complained that the miners did not load their cars as high above the sides as they should, and the miners countered with the demand for higher wages. About 100 men walked out when the claim was not met. The company stated that it had a contract for a year calling for 950 tons per day and that it could only be filled at the present scale of wages. The records show that in 1913 this mine had 250 employees and the production was about 1000 tons per day.

Strikes for Run-of-Mine Weighing in Eastern Ohio

In Ohio the miners are discontent at the slowness with which mine-run weigh scales are being installed. The employees claim that the operators prefer to continue the temporary arrangements by which the slack produced is estimated and added to the weighings of the lump coal. About 2000 miners in Belmont County, Ohio, have gone on strike. It is not likely that the trouble will continue, as the operators are installing scales which will enable them to weigh the coal as it comes from the mines.

At Nelsonville, Ohio, the Manhattan Coal Co. has closed down two of its mines because some of its employees refused to accept a reduction in wages. About 500 men are idle. In 1913 the Manhattan Coal Co. had 825 employees. Its mines are in the Hocking Valley district, where the Sunday Creek Co. has recently closed all its mines.

In the eastern Ohio district conditions are better. Since the strike about 30 mines have gone to work and others are preparing to resume. The Maher mine of the Purseglove-Maher Coal Co. at Glencoe, which employs about 200 men, and the Johnson Coal Co. mine at Pipe Creek (Dilles Bottom P. O.), employing about as many, resumed work on July 15.

Dissension in Cabin Creek Labor Unions

Dissension has arisen in the unions in West Virginia and Illinois. On the failure of the district convention in Charleston, to sustain by its vote the charges of fraud in union elections, brought against certain officials of the union by Cabin Creek miners, a number of delegates from that district bolted the convention, declaring their intention of forming an independent union. It is reported that only 40 of the 63 delegates who advocated sustaining the charges left the meeting, and that they represent only a small number of the Paint and Cabin Creek miners; but the independents have called for a general convention to be held at Montgomery on Aug. 2, at which time a show of strength will be possible. Sweeping charges of questionable methods and machine politics on the part of present union officials are made by the independents.

Some further details of this dispute can be found in "Coal Age" of July 3. It is there stated that Thomas Haggerty was accused of using the funds of the union to secure the election of L. C. Rogers and his associates, but was exonerated by the International Executive Board.

A New Local Union of Moderates at O'Fallon, Ill.

A new local miners' union was organized on Friday, June 24, at O'Fallon, Ill., composed of dissatisfied members of the local United Mine Workers Union. The president of the local thus suffering from dissension is David Wilson. He is known as "King David." It is alleged that the socialists in the union, who compose 60 per cent. of the membership, have caused discrimination to be shown to their followers in apportioning work. The nonsocialists claim that there has been so much unrest and dissatisfaction among the miners that the companies could not operate to advantage and so have been running irregularly. They want to get back to work and have elected George Goodall president, Martin Gurney vice-president and several other officials to plan for peace and progress.

Violence Attempted at Fairmont, W. Va.

Three men were arrested at Fairmont, W. Va., on July 17 charged with plotting to dynamite the residence of former United States Senator Clarence Watson and three of his relatives, who are heads of the Consolidation Coal Co. The plot is generally thought to be due, not to labor troubles, for there are none, but to the fact that the company has been shipping coal to Great Britain and her allies. The men were arrested on the testimony of Roy Dunn, a 16-year-old boy, who while concealed heard the men discussing the plot. He was discovered by the plotters, who bound him and threw him into the Monongahela River, from which he barely escaped with his life. A suitcase full of dynamite was later found by officers near where the men had held their conference.

A Miner and Labor Leader in a King's Cabinet

It is interesting to note that William Brace, who began his career as a pit-boy in a Welsh coal mine at the age of 12 and worked as a miner for 12 years, has entered the new coalition cabinet in Great Britain as Under-Secretary of Home Affairs. Of course promotion even higher for representatives of labor is even commoner in Great Britain than it is here. Brace was a talented organizer, and it was largely owing to his efforts that the South Wales Miners' Federation was formed, of which he ultimately became president.

He did much to ally this body with the Miners' Federation of Great Britain. He entered Parliament in 1906 as a member of the Labor party. He is 50 years of age. He often preaches in the Baptist church. He looks more like a successful businessman than a miner, but he has not lost his democratic instincts or his sense of comradeship with those who have helped him to his present position.

South Wales Strike Is a Protest Against Munitions Act

The difficulty in South Wales, which appears at present writing, July 21, to be settled, is a political issue rather than a contest between capital and labor. The miners are striking at the Munitions of War Act, which compels them to accept arbitration and forbids them to strike under a penalty of a fine of about $25 per day for each day of idleness. Their leaders, who have a broader knowledge of the situation than the miners, and who can stand off and view the war conditions comprehensively, have for the most part been trying to get the men back to work. So has the Federation of Miners of the United Kingdom. The labor leaders, at the recommendation of Lloyd George, Minister of Munitions, have agreed to settle the strike if granted a further increase of 10 per cent. in wages and other important concessions.

New Apparatus and Equipment

Safety Check Hook and Lock

At practically all coal mines of any size in the United States the check system has been adopted as a means of identifying the coal produced by the different miners. Each coal digger or loader is given a certain number of brass checks bearing his work number. He attaches one of these to each car that he loads out. When the car is dumped the check is removed and the coal which the car contained is credited to the man whose check it bore.

Much trouble has resulted from "stealing of cars"—that is, the removal of the rightful check and the substitution of another. By this means an unscrupulous miner may often get credit and receive payment for many cars of coal that he did not dig. It has been estimated that, taking the country as a whole, each miner will average the loss of one car each month through this form of petty thievery. Furthermore, not infrequently a check becomes detached from its proper hook or nail and is lost; in which case of course the car of coal cannot be credited to the proper person.

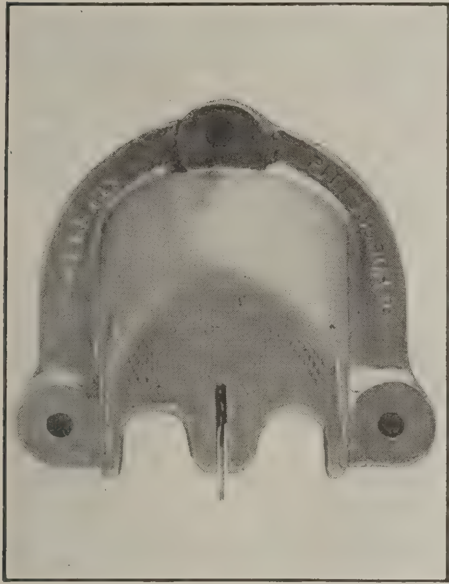


FIG. 1. FRONT VIEW

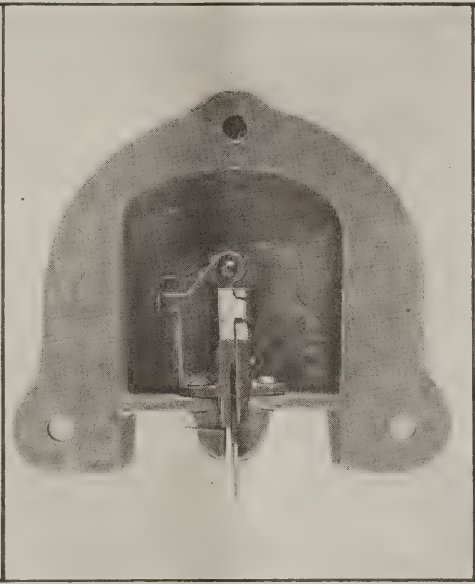

FIG. 2. REAR VIEW

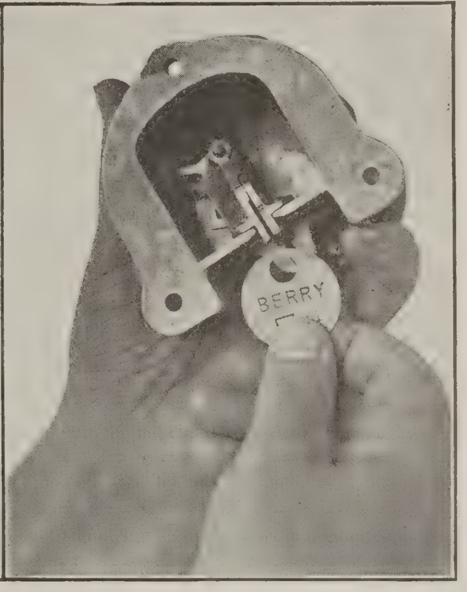

FIG. 3. CHECK REMOVED

To obviate these difficulties, the S. C. Webb Co., of Pittsburgh, Penn., has brought out the "check hook" shown in the accompanying illustrations. This "hook" consists of a gravity-operated padlock inclosed in a suitable cast-iron shield which is bolted or riveted to the left-hand side of the car. A check may be inserted in the slot provided for that purpose and locked securely in position. When the car arrives at the dump and is tilted 25 deg. or more, a slight upward pressure on the check, followed by a downward pull, quickly and easily removes it.

When the car has been returned to the mine and is level, or nearly so, another check may readily be inserted. A check cannot be inserted and locked in place unless the car is level or nearly so, nor can one be removed except when the car is tilted 25 deg. or more as in discharging.

The illustration shows three views of this nonpickable safety check hook and lock. Figs. 1 and 2 are a front and a rear view of the apparatus, with a check locked in place. Fig. 3 shows the lock tilted sufficiently to allow the check to be removed.

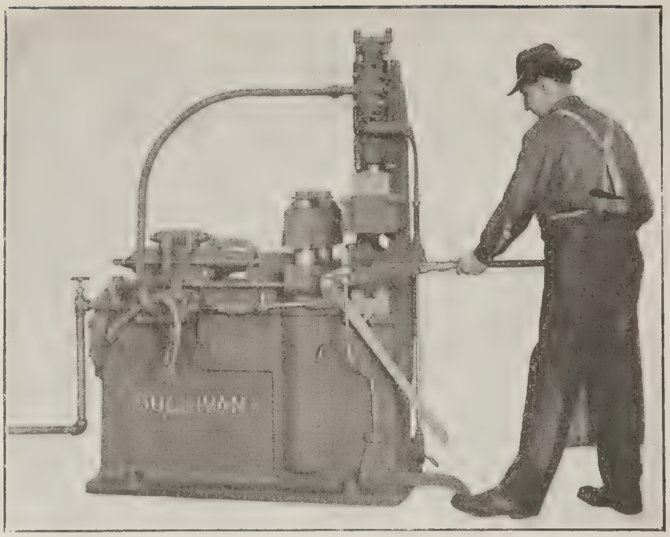
This check lock renders it extremely inconvenient for the would-be "car thief" to substitute his check for that of the rightful "owner." Since it is possible to remove a check only when the car is tilted, as in the dumping position, a loaded car would have to be jacked or pried up to such a position before the removal of a check could be accomplished. This would require too much work and take too long a time to be successfully accomplished. The new hook therefore protects the miner from loss. It also removes a prolific cause for suspicion and unrest among the miners.

⁂

A New Drill Sharpener

A new machine for making and sharpening rock drills, as well as making chain machine bits and other blacksmith work around the mine, has been developed by the Sullivan Machinery Co., of Chicago, Ill. This machine in general follows the lines of the Imperial sharpener built for many years by T. H. Proske, of Denver, but is considerably larger and more heavily built, as well as being more powerful than its prototype.

This sharpener consists of two members, one being horizontal while the other is vertical. Each member is equipped with a Sullivan rock-drill cylinder provided with differential air-thrown valve motion. The horizontal hammer upsets the steel to the general shape of the

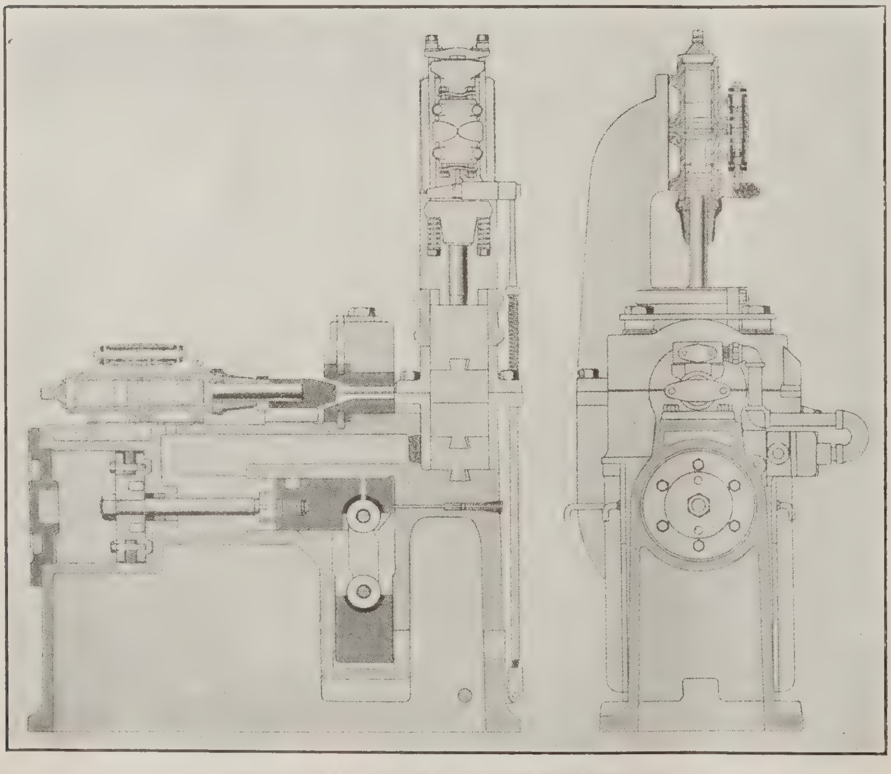


THE DRILL SHARPENER IN USE

bit or shank of the drill, while the vertical member is used for shaping the wings of the bit, etc., and for drawing out and finishing the corners. Steel dies are of course employed, one acting as an anvil and the other as a hammer, the latter being attached to the piston. While the drill steel is being upset it is held in position by a heavy vise operated by air pressure.

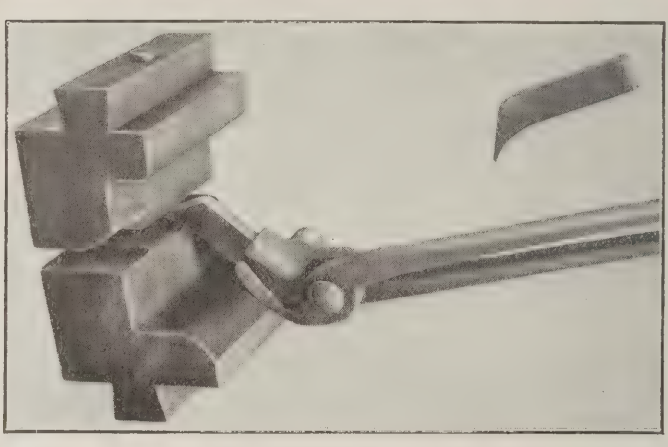
The new sharpener occupies a floor space of 5x2½ ft. and is 6 ft. high, weighing 4000 lb. Provision is made so that the operator cannot start the upsetting hammer until the clamp or vise is in operation. There is also a positive guard against operating the vertical hammer while the horizontal one is being used.

The control levers are so placed that the smith operates the machine with his left hand and left foot, the steel being easily held with the right hand. With a little practice a blacksmith may make a new drill steel in from 50 sec. to 1 min. and machine bits with equal rapidity.



SECTIONAL VIEWS OF THE MACHINE

Bits of any form or size may be made on this machine from steel of any shape, either solid or hollow. It is, however, of course necessary to furnish proper dollies and dies for the different sizes or shapes of bit. Drill steels are now being made on this machine, both cross and six-point rose shaped, for the ordinary hand hammer drills as well as for air-driven stoping drills extensively used in coal mines for light rock excavations, taking down roof, trimming walls or taking up bottoms of gangways or headings where the thickness of the coal measures requires such work. Dollies may also be made for putting the lugs and collars on the shanks of hexagon and round drill steel required by various types of drills used for these purposes.



DIES FOR MAKING CHAIN BITS

In addition to this the Sullivan sharpener will do a variety of special work, such as forging bolt-heads and making coupling pins for mine cars. Furthermore, by the aid of suitable dies and dollies, bits for use in the chain type of electrically driven or air-driven undercutter may be readily forged.

It has long been recognized that so far as the quality of the steel is concerned no improvement can be made upon the method of sharpening drill bits by hand. The constant hammering and working of the steel over the anvil secures a toughness and durability impossible by pressing or forming methods. This is, however, the exact result obtained by the use of this sharpener, since all shaping and forming are done by hammering. In addition to this, uniformity in the gage of the drill bits is secured, while steels may be sharpened or made from new stock at a much more rapid rate than is possible to attain by hand methods.

During the past few years many small portable compressor outfits have been sold for use underground. These drive small hand-held drills which are used during a great percentage of the time on rock removal. By the aid of this new Sullivan sharpener, steel suitable for use in these drills may be manufactured or sharpened with great uniformity and precision, as well as rapid dispatch.

Editorials

Ever a Better Beyond

The trouble with all our agreements in the coal industry is that they are regarded by the miners as only temporary arrangements, as contracts *ad interim*. There is no harm in making them binding for only short periods of time, with the idea that if conditions change there should be a change in scale. So, too, these documents should be recast occasionally to remove unexpected inadequacies or to provide for somewhat general changes in the public attitude to the labor problem.

But the union takes an entirely different view of the matter and has quite another reason for wanting a short-time agreement. It desires to raise the rate of compensation steadily without any regard to the demand for coal, its price or the cost of living. Its purpose is steadily to ask for more. "This," the union says, "is all we demand this time. Next time we will have other demands." This attitude is one which can only be right if the agreements made are always unfair to the miners and promise inadequate compensation for their labor, and if the work of arbitration commissions, if appointed, is always improperly performed.

When the unionized miners want a different contract from that under which they are working they should be able to show a new condition warranting a change in contract. If they cannot show it, their strife should be sternly reprobated by the public. The consumer should exhibit an uncompromising attitude to both operators and miners when they strive without modifying cause to disturb agreements which have been carefully adjudicated and on which a business has been assiduously built.

⁂

Housing Coal Miners

It was with full conviction that *Coal Age* is an open forum that we published the second article entitled "Why Are Strikes at Coal Mines of Such Frequent Occurrence?", for we cannot say it has our indorsement. Our remarks are limited at present, however, to that part of that article that refers to the house problem.

The rent of houses at mining villages was set many years ago, and with the years has not increased. Two decades ago miners and others lived on a lowly scale. The timber was cut from woods within a mile of the village to be built, and the mill which reduced the logs to boards and scantlings was probably even nearer. The houses quite frequently had no cellars and stood on posts. They were not painted and in most cases building paper, in rough red sheets held in place with loose-headed nails, lined the interior.

These houses, which sheltered now lumberjacks, now miners, were regarded as satisfactory dwellings in that primitive time. For no one came into that "neck of woods" unless he had the soul of a pioneer. He rather gloried in inconveniences, as people are wont to do who go hunting and build an insanitary hut and call it a bungalow or a shooting lodge.

All this rustic simplicity was comforting to the lumberman and mine owner. He made 30 to 50 per cent. per annum on the kind of house he furnished, as the lumber could be put down at the site for little over $8 per thousand, perhaps a third what it is now; and there was little loss when the time came to move the town, for there was no masonry or plastering to be spoiled in demolishing the house, and the roof might even be clapboarded, and so redeemable in large part.

In those days there was indeed a large profit in houses. It was a "graft" only inferior to the company store and the railroad rebate. And it would have lasted had not the progress of civilization been promoted by the operator building a fine house at the county seat and by the lawyers and merchants in that same center following suit. Other causes for the change were the competition for miners and the advancing price of lumber.

In some places such houses are still rented. But nearly all the old mining towns have long since passed away and the newer towns, if not for humanitarian, at least for competitive reasons, have been better built. The walls of these dwellings are now plastered and wainscoted; the roofs are shingled, frequently with red cedar shingles, sometimes with slate, though tar paper is still not unknown. The walls after they become dirty are papered if the houses are occupied by English-speaking families. At the same time the price of lumber has risen and the labor required in erection has become more costly.

Only the rent is unchanged. That remains $2 per room per month in Eastern mine villages. It is now a fair compensation for the houses supplied. These are four-roomed dwellings and can be erected in large quantities for about $600. The water supply and fire protection, important items, are extra expenses. Such houses bring 16 per cent. per annum, when all losses and expenditures are not considered. This seems not a fair but a large compensation; but a little inquiry will show that it is by no means excessive.

The greater proportion of company mining villages do not last over 15 years, especially in western Pennsylvania, where the tonnage of a mine is large. It is true that some can be recalled which have been the seat of a post office for a much longer period, but the greater part of the time the mine has been running at much reduced capacity or is a poor producer at all times. Only a small proportion of the whole territory near large mines is working after 15 years, and as a result the houses are largely boarded up or pulled down and removed. A house which is plastered and has a cemented cellar is by no means removed with profit. It pays almost as well to erect a house from entirely new material.

So it is safe to reckon the obsolescence charge on a house as 6⅔ per cent. Deducting this from the profit of 16 per cent., only 9⅓ per cent. remains, and from this must be deducted loss of rent from empty houses, repairs, betterments, taxes, insurance, fence-building and whitewashing, collection, bad debts, uncovered fire losses, village improvements, garbage collection, supervision, the replacing of overcharged cesspools, general sanitation, etc.

In cases where betterment plans are somewhat generally forgotten, the first five items are the chief ones. Even where the company is somewhat negligent repairs are frequently not to be overlooked. A Polander has been known in drunken moments to light a fire on the floor. The protecting boards between the posts supporting the house have been torn away for a cowshed and legends have been painted on the house front. Doors are broken and split, locks wrenched loose, windows broken and steps and stairways are hatchet worn. This cuts the profit down close to 6 per cent., or even lower.

But 5 per cent. is a bonanza for many bituminous coal operators. If only they could do as well at mining coal they would be wondrous glad. We should not be surprised when we hear them say that the houses and the store saved the day. We should not necessarily infer either that the day *had been* saved, as ordinary business would view it, or that in saving it the houses and store had yielded an unfair profit.

And it must be remembered that your operator is often blind and overlooks the needful amortization of nearly 7 per cent. In fact he is blind enough sometimes to brag a little when he is really losing money because he forgets the time when the whole property value will be wiped out and shuts his eyes to the possibility of rows of idle houses in the future.

The house problem is not settled by any means. It is not clear that a fair rent solves the problem. The National Housing Commission advocates a better house. Americans should live in houses with stationary washtubs, bathrooms and other conveniences, and there should be an adequate porch front and back. There should be good water in every house. But in that day rents in mining towns will be almost as high as in villages with private ownership.

The United States Coal & Coke Co. is giving a good 6-room house, with bathroom and a good cellar with coal bins, to some of its employees for $12 a month. These houses have a hot-air furnace and are wired for electric lights. Such houses, which in boroughs would rent for $25 a month, cannot pay a fair rate of interest, any more than those at Concrete City which were erected by the Delaware, Lackawanna & Western R.R. Coal Department. The subsidiaries of the United States Steel Corporation are getting a fair price for their coal from the parent company and can afford to run their houses with a low return.

By prudence they may be able to increase the life of their towns and thus save amortization charges. The values of anthracite towns are less affected by the passage of time, as the coal is thick and beds numerous. But the houses of the companies mentioned are rented far below what would be charged for the same dwellings in an open town.

The miner who moves to a borough with private ownership usually has to pay a price a half larger or twice as large for a slightly better house. He really pays more for what he gets, for the landlord has greater costs of collection, larger taxes, more risk of bad debts and no cause to offer inducements to the tenant. He has no coal he wants to see dug. He is only looking for rent, not for workingmen.

The remark of Mr. Archbald that men are compelled to rent houses really does grieve the fairminded man, for an operator is surely justified in hiring men who will rent from him when he has a string of idle houses which have often been built solely in order that his men might be accommodated. Would any reasonable man ask him to sustain a dead loss on his property year by year because the men prefer a cheap shack on the outskirts of his village to a reasonable house on the property built only for the benefit of employees and offering for rent at a fair price? One thing which makes rent so cheap in mining villages is the fact that a little discrimination in hiring keeps them full.

Rents are too low in mining towns and the houses not as fine as they should be. But until the miner is ready to pay more or legislation makes the operator face the problem rents and houses will both be much like they have been. The rents having become adjusted to the houses and the miner being opposed to a large rent, it is probable that the next decade will show less progress than the past.

⁂

The War on Shipping

It appears that up to June 30 511 merchant ships had been lost as a direct result of the war and that this amounted to a shrinkage of nearly 1,000,000 gross tons, or 2 per cent. of the world's available merchant tonnage. Of this Great Britain lost 609,934 and Germany 102,062, or nearly 3 per cent. of their combined tonnage at the beginning of the war. The remainder of the loss was shared by the United States and 12 other nations. So great an inroad on the carrying trade—a loss sure to increase as the months pass—has a serious bearing on freighting all over the world.

Particularly is this true when one recalls that the shipyards of Great Britain and Germany, together with those of France and Austria, launched in 1913 no less than 2,635,231 gross tons in merchant vessels and that these plants, as well as those of most neutral nations, are now confining their efforts exclusively to war and naval construction.

The United States is of course a notable exception, but the ocean carriers now being built in American yards, while promising well for their owners, are likely to relieve but little the demand there will be at the end of the war. Besides the seven or eight lake steamers now being fitted for the coastwise trade, there are only seven steam colliers in process of construction on the Atlantic seaboard, and two of these are for Baltimore shippers who plan to inaugurate a regular coal service to the Mediterranean.

When the new coastwise boats are added to those now available, there will be only about 30 steamers engaged in freighting coal between Atlantic ports. While these will undoubtedly be sufficient for coastwise needs they will be able only occasionally to supplement the sailing vessels now so numerously engaged in trade to South America.

It is therefore evident that what tonnage is being projected is as a mere drop in the bucket when compared with the tremendous losses sustained on the other side of the Atlantic. Merchant shipping is in for a long period of high rates, and this indeed may soon be one of the world's grave questions.

Resuscitation*

By W. S. Rountree†

SYNOPSIS—Electric shock attacks the lungs or the heart or both. If the heart is dead or quivering it cannot deliver blood and therefore oxygen, and so artificial respiration is vain. But if the heart is working and the blood is unaffected, assisted breathing will in all cases restore the victim to normal condition.

The prime need for those who have been suffocated by mine gases or shocked by the electric current is to bring an immediate supply of oxygenated blood to the vital center of the body, for its deprivation of oxygen for 10 minutes may injure beyond repair some of the important brain cells, in which case recovery is unlikely.

When spontaneous breathing has stopped from any cause artificial respiration is the most valuable means for bringing back a normal condition of the body. But all methods are not equally useful for this purpose, even though they may cause an equal ventilation of the lungs.

Circulation of Worthless Blood

Thus in simple asphyxiation, such as may be produced by electric shock, the nervous control of the muscles of respiration is temporarily paralyzed, while the heart continues to pump blood through the body. But this blood is not oxygenated by respiratory action, and the heart soon ceases to beat effectively and the victim dies from asphyxia. In such a case there is no poisoning of the blood, and ordinary air is all that the lungs need and artificial respiration, when applied, will supply it.

But if the victim is overcome by carbon monoxide, which is the principal poison found in the gases after an explosion and is the dangerous constituent of illuminating gas, oxygen should be used. Carbon monoxide, happily, does not form a permanent combination with hemoglobin any more than oxygen, but it unites with it or separates from it according to the partial pressure of oxygen and carbon monoxide in the air breathed.

The blood of a victim that has been exposed to carbon monoxide gradually becomes so saturated with the gas that it cannot readily absorb and therefore convey oxygen, and so the victim dies of asphyxia, not because the carbon monoxide is poisonous, nor because of lack of oxygen, but because the blood loaded with the monoxide is little disposed to be the vehicle by which oxygen is carried to the tissues.

If the victim is unconscious, but breathing in a normal manner, he may be allowed to inspire oxygen himself; otherwise artificial respiration should be performed and at the same time oxygen should be administered.

Electric shock may paralyze the nerves by which the muscles of the respiratory organs are controlled or it may do the same for the heart. When the heart is affected, it ceases to contract as a whole, but contracts in parts and apparently quivers, or "fibrillates." The action is so weak and ineffectual that it fails to keep the blood circulating, and death is the result. After such quivering has commenced no process yet discovered will restore the heart to normal action.

Alternating currents of high frequency applied to the heart increase the number of beats so that fibrillation, or quivering, does not occur. Oscillating currents of high potential materially aid in restoring the heart beat of dogs in conjunction with the perfusion of the coronary vessels with defibrinated blood. The evidence clearly shows that the higher the frequency of the current the greater the volume which can be delivered to the tissues without fatal results.

I have known a case in which a current of 6600 volts has passed through a man's body without killing him. On the other hand I have seen an alternating current of 110 volts cause instant death. While 200 volts is not ordinarily dangerous, any current of high voltage must be carefully dealt with if one would escape electrocution.

Crile and others have demonstrated that fibrillary contraction of the heart and respiratory paralysis are the chief causes of death from electric shock. Since the first cannot be cured, the hope of resuscitation lies wholly in proper treatment for paralyzed respiration. If the lungs are deprived of oxygen for 10 minutes, death ensues; so methods of resuscitation should be used immediately and continued till normal breathing recurs.

Schaffer Method Is the Best

The Schaffer method of artificial respiration is to be recommended as it is better than the Sylvester in that it is simpler and more easy to perform and provides greater ventilation of the lungs. It is also less likely to injure the ribs and liver. Moreover the tongue does not fall and block the air passages.

In treating electric shock the first-aid man must keep cool and follow instructions even if the victim appears dead. The electric circuit must either be broken or prevented from passing through the patient. This can be done by using a dry coat, a dry board or rubber gloves. The electric wire may be cut by an ax or properly insulated pliers or any other nonconductor. No metal or moist material should be used in endeavoring to rescue the victim. If his clothes are loose and dry, they may be used in pulling him off the wire, but in doing so use one hand and be careful not to touch the soles or the heels of his shoes as the nails in them are dangerous.

As soon as the victim is moved from the live conductor, a finger should be passed into his mouth and throat to remove all foreign bodies such as false teeth, tobacco or gum. The rescuer should not even stop to loosen the clothing, nor to remove the victim from the scene of accident, for every moment of delay is serious. Artificial respiration should be continued for two hours, or longer if necessary, and in most cases it will bring the victim back to a normal condition. But if the current has exerted its power mainly upon the heart and that organ has ceased to beat, artificial respiration, while it will do no harm, can do no good, as the victim is absolutely dead.

---

*Abstract of paper read before the Alabama Safety Association, May 1, 1915.

†Chief surgeon, Tennessee Coal, Iron & R.R. Co., Wylam Hospital, Wylam, Ala.

Several medical devices for causing artificial respiration have been marketed in recent years such as the Pulmotor, Lungmotor and the apparatus which Dr. Meltzer has devised, but as yet the cases treated with the devices do not furnish absolute proof of the value claimed for them.

The primary and essential object of resuscitatory methods is to supply the brain with a circulation of oxygenated blood. Cerebral anemia must be overcome within less than seven minutes or the patient will pass into a sleep which knows no awakening.

Keystone Coal & Coke Company Contest

The first-aid teams of the Keystone Coal & Coke Co., of Westmoreland County, will hold their fourth annual demonstration at Athletic Park on Sept. 4, the first Saturday in that month. General Superintendent H. F. Bovard and Chief Inspector William Nesbitt will be in charge of the meet and have announced that about 60 teams are expected to attend.

The big prize of the contest is the cup offered by the late Col. L. B. Huff. The cup must be won three years in succession. Crow's Nest won the prize at one of the meets, and Arona won the last year's contest with an average of 100 per cent. and has therefore established a claim on the cup. Several hundred dollars in cash will also be included in the list of prizes.

One Operator's Experience with the Liquor Problem

The following letter, from the Pittsburgh *Gazette*, has been sent by a subscriber, who requests that it be published:

> At our works we have a mixture of races, as I have never believed in employing too many of any one nationality, although in the case I am about to relate, the mixture soured somewhat. About six months ago, shortly after the European war started, a number of our men one evening congregated at one of the houses for a little drinking bout, during which the trouble across the water was of course discussed, with the result that might have been expected—a free-for-all fight in which one man was shot and seriously wounded. The shooter, a fine workman, got away and is still away, and our entire force was disorganized for several days.
>
> ### SUPERINTENDENT MADE A PERSONAL PLEA
>
> This set me to thinking. I realized that the same thing was liable to happen every time any number of our employees got together where there was booze, and I finally decided to try the "water-wagon" plan. I had a list of those who regularly ordered beer and whiskey and I went personally to each man. I called attention to the shooting scrape and the resultant trouble and told them I had decided to ask them not to order any more intoxicants during the progress of the war; that while I had no intention of interfering with their personal privileges, this was a matter that concerned the good of the entire community and I felt justified in making the request. A large majority of the men received the proposition favorably. A few, however, rejected it on the ground that their rights were being interfered with. These men are not now working for us; they are exercising their rights and doing their drinking at some other works.
>
> The result of the new order of things was a surprise to me. I had expected an improvement in conditions, but nothing to what happened. Right from the start we had no shortage in our labor supply; everybody was on the job; the men worked regularly; the usual "sick" list after lay-off days and Sundays was entirely wiped out; the coal came without a hitch, the ovens were charged in good time and everything moved along swimmingly.
>
> ### MINERS WANTED MORE WORK
>
> A little later several of the miners came to me and complained that they were not getting enough wagons to load. I investigated and found they were doing somewhat better than before the "reformation" started, and told them so.
>
> "Me know," said a big Hungarian, "but want more wagon," and throwing out his chest and spreading his arms continued, "Me feel better no booze, want work all time now; can load one, two, mebbe three more wagon; loaf too much in pit now."
>
> I promised to see what could be done and immediately went over the roll. I found a number of undesirables and weeded them out, and today we are operating our plant with 25 per cent. less men than when the war began, are getting done in better time, the men are in better condition physically and mentally and everything in general has improved wonderfully.
>
> I believe, too, that the "reformation" is going to stay with us. Several of our hardest drinkers have told me that they are through with booze for all time. This sentiment is spreading among our people and we are encouraging it in every way.
>
> ### TEMPERANCE HAS ELIMINATED ACCIDENTS
>
> But the most gratifying result lies in the practical elimination of accidents in our mine. Heretofore it was almost a daily occurrence to have somebody injured. Most of the accidents were not serious, but they showed thoughtlessness and carelessness. They were disquieting and a continual jolt to the operation of the plant. Now, however, the men are going about their work intelligently. During the last six months we have not had a man hurt either inside the mine or out, and I want to tell you that a condition of that kind makes the man in charge feel mighty good.
>
> Of course should there be a general resumption in the region there would be a shortage of labor. This has always been the case after an extended shut-down, and just now the war aggravates the situation, as the workers who are abroad cannot return. However, if the operators generally were to adopt my plan, I am satisfied that the effects of this labor shortage would be much less serious than appears on the face.

Somerset County First-Aid Meet will be held Sept. 4

The Somerset County Miners' First-Aid Meet, which has heretofore been held at Somerset, Penn., will assemble this year at Boswell, Penn., on Sept. 4. This will give a much larger number of miners an opportunity to attend the meet. Already preparations are being made to make this a holiday and a gala day. The Public Welfare Association has agreed to coöperate to this end.

Fifteen teams have promised to compete—the Consolidation Coal Co. teams at Meyersdale, Pine Hill, Shaft No. 123, Jenners and Acosta, the Merchants Coal Co. teams at Boswell, the Jenner-Quemahoning Coal Co. team at Jerome, the Quemahoning Coal Co. team of Ralphton, the Victor Coal Co. team at Holsopple, the Brothers-Valley Coal Co. team at Macdonaldton and the Knickerbocker-Smokeless Coal Co. team at Hooversville.

There will be events for one, two and three men and a full-team contest. Rules and discounts will be similar to those of last year. Contests for ladies' teams and for teams of boys from mining towns have been requested. Prizes will be offered as heretofore, and the American Mine Safety Association and the American National Red Cross are coöperating and will give their medals and certificates to the winners. An expert from the United States Bureau of Mines will aid in training the men before the meet takes place.

This meet, as those in the past, will be held under the auspices of the mining department of the state Young Men's Christian Association of Pennsylvania. The members of the local committee in charge of the Somerset first-aid meet are: F. W. Cunningham, state mine inspector, Somerset, Penn.; Samuel Steinbach, Somerset; Richard Maize, Jerome; John Gibson, Jr., Boswell; Ralph Zimmerman, Ralphton. It is not too late for other teams to enter. As there are 49 separate mining operations in Somerset County, many more entries should be received.

Discussion by Readers

The Pennsylvania Amendment

The mine foremen, assistant foremen and firebosses in Pennsylvania, who have qualified for the positions they hold by passing the examination, and who hold the certificate of competency granted them by the state examining board, have been much exercised of late by the passage of an amendment to the mining law providing for the employment of uncertified men in these positions.

A careful survey of the situation, however, warrants the conclusion that such fears are largely groundless. The general opinion seems to be that persons who desire to act as mine foremen and firebosses will continue to take the examination and receive certificates from the Department of Mines, as before, although the operators will have the right to select persons to act as mine foremen, assistant mine foremen and firebosses from the uncertified workers, while, at the same time, they assume responsibility for all official acts.

It may be stated with assurance, however, that there will not be many uncertified men employed in such official capacities, as coal operators will largely prefer to engage men who hold a state certificate of competency. There will, of course, be a few exceptions where an old employee has proven very valuable in the service of the company by reason of his long experience, efficiency and good character, and the company, being fully satisfied with his previous record and willing to assume all responsibility for his future acts, desires to retain him in its service in an official capacity, notwithstanding the fact that he has not passed the examination, owing to a lack of technical knowledge, and does not, therefore, hold a certificate of competency under the state law. It is recognized that the failure to hold such a certificate is, in a number of instances, due to the lack of early education, or a want of familiarity with the English language sufficient to enable a candidate to make a creditable showing in examinations.

Value of Coal Analyses

Letter No. 4—I have just read Bykem's letter, *Coal Age*, July 10, p. 60, and am pleased to note that he comes a little nearer to my idea than did Mr. Coupland in a previous letter.

Bykem argues, however: "To impose this duty of testing coal on the mine operator, as suggested by Mr. Near, is hardly just unless his commodity can be sold at an increased price."

Very well; let the mine operator charge a little more for his coal, if necessary. He would then be doing no more than what the coal-sales agency is doing now. Any sales agency must certainly have to charge a little more on account of the analysis. My suggestion is to make only one analysis, and that a reliable one. I believe this should be made by the party mining the coal.

Or a certain mine could sell all of its coal to one sales agency and trust that agency to make the necessary analyses. If the analyses are correct and the coal is sold on a heat-unit basis, the desired end will be accomplished, the cost to the consumer will be less, and he will be reasonably sure of getting the kind of coal suited to his purpose.

N. G. Near.

Sampling Coke

Letter No. 1—Referring to the inquiry in regard to sampling coke, *Coal Age*, July 3, p. 28, permit me to draw attention to a point that is of utmost importance in the sampling of coke for blast-furnace use. I refer to the ash determination, since every pound of ash in a ton of coke means more expensive fluxing, increased cost of smelting, useless cinder and less furnace capacity available for the production of metal. For this reason differences of opinion as to the ash content of coke for blast furnace use often cause bitter controversies.

In an investigation of this subject several years ago, I was surprised to find how much of the apparent ash content of coke was due to foreign material introduced in the process of grinding the sample. For instance, the analysis of a sample reported as containing 17 per cent. of ash showed that $^1/_{17}$ of this ash, or 1 per cent. of the weight of the sample, was iron abraded from a Braun pulverizer. It may be stated that the ordinary cast-iron bucking-board and muller much used in grinding samples to be tested introduces iron into the sample to the extent of from ½ to 3 per cent.

Whether the grinding be done by machinery or by hand, this introduction of foreign matter in grinding can be cut down greatly by the use of manganese- or chrome-steel grinding plates.

As the seller of coke is vitally interested in the ash content of his product, it will pay him to look up this matter and see that his own sampling machinery as well as that of his customer is of the best possible quality. In case the customer is grinding samples on an ordinary cast-iron plate that perhaps is so old that the surface chill has worn through, it may pay the seller to make his customer a present of a new bucking-board.

It is impossible to determine the amount of this contamination with a magnet, for the reason that too much coke dust will adhere to the iron filings. It is necessary to treat the sample with a neutral copper-sulphate solution, agitate thoroughly, filter and wash the residue with hot water until entirely free from soluble copper salts. This residue is now dried and ignited and the ash tested for copper or treated directly with nitric acid to dissolve the copper. The weight of copper precipitated by the iron in this process is then calculated from the ratio of their respective atomic weights.

This method will not answer for the determination of any foreign material introduced by ball or pebble mills, but is very effectual where the grinding surfaces are of iron. It may be objected that the original ash of the coke may have contained some iron which has been reduced to the metallic state by the red-hot carbon of the coke during the coking process. In answer to this argument, however, it may be stated that any iron in the coke is present as ferrous oxide and combined with silica to form ferrous silicate ($FeSiO_3$). But in any event the objection is scarcely valid, because if the coke sample is crushed in a silica-pebble mill or in an agate mortar, the iron in the coke does not react with neutral copper-sulphate solution, according to my results.

The Mine-Lamp Question

Letter No. 1—I want to offer a few comments urging the need of better illumination in mine workings, particularly at the working face. Much can be said to discredit the common open-light oil lamp used by a majority of miners. In my opinion this lamp should be consigned to the rubbish heap, where it rightfully belongs. It is unsanitary and often dangerous. Its light is uncertain, and although giving a better illumination than that afforded by the dim light of the safety lamp, it cannot be compared in this respect with the light of the electric mine lamp, which is being largely introduced in uptodate mines at the present time.

Not long ago the experiment was made of comparing the wages or earning power of the miners working in two districts under similar conditions, except that the mines in one case were lighted with portable electric lamps used by the miners, while the men in the other district worked with other lamps, using either the common open light or the safety lamp. The results of this experiment were decidedly in favor of the electric light.

The brighter light afforded by the electric lamp not only increases the earning power of the miner, but overcomes the objection often urged that the dim light under which miners are forced to work is a large factor in developing the disease known as "miner's nystagmus." I remember that a very interesting discussion was conducted in *Coal Age* some time since (Vol. 4), when facts were stated by some showing that the continued use of the Davy safety lamp by firebosses tended to develop and increase this disease, although the opinion was advanced by men who had used the lamp continuously for many years that such continuous use had no effect on healthful eyesight.

In my experience it has been found that the introduction of lamps having a greater illuminating power has been followed by a decided reduction in the number of nystagmus cases among men working in the mines. Men in my charge who were affected with this disease or even suspected of developing nystagmus were invariably furnished with an electric lamp. The testimony of these men is unanimous to the effect that they can do better work with greater comfort than with the old light and that on going home they can read the newspaper without its producing headache or affecting the eyes as formerly.

I also believe that where men are furnished with a clean and better light the number of accidents is greatly reduced and the general health of the men improved. It is freely admitted that the first cost of electric mine lamps is comparatively high. Also, where the mine is not equipped with an electrical system, it is necessary to install a generator or purchase electric current to recharge the lamps. To offset this, however, it may be stated that with proper use and care the lamps do not get out of order.

An important feature that commends the use of the electric lamp is that it does not consume the oxygen, which is the vital element of the atmosphere, and does not smoke or generate gas to vitiate the mine air. Such lamps as have passed the test of the United States Bureau of Mines and are classed as "permissible" can be regarded as safe for work in gaseous or dusty atmospheres. It can also be stated that the electric current necessary to operate these lamps costs less than oil, giving at the same time an excellent light. Wherever they have been installed and given a fair trial, they are held in high esteem for general mine use. It must be admitted that the chief disadvantage of the electric mine lamp is in its inability to reveal the presence of gas in the mine air. I would suggest, however, that this loss can be overcome by competent firebosses making regular examinations of all places in a mine generating gas.

On the other hand, oil lamps, though cheap in respect to first cost, consume much of the oxygen of the air and often smoke owing to the fact that they can be made to burn almost any kind of oil or grease found about the mine. Where such lamps are in use, the air frequently becomes foul with the smoke and gases produced by the lamp. Much fine carbon is deposited on the timbers and the walls of the mine. The open flame of the lamp is dangerous wherever gas is generated or the mine particularly dusty. Numerous fires in mines have been traced to the use of the open light, the flame of the lamp coming in contact with canvas, hay, oil-soaked timbers or dry brattice boards. A discarded smoldering lamp wick thrown into a corner may start a fire in oily waste or other combustible material.

In conclusion, I want to say that when one considers the large number of accidents that have resulted in the loss of precious lives and which have been caused directly by the careless use of an open light, it is clear that we are playing a game of chance in the mines every day that we continue to use such lamps. In the interest of the Safety-First idea, which is being preached and practiced so extensively today, I would urge that it is high time that we recognized this great menace to life and property in the operation of coal mines and deal with it as it deserves.

Rotary Converter vs. Motor-Generator Set

Letter No. 2—The article on this subject, by T. R. Hay, that appeared in *Coal Age*, May 22, p. 880, has just come to my attention. There are several statements made in this article in reference to design, operating characteristics and the application of the various types of machines that are quite misleading.

The fact that the author limits his discussion to this type of apparatus as applied to coal-mining work would suggest that the size of the units considered, whether rotaries or motor-generator sets, does not exceed a maximum of 400 kw., while the average size of the unit employed would probably be about 150 kw. This limitation of size of unit makes some of the author's statements not applicable to the conditions he is considering. For instance, booster rotaries are never built in such small sizes, but are used exclusively for central-station work and have a minimum size of about 1000 kw.

What the author says in regard to the application and limitation of the different types of transforming apparatus is also misleading, as it is prejudiced against the rotary converter. A rotary converter or a motor-generator set, of either the synchronous or induction-motor type, has a definite field of application where the best results are obtained. Under conditions that permit the suitable regulation of power supply, and where the arrangement is such that an increase in the direct-current voltage at terminals of machine, due to increase of load, is unnecessary the rotary converter is the best type of machine to employ; but such an application should not be made offhand without thoroughly understanding all the limiting conditions.

The synchronous motor-generator set is advisable when the power conditions on the supply circuit are good, and where independent regulation for overcompounding of direct-current voltage is necessary; but if the power-supply conditions are bad the induction motor-generator set will give better results. It must be remembered that while the synchronous motor-generator set has the desirable feature of permitting power-factor adjustment, such an adjustment may prove of advantage or otherwise, depending on the conditions. It is seldom of much use at a central station, without suitable control in respect to the use of power by the consumer. The rotary converter has this same feature of power-factor correction, but in a more desirable degree. In this converter the necessary adjustment can be made permanent so that the power-factor correction will vary with the load, thus always giving the best results with varying load.

In regard to the overload capacity of different types of machines, the modern rotary converter, which is equipped with commutating poles, is capable of carrying momentary loads as high as 300 per cent., while the modern direct-current generator is limited to an overload capacity of only 200 per cent. This advantage of the rotary converter is inherent in that type of machine. In mining practice, especially where locomotives are employed, such momentary overloads are frequent, and substation equipment in coal mining is generally selected with this fact in mind, the limit being the commutation of direct-current machines.

Rotary converters are now designed for 60-cycle service, and give much more satisfactory operation than the 25-cycle machine of a decade ago. The starting of a rotary converter is no more complicated than that of a synchronous motor-generator set, the apparatus being practically the same in each case. Synchronizing is now no longer necessary, which eliminates that objection.

In respect to the total cost it may be stated that, with a few minor exceptions, a rotary converter and its transformers will be cheaper than a motor-generator set of either type. It is worthy of note that the cost for power-factor correction is generally of minor importance to the coal operator, while the cost of installation is his first consideration. It is well to remember that, in addition to the cost of the apparatus, there is the expense of building the substation underground and installing the machinery therein. In this connection, there is a particular advantage in the smaller size of a rotary converter and its switching apparatus, which require less room and a smaller outlay for building the substation.

Where a large direct-current installation is necessary it will be found more economical to have two or more properly located substations with minimum of feeder copper instead of using one substation, requiring an excessive amount of feeder copper and causing large variations in direct-current voltage. With a proper distribution of feeder wires the direct-current voltage will be maintained at a higher average, giving an increased output by the locomotives and costing less for maintenance of auxiliary machinery. In considering a number of substations, the total cost of building, operation and attendance must be taken into account. Substations can often be so located as to combine the attendance of the substation with that of a fan or pump, and thus reduce the expense.

I do not wish to be understood as advocating the general application of rotary converters for coal-mine substations under all conditions. When the conditions are favorable, however, the first cost of the entire equipment and installation will generally be lower, its maintenance no higher, and the overall efficiency much greater than that of motor-generator sets. It may be stated that a more thorough analysis of the engineering features of an installation of rotary converters is necessary than when using synchronous or induction motor-generator sets.

As an illustration, I may cite a company that controls a group of mines in West Virginia and has recently ordered 24 rotary converters, which are to replace former direct-current generating stations, several substations being frequently replaced by a single generating station. In this case, a thorough study was made of all the operating conditions, and the substations were located sometimes on the surface and sometimes underground, with the view to maintaining as nearly constant voltage on the network of trolley lines as possible. To increase the safety of operation the voltage in use was reduced from 500 to 250 volts. But even with this lower pressure the regulation will be better than with the former high-voltage system employed.

⁂

Preventing Mine Explosions

Letter No. 3—My attention was attracted by the statement of Mine Inspector Rose, *Coal Age,* May 8, page 819, where he asserts, "As long as coal is mined disasters must occur."

It is true that mining accidents and disasters have been regarded in the past as incidental to coal production. Most of the opinions expressed as to the occurrence of mine explosions indicate that in the large majority of cases they are the result of carelessness or inefficiency in the management and operation of the mine. This fact alone should be sufficient evidence that it is possible to remedy this great evil. To my mind the statement of Mr. Rose is dangerous and invites the recurrence of mine disasters, which he predicts are inevitable. It shows, however, that mining men are for the most part indifferent if not wholly apathetic in respect to many live and vital questions in mining, upon the solution of which depend thousands of lives each year.

I am not appealing to sentiment solely, but want to urge that the study of this question is a business proposition and should be recognized as such by all engaged in the mining of coal. Human lives are too sacred to be sacrificed on the altar of carelessness, ignorance and inefficiency. It may take a number of years to discover an effectual remedy that will wholly avert the occurrence of mine explosions, but this should not prevent the careful consideration and adoption of any palliative measures that will tend to reduce the frequency of mine explosions.

In my opinion, the true solution of this question lies in a higher sense of duty among mining officials and a more thorough and intimate knowledge of the elementary principles of mining by the rank and file of mine operatives. Attention has well been drawn to the great need of the education of mining men and of coöperation on the part of every mine worker and mine official. Instead of asserting that "as long as coal is mined disasters will occur," we might rather say that as long as mines are operated in a careless and inefficient manner disasters are liable to happen at any time.

Permit me to refer to one instance that will show what can be accomplished where care is exercised in the operation of the mine. Some may regard it as a result of luck or because of particularly favorable conditions in the mine workings, but I consider it is owing entirely to the great care and precaution that have been exercised in this operation. The mine to which I refer employs 800 men underground, and during the past two years there has not occurred a single fatal accident at the working face. Only a complete system of organization can effect such results. Such a record shows that the mine management has made a determined, intelligent and successful effort to render the mine as safe and the operations as efficient as is humanly possible.

In closing, I want to suggest a few points, the observance of which will greatly reduce if not entirely eliminate mine accidents. They are as follows:

1. Employ none but thoroughly trained and competent mine officials to take charge of operations underground.
2. Let all mine officials meet regularly, say once a month, to compare notes, exchange opinions and discuss plans for greater coöperation in their work.
3. Provide for a closer, more frequent and thorough inspection of all mining work.
4. Provide ample opportunities for the education and training of miners, by which they may become thoroughly familiar with the principles involved in their work. I believe that what man has done, man can do, and as accidents have been reduced to a minimum by the exercise of greater care and precaution in one mine, it is possible to do the same in other mines.

William Crooks.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

VOLUME OF AIR AND GASES

The volume of any given weight of air or gas depends on two factors—the temperature of the gas and the pressure it supports.

Effect of Temperature—For any given weight of air or gas, its volume varies directly as its absolute temperature, assuming the pressure remains constant.

Effect of Pressure—For any given weight of air or gas, its volume varies inversely as the pressure it supports, assuming the temperature remains constant.

Expansion and Contraction of Air or Gases—Any change in temperature or pressure causes a corresponding change in the volume of the air or gas, as follows:

Increase of temperature causes expansion.
Decrease of temperature causes contraction.
Increase of pressure causes contraction.
Decrease of pressure causes expansion.

Coefficient of Expansion or Contraction—The cofficient of expansion is the same as that of contraction. This coefficient is practically the same for all gases and air and is independent of the pressure.

The coefficient of expansion of air or gas is the ratio of the increase in volume to the original volume, for an increase of one degree in temperature. Since a degree of the Fahrenheit scale is 5/9 of a degree of the centigrade scale, it is evident that the Fahrenheit coefficient of expansion will be exactly 5/9 of the centigrade coefficient. These coefficients are as follows: Centigrade, 0.003663: Fahrenheit, 0.002035.

Illustration—Let it be required to find the increase in volume in an air current of 100,000 cu.ft. entering a mine at a temperature of 32 deg. F. and discharged at a temperature of 68 deg. F.

Solution—The rise in temperature is 68 — 32 = 36 deg. F. The increase in volume, calculated by the Fahrenheit scale, is

$$100{,}000 \times 0.002035 \times 36 = 7326 \text{ cu.ft.}$$

Or, since 68 and 32 deg. F. correspond to 20 and 0 deg. C., the rise in temperature is 20 — 0 = 20 deg. C., and the increase in volume, calculated by the centigrade scale, is

$$100{,}000 \times 0.003663 \times 20 = 7326 \text{ cu.ft.}$$

Note—Instead of multiplying by these coefficients, it is possible to divide by their reciprocals, which are

$$\text{Fahrenheit,} \quad \frac{1}{0.002035} = 491.4, \text{ say } 492$$

$$\text{Centigrade,} \quad \frac{1}{0.003663} = 273$$

These numbers, being divisors, show that air or gas expands or contracts 1/273 of its volume, for each degree rise or fall in temperature (centigrade); or 1/492 of the same volume for each degree rise or fall in temperature (Fahrenheit). The figures point to what has been called the "absolute zero" of temperature scales as being 273 deg. below freezing (centigrade) or 492 deg. below freezing (Fahrenheit).

The Coal Age Pocket Book

Absolute Zero—The so-called "absolute zero" of temperature scales is based on the observed rate of expansion and contraction of all gases and air. This rate is practically 1/273 of the volume, per degree centigrade; or 1/492 of the volume, per degree Fahrenheit. It is clear that if this rate continued unchanged a fall in temperature of 273 deg. C., or 492 deg. F., below the freezing point of water, would reduce the volume of the gas to zero, when all molecular vibrations would cease, indicating a total absence of heat and pressure.

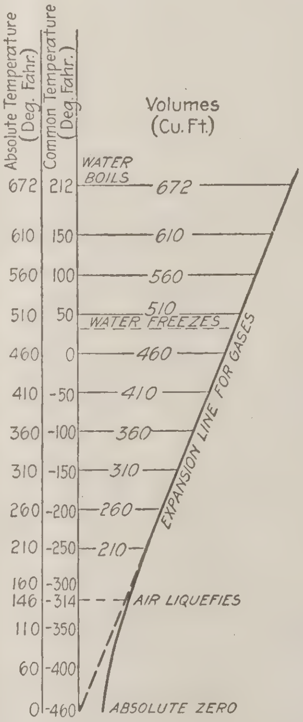
The absolute zero has therefore been fixed at 273 deg. below the common zero of the centigrade scale (—273° C.), which corresponds to 460 deg. below zero on the Fahrenheit scale. The fixing of this point is purely arbitrary, its chief value being the facility it affords in the calculation of gaseous volumes with respect to temperature.

Absolute Temperature—Absolute temperatures differ from common temperatures only in being estimated from the absolute zero. Hence the absolute temperature is obtained from the common temperature by adding 273 in the centigrade or 460 in the Fahrenheit scale; thus,

30 deg. C. = 273 + 30 = 303 deg., absolute.
60 deg. F. = 460 + 60 = 520 deg. absolute.

Relation of Volume and Absolute Temperature of Air and Gas—The law commonly known as **Gay Lussac's or Charles' law** makes the volume of all gases and air, under constant pressure, vary directly as the absolute temperature.

This relation is clearly illustrated in the accompanying figure, which assumes a volume of 460 cu.ft. of air or gas at 0 deg. F., corresponding to the absolute temperature at that point. It will be observed that this volume expands and contracts exactly as the absolute temperature rises or falls, except at the lowest temperatures approaching the liquefaction of the air or gas where the law naturally fails, owing to the changing state of the matter.



Inquiries of General Interest

Pennsylvania Mine Law Amended

There has been much discussion recently in regard to the amendment of the Pennsylvania mining law relating to the need of certification of mine foremen and other mine officials. It is claimed that this amendment so modified the present bituminous law that coal companies are now permitted to hire persons to act as mine foremen, assistant mine foremen or firebosses who have not passed a state examination and do not hold a certificate of competency, as was heretofore required by law.

Will you kindly explain this amendment, stating its effect and purpose?

INQUIRER.

——, Penn.

The law to which correspondent refers is an act amending art. 4, sec. 1; art. 5, sec. 1, and art. 24, sec. 9, of the bituminous mine law of Pennsylvania. This amendment passed by the last legislature was approved by Governor Brumbaugh, June 1, 1915.

The action taken by the legislature came as the result of the difficulty arising in the adoption of the new Workman's Compensation Act in the state. This act imposes on all operators working under its provisions a liability for death by accident or for injury sustained by workmen while performing their duties in and about the mine. There has always been some contention as to how far the authority of the company extended over the actions of the mine foremen and firebosses in their employ. The reading of the bituminous mine law (1911) gave the foreman "full charge of all the inside workings and of the persons employed therein." The law also gave the fireboss virtual control over the operation of the mine, in respect to dangers arising from the accumulation of gas.

In connection with the new compensation law, it has been objected by the operators that if they were to be held liable for accident to mine workers, they must be permitted to employ mine foremen, assistant mine foremen and firebosses who in their judgment are capable of performing the duties imposed on them by law and of operating the mine safely and economically.

The following extracts from those sections of the law to which reference has been made will show the changes made in the wording of the law and the additions thereto. Where the words have been omitted or changed, this will be indicated in a footnote giving the original wording of the law. Additions made to the reading of the old law are marked by parantheses. It will not be necessary to repeat the entire sections of the law, but a series of dots, or ellipses, will show where portions are omitted which are identical with the old law. The amended sections are the following:

Art. 4, sec. 1. In order to secure efficient management and proper ventilation of the mine . . . the operator or the superintendent shall. employ a competent and practical mine foreman . . . (who shall be under the supervision and control of the operator). The mine foreman shall have full charge of all the inside workings and the persons employed therein, (subject, however, to the supervision and control of the operator), in order, etc. . . . If the mine is generating explosive gas . . . the mine foreman must possess a first-grade mine-foreman's certificate, (or be a person who, in the judgment of the operator, is a person equally competent with the holders of such certificates). If the mine is nongaseous the mine foreman must possess either a first-grade mine foreman's certificate, or a second-grade mine foreman's certificate, (or be a person who, in the judgment of the operator, is fully competent with the holders of such certificates).

When the mine workings become so extensive that the mine foreman is unable, etc. . . . he shall have the right to employ a sufficient number of competent persons to act as his assistants, who shall be under his instructions (and the operator's instructions) in carrying out the provisions of this act. If the mine is generating explosive gas . . . the mine foreman's assistants must possess first-grade assistant mine foremen's certificates, (or be persons who, in the judgment of the operator, are equally competent with the holders of such certificates).

In case of the necessary temporary absence of the mine foreman, he may deputize . . . his assistant, who shall perform all the duties of the mine foreman; (and have the right to hire and discharge employees; the management of the mine and the direction of the working forces are vested exclusively in the operator; and no person or persons, association or associations, organization or organizations, corporation or corporations, shall interfere with or attempt to interfere with, abridge or attempt to abridge, in any manner whatsoever, such right; provided, that this act shall not invalidate any existing contract).

Art. 5, sec. 1. In such portions of a mine wherein explosive gas has been generated . . . the mine foreman shall employ a fireboss or firebosses, whose competency to act as such shall be evidenced by a certificate of qualification from the Department of Mines on the recommendation of the examining board, as provided for in sec. 6, art. 24 of this act; (or a person or persons who, in the judgment of the operator, is equally competent with the holders of such certificates). It shall be the duty of the fireboss to examine carefully, etc. . . . The examination shall begin within three hours prior to the appointed time[1] to enter the mine. The fireboss shall examine for danger, etc. [No further change in this section.]

Art. 24, sec. 9. It shall be lawful[2] for any operator, manager or superintendent to employ as mine foreman in any mine, or as assistant mine foreman in any gaseous mine, any person who has obtained the proper certificate of qualification or service required by this act, (or any person who, in the judgment of the operator, is equally competent with the person or persons who are the holders of such certificates); provided, that all persons holding certificates etc. . . . and it shall be unlawful for any operator, manager, superintendent or mine foreman to employ as fireboss any person who has not obtained the proper certificate of qualification required by this act, (or a person who, in the judgment of the operator, is equally competent with the person or persons who are the holders of such certificates); provided, that all persons holding certificates, etc. [No further change in this section.]

This act shall not go into force or become operative until the first day of January, A. D. 1916.

All acts or parts of acts inconsistent with this act are hereby repealed.

The changes made in the reading of the bituminous law (1911) are not as drastic as may at first appear. On sober, second thought they are only such as are reasonable when considered in connection with the obligations imposed on the operator of a mine by the provisions of the Workmen's Compensation Act of 1915.

---

[1] The words "for each shift," in the old law, have been dropped from the amendment.

[2] The old law reads "unlawful."

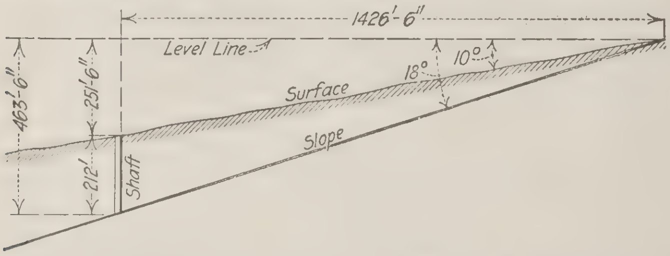
Examination Questions

Miscellaneous Questions

(Answered by Request)

Ques.—A seam of coal 8 ft. thick crops out at the north line of a tract of land. The seam dips 18 deg. south, while the surface has a regular dip of 10 deg. in the same direction. How far south of the north line must you go to sink a shaft so that it will cut the seam at a point 1500 ft. measured on the pitch from the crop, and what will be the depth of the shaft from the surface to the bottom of the slope?

Ans.—Since the seam has a regular dip of 18 deg., the horizontal distance, corresponding to a distance of 1500 ft. measured on the pitch of the seam, is $1500 \times \cos 18 \text{ deg.} = 1500 \times 0.951 = 1426.5$ ft., as shown in the accompanying figure. The elevation of the surface at this distance from the crop line for a regular dip of 10 deg. in the same direction is $1426.5 \times \tan 10 \text{ deg.} = 1426.5 \times 0.1763 = 251.5$, as indicated in the figure. The corresponding elevation of the foot of the slope or bottom of the shaft can now be found in two ways:



$$1500 \times \sin 18 \ deg. = 1500 \times 0.3090 = 463.5 \ ft.$$
$$1426.5 \times \tan 18 \ deg. = 1426.5 \times 0.3249 = 463.5 \ ft.$$

The elevation of the surface at the shaft, and that of the shaft bottom, as thus found, are the respective vertical distances of these points below the crop line at the surface. The depth of the shaft is found by subtracting the surface elevation from that of the bottom of the shaft. Thus $463.5 - 251.5 = 212$ ft.

Ques.—If a pump will lift water 34 ft. at sea level, with a barometer reading of 30 in., how high will it lift water at an altitude of 5400 ft.?

Ans.—This is not a fair question to ask candidates in examination, unless they are permitted the use of textbooks or are given the corresponding barometer reading at an elevation of 5400 ft. above sea level. The barometer reading for this elevation, under normal atmospheric conditions, as taken from tables, is 24.5 in. The draft of the pump, as given for sea level (34 ft.) is the theoretical suction or lift. The corresponding lift at an altitude of 5400 ft., assuming a barometer reading of 24.5 in., is

$$\frac{24.5}{30} \times 34 = 27.6 \ ft.$$

In practice a common rule for determining the suction or lift of a pump is to estimate the lift in feet as nine-tenths of the barometer reading in inches, or in this case: At sea level, $0.9 \times 30 = 27$ ft.; at an altitude of 5400 ft., $0.9 \times 24.5 = 22$ ft.

Ques.—The grade of an incline is 7 per cent.; the length of the incline is 2000 ft.; the weight of the rope 4000 lb.; the weight of the full car 1800 lb. How many cars must there be in a trip to make this plane self-acting?

Ans.—The force acting to produce motion on a self-acting incline is the unbalanced weight of the coal in the loaded cars, the weight of the cars themselves being balanced on the two sides of the incline. The forces resisting motion are the unbalanced weight of the rope when the empty trip is at the bottom of the incline and the friction pull of the entire moving load, which includes the weight of the loaded and empty cars and that of the rope.

The question does not state the weight of the empty car, which must therefore be assumed as, say 600 lb. This makes the weight of coal carried in each car $1800 - 600 = 1200$ lb. Calling the number of cars on each side of the incline n, the weight of coal in a single trip is $1200 n$, and the corresponding gravity pull producing motion on a 7 per cent. grade, is, therefore, $1200 n \times 0.07 = 84 n$ lb.

The gravity pull of the rope, which resists motion, is $4000 \times 0.07 = 280$ lb. Taking the weight of a loaded car as 1800 lb. and that of an empty car as 600 lb., the total weight of one loaded and one empty car is $1800 + 600 = 2400$ lb., and the total moving load on the incline, including that of the rope, is $2400 n + 4000$. The friction pull may then be assumed as $^1/_{40}$ of the load, which gives

$$\frac{4000 + 2400 n}{40} = 100 + 60 n.$$

Then, equating the gravity pull of the coal with the gravity pull of the rope and the friction pull of the entire moving load, gives

$$84 n = 100 + 60 n + 280$$
$$24 n = 380$$
$$n = \frac{380}{24} = say \ 16 \ cars.$$

Under the assumed conditions, therefore, there are 16 loaded and 16 empty cars, making a total of 32 cars on the incline.

Ques.—What units of work are necessary to overcome the friction of an airway 6 ft. square, 1000 ft. long, when the quantity of air passing is 10,800 cu.ft. per min.?

Ans.—The perimeter of this airway is $4 \times 6 = 24$ ft., and its rubbing surface $24 \times 1000 = 24{,}000$ sq.ft.; its sectional area is $6 \times 6 = 36$ sq.ft. The velocity of the air current in this case is $10{,}800 \div 36 = 300$ ft. per min. The pressure required for the circulation is, therefore,

$$p = \frac{0.00000001 \times 24{,}000 \times 300^2}{36} = 0.6 \ lb. \ per \ sq.ft.$$

The corresponding units of work are, therefore,

$$u = 10{,}800 \times 0.6 = 6480 \ ft.\text{-}lb. \ per \ min.$$

Coal and Coke News

Washington, D. C.

The Federal Reserve Board has issued a new regulation relating to discountable paper which is already receiving widespread attention in all branches of business and is likely to be particularly useful in the financing of the coal industry, as business customs already existing there seem to be such as will permit the successful use of the trade acceptances without too serious obstacles.

In the new circular and regulation, provision is simply made for the direct rediscounting by Federal Reserve banks of paper drawn against sales of goods and accepted by purchasers. Such accepted bills are made eligible for discount or purchase by a Federal Reserve bank provided they bear the endorsement of a member bank. In issuing the new regulation, the board announces that it does so in the belief that the new policy will lead to the broadening of the use of two-name commercial paper by the country at large.

The trade acceptance is defined as a bill of exchange drawn to order, leaving a definite maturity and payable in dollars in the United States, the obligation to pay it having been accepted by an acknowledgement written or stamped and signed across the face of the instrument by the company, firm, corporation or person upon whom it is drawn; such agreement to be to the effect that the acceptor will pay at maturity according to its tenor such draft or bill without qualifying conditions.

A trade acceptance, to be eligible for rediscount under section 13 of the Federal Reserve Act, with a Federal Reserve Bank at the rate to be established for such acceptances must be endorsed by a bank which is a member of the Federal Reserve system, must have a maturity at the time of rediscount of not more than 90 days, and must be accepted by the purchaser of the goods who must certify that the indebtedness represented by the bill was expressly incurred in the purchase of goods.

The trade acceptance must bear on its face or be accompanied by, evidence in form satisfactory to the Federal Reserve Bank that it was drawn by the seller of goods on the purchaser of such goods. The evidence in question may consist of a certificate accompanying the acceptance in question to the effect that the obligation of the acceptor of the bill arises out of the purchase of goods from the drawer.

The new regulation, thus framed, is intended to afford more direct facilities to business men in obtaining credit through rediscount than are now available and will bring them into closer communication with the reserve banks.

PENNSYLVANIA

Anthracite

Hauto—In order to conserve a supply of water to keep the mines running during dry spells, which seem to come with great regularity during the past several years, the Lehigh Navigation Electric Co. has built an immense reservoir at a cost of $500,000. It has now been discovered that the reservoir has a leak so extensive that it is estimated it will entail an expenditure of $50,000 to render the storage plant entirely serviceable.

Centralia—While engaged in stripping operations over an old breast of the Lehigh Valley Coal Co., the ground caved in and four men employed by a contracting firm, were carried down into the mine. They all escaped serious injury except Michael Hausheck, who being caught beneath a mass of earth was smothered to death. His body was recovered several hours after the accident.

Girardville—Packer No. 5 colliery of the Lehigh Valley Coal Co. is shut down because the 600 employees have gone on a strike. Two men were discharged for disobedience of orders and the other workmen then threw down their tools.

Shenandoah—A series of accidents occurred in the mines here in one day recently in which 8 men were badly injured. The most seriously hurt was Charles Rotomosky. It is feared that he has been blinded for life.

Pottsville—W. R. McTurk & Co. recently sold all of the outside equipment, including buildings, at the Tomhicken mines, as it has been determined that the operation can no longer be profitably worked.

Tamaqua—Caught in an explosion in the No. 4 mine of the Lehigh Coal & Navigation Co. recently four men were so badly burned that they were removed to the Coaldale Hospital. Four others were severely burned, but had their injuries treated in their homes.

All the collieries of the Lehigh Coal & Navigation Co. in the Panther Creek Valley began operation in full on July 12, after a ten day lay-off. It is also reported that the business in sight is sufficient to warrant good working time for the remainder of the summer.

Bituminous

McClellandtown—The Puritan plant of the Puritan Coke Co. is making preparations to resume in full. The 84 idle ovens at the plant are to be fired. There are at this time 118 ovens in operation. The monthly production of the company is some 12,000 tons.

Gates—Orders have been issued by the Frick company to its officers at Gates, which has been idle for months, to prepare to resume in full forthwith. The output will be shipped direct to the Pittsburgh district. Superintendent Harry N. Boyd, of Lambert plant is to have charge of the operations at Gates.

Uniontown—Two hundred additional coke ovens have been ordered fired at the Frick plants contiguous to Uniontown. The list of plants affected includes Colonial No. 1. Continental No. 3; Edenborn; Hecla No. 3; Leisenring Nos. 1, 2 and 3; United; York Run, Hostetter and Whitney.

Five small coke plants near Brownsville have been ordered into full operation. The plants are: Garwood mines of the Etna Connellsville Co. at Simpson, shut down for over a year; Champion mines of the Connellsville Consolidated, near Brownsville; Grays Landing Connellsville Consolidated Nos. 1 and 2; Kathering works, Union Connellsville, at Simpson. At the five plants there will be something like 800 hitherto idle ovens fired. All the plants are owned by independent producers.

Pittsburgh—The properties of the Pittsburgh-Buffalo Co. were sold at public auction at Pittsburgh on July 15 to the Union Trust Co. of that city for $1,500,000, the only bid made. The sale was subject to a lein of a first mortgage made in 1909 to secure a bond issue of $2,500,000 of which bonds to the par value of $1,769,000 were issued and upon which there has been no interest paid since Aug. 2, 1913. The sale represents an outlay of nearly $3,500,000. The properties were exposed for sale in the rotunda of the Allegheny County court house under the direction of Attorney George H. Calvert the master named by the court. The holdings disposed of consist of the Marianna mine, the Francis mine, the Johnetta Mine, the Bertha mine and the Higbee tract. The first named is the largest containing about 5328 acres of coal. The mines are equipped with steel tipples and modern equipment. Included in the plant are 700 acres of surface upon which are erected the power plants, ovens, and houses of which 235 are built of brick. The properties were first offered for sale separately but there were no bids, after which they were offered in a lump. Attorney James H. Beal after the sale opened made the only bid of $1,500,000 as the representative of the Union Trust Co. There being no other bidders his offer was accepted. The Union Trust Co. holds the first mortgage on the property.

Brownsville—After a suspension of a year and a half the Garwood plant of the Etna Connellsville Coke Co. has resumed operations in full. There are 119 ovens at this plant and Superintendent C. L. Patterson is having a hard time in recruiting sufficient labor with which to fully man the plant.

Ferndale—Miners employed by the Smokeless Coal Co., in whose workings an explosion occurred May 24, have been equipped with electric lamps. These lamps, however, have been supplied the miners only in those sections where there is supposed to be gas.

WEST VIRGINIA

Charleston—All the coal mines operated on Kelley's Creek by the Sunday Creek Co. were recently closed, and will not resume operations before fall, if even then. Over 300 miners living at Cedar Grove have been thrown out of employment, while store clerks, teamsters and others are included among the number losing work. It is rumored that the Monarch Mine will also suspend operations for the summer.

ALABAMA

Birmingham—James L. Davidson, secretary of the Coal Operators Association is in Montgomery in the interest of pending legislation of interest to the operators. The two-weeks pay-day bill and the commissary check bill are measures before the body that are opposed by the coal operators. The Recess Investigating Committee has just made its recommendations, which urge, that the convicts be removed from the lease system and that they be taken from the coal mines and worked on the roads.

Edgewater—The Edgewater mines of the Tennessee Coal & Iron Co. are now working six days a week after being on short time for several months. The capacity of the mine is 2500 tons a day. About 300 people attended the annual outing and institute of the Alabama Coal Operators' Association at Edgewater. Lectures on scientific subjects dealing with mining and mine welfare work was a feature of the program. A demonstration was made of a dust explosion by black powder and the results from use of permissible explosives. Special papers on interesting subjects were read by experts.

KENTUCKY

Fleming—The Elkhorn Mining Corporation plant is now running full time in order to fill the large orders received within the past two weeks. It is expected that a record run will be made the remainder of the year.

Jenkins—The Consolidation Coal Co.'s plants here and at McRoberts are operating full time in their efforts to fill the big orders for their product received lately. More coal is now being shipped from the field around Jenkins than at any time in its history. Railroads are taxed to handle the tonnage.

OHIO

Bridgeport—The Loraine Coal & Dock Co. has decided to board up one of its largest mines until April of next year. This mine employed about 450 men when working to its full capacity. The Loraine Coal & Dock Co. is operating several other mines, but it is said the continuity of operation is precarious.

Pipe Creek—The Johnson Mine began work July 16, after being idle since April of 1914. For some time prior to the opening of this mine, men have been employed in getting things in proper condition to begin operations.

Steubenville—Fire almost totally destroyed the buildings of the Strabley Coal Co.'s mine recently, entailing a loss of approximately $10,000. The power house and the equipment contained therein and a part of the coal tipple were consumed. This mine employs about 70 men, who will be thrown out of work until the necessary buildings can be erected and repairs made.

Columbus—During the past week the Ohio public utilities commission has been securing information from local coal companies relative to alleged discrimination against Ohio in favor of West Virginia in the matter of coal rates. The decision of the Ohio Supreme Court, handed down recently, which confirms the right of the commission to adjust freight rates, is expected to bring about numerous requests for regulation from the coal shippers of the state. The Sunday Creek Co., declares that the complete suspension of its mines in Ohio for some time to come depends to a great extent upon the action of the commission. Unless the railroads decide to carry the question into the federal courts, the reduction of rate on commercial coal from the Nelsonville assembling yards in the Hocking Valley to Toledo, from $1 to 85c., will go into effect in the near future.

Nelsonville—A local strike which caused the closing down of two mines of the New York Coal Co. has been settled after a week's suspension. These mines are connected with the only active coal washery in the Hocking Valley, and the trouble was over the matter of hours for day labor.

Tropic—Making the assertion that the present mining scale, together with the Green mine run law has destroyed the coal industry in Ohio, the operators of the Tropic mine, have issued a circular showing that the payroll of the mine for June, 1915, was $457.05, as compared with $19,642.55 in 1913. As there was a general suspension in Ohio in the same month of 1914, that year offers no basis of comparison.

New Lexington—The collapse of the tipple at No. 1 San Toy mine a few days ago, shortly after the men had resumed work after a year's idleness, will necessitate further idleness until the damage can be repaired. This will take about a month.

Athens—Suit has been filed by Edgar Stark, as trustee under certain mortgages and deeds of trust executed by the Luhrig Coal Co., against that company for a receivership to take charge of the company's property pending the adjustment of claims based upon outstanding obligations. Leander D. Oliver, of Cincinnati, has been appointed receiver.

COLORADO

Denver—State coal mine inspector James Dalrymple, recently, revoked the certificate issued to Lindsey Connor, shotfirer in the Delagua mine of the Victor-American Fuel Co. after repeated warnings that his carelessness in firing was endangering the lives of miners. Dalrymple is striving to reduce the high mortality in Colorado coal mines which, in 1913, was 8.6 per 1000, and in 1914, was 7.0 per 1000. He states that conditions in Boulder and Weld counties especially have greatly improved.

PERSONALS

A. B. Lamb, state mine inspector, will be transferred from the 13th district at Shenandoah, to the 18th, with offices in Pottsville.

John Green, of Belleville, Ill., 74 years old, has passed an examination as coal mine examiner or fireboss. He is the oldest man who has ever taken the examination in Illinois. Green was formerly a member of the Legislature.

William T. Dunn, formerly tool-steel expert for the Carpenter Steel Co. in Boston and New England, has been appointed by the International High Speed Steel Co. of New York, district sales agent for New England and eastern Canada.

George L. Walkenshaw has resigned as superintendent of the Eastern Kentucky Coal Co.'s mines at Torchlight, Ky., and has been succeeded by R. C. Simpson. Grover Sea also has resigned as mine foreman and has been succeeded by A. B. Walkenshaw.

W. S. Robertson was appointed secretary of the American Locomotive Co. at a meeting of the board of directors recently held. This appointment fills the vacancy caused by the resignation of T. B. Denny, which was accepted at the same meeting.

I. W. Copelin, who for years was active in the coal trade of Toledo but who retired a couple of years ago, has brought suit against the Pennsylvania R.R. Co. for damages amounting to $10,000 which Mr. Copelin alleges he suffered during a collision at Woodville, just outside the city of Toledo a couple of years ago.

William Hamilton, 29 years of age, was buried for 45 min. under a fall of roof in Mine No. 2 of the Union Mining Co. on July 14. Hamilton was completely covered and the rescuing party were amazed when they reached him to find that he was not seriously hurt, his worst injury being a broken arm. Twelve carloads of soft roof coal were removed before the man was reached.

Ralph T. Coe, manager of the Canadian Sirocco Co. Ltd., Windsor, Ont., since the organization of the company, has resigned to enter the engineering service and sales field in New York State. Mr. Coe has been appointed district manager for Warren, Webster & Co. and the American Blower Co. and will have offices at 519 Insurance Bldg., Rochester, and 19 Live Stock Exchange Bldg., Buffalo, N. Y.

Stewart K. Smith, a mining engineer of St. Louis, has been appointed receiver of the Consolidated Indiana Coal Co., a corporation of the State of Maine, owning over 10,000 acres of coal rights and surface in Sullivan County, Indiana, with four operating mines; 6500 acres of undeveloped coal lands in Franklin County, Illinois, and 4500 acres of coal rights and surface in Marion and Lucas Counties, Iowa, with one operating mine. The receivership took effect on July 14.

White L. Moss, who has been vice-president and general manager of the Continental Coal Corporation, which owns the mines on Straight Creek, Ky., has resigned and Max Barker, of Louisville, chairman of the executive committee, has taken charge until the directors make permanent arrangements. The miners are still out on their demand for a 10 per cent. increase. In the same county the New Jellico Co. has given its men the 10 per cent. increase demanded. There are 600 miners still on strike in the county however.

Governor Dunne, of Illinois has appointed the following delegates to the 18th annual session of the American Mining Congress, to be held in San Francisco Sept. 20, 21 and 22: Frank Farrington, Springfield; J. H. Walker, Springfield; T. J. Reynolds, Collinsville; J. W. Starks, Georgetown; T. H.

Devlin, Assumption; W. T. Morris, Duquoin; James Lord, Farmington; J. F. Morris, Springfield; R. J. Wilson, Marissa; John Tuttle, Harrisburg; Walter Nesbit, Belleville; Thomas Clayton, Royalton; Thomas Kane, Harrisburg; Michael Fahy, Toluca; John F. Demlow, Danville; Barney Murphy, Pana; Joseph Pope, Belleville; Paul Smith, Marion; James Kellett, Gillespie; James Tyler, St. David; T. L. Jones, Ladd; David Ross, Springfield; John Bolander, Pekin; James Forester, Duquoin; Thomas Jeremiah, Willisville; Rice Miller, Hillsboro; A. J. Moorshead, East St. Louis; J. P. Reese, Gillespie; H. H. Devereaux, Springfield; Joseph Randall, Belleville; Julius G. Scott, Bloomington; Hugh Murray, Mt. Vernon; C. F. Lynch, Danville; Frank Peabody, T. J. O'Gara, Glen W. Traer, C. M. Moderwell, C. Robert Silsberg, C. W. Wardley and W. C. Niblank, all of Chicago.

OBITUARY

Robert Childs Scott, secretary and treasurer of the Morris Machine Works of Baldwinsville, N. Y., died recently.

The body of Capt. Bradey Williams, of Covington, Ky., pilot of the Monongahela River Consolidated Coal & Coke Co., steamer "Fulton," who was lost with the boat during a recent hurricane, has been recovered.

Adam S. Boyd, 55 years of age, division superintendent of the Philadelphia & Reading Coal & Iron Co., and in charge of the Shenandoah, Gilberton, Girardville and Ashland districts, and residing in Ashland, dropped dead on the evening of July 18 from heart failure after making an automobile trip from Ashland to Shenandoah. Mr. Boyd had risen from the ranks and at the time of his death was one of the best-known and most trusted coal men throughout his vicinity.

Frank A. Hill, president of Madeira, Hill & Co., extensive coal operators with general offices in Philadelphia, died in Pottsville, Penn., on the 13th inst. Mr. Hill, who was 56 years old, died of agina pectoris, superinduced by acute indigestion. He was an engineer of note, having begun his professional career with the Philadelphia & Reading Coal & Iron Co. Some time afterward he took charge of extensive bituminous properties in Virginia, returning to Pottsville in 1907, entering the firm of Madeira, Hill & Co. The work executed by him at Stanton colliery stands as a type of the highest grade of engineering skill in the anthracite region. In addition to having been a member of the Anthracite Geological Survey, he also took a prominent part in the affairs of the American Institute of Mining Engineers.

INDUSTRIAL NEWS

St. Louis, Mo.—Joseph P. Ryerson & Son, of Chicago, Ill., is making a considerable addition to the firm's St. Louis plant.

Pittsburgh, Penn.—It is reported that ore, coal, coke and miscellaneous industrial traffic is showing increases over the lines of the Pittsburgh & Lake Erie road to and from Lake ports.

Gary, Ind.—The American Sheet & Tin Plate Co. mills began operating to capacity on July 12. Fires were lighted in the remaining 70 coke ovens, and 10,000 tons of coal per day will be made into coke and the byproducts thereof.

Philadelphia, Penn.—Laden with coal, the power barge "Princess," bound from Baltimore to Pedrickton, N. J., sank recently in Oldman's Creek. The barge was later pumped out and floated and her cargo of bituminous coal salvaged.

Philadelphia, Penn.—Financial institutions of this city interested in the securities of the Continental Coal Co. have been placed on a committee for the protection of the holders of the first mortgage 5 per cent sinking fund bonds of the company.

Central City, Ky.—Coal traffic out of this section over both the Louisville & Nashville and the Louisville, Henderson & St. Louis is increasing and not a day passes when extra trains are not being made up. It is the belief in this section, though not confined by authoritative statements, that the coal is for the export trade.

St. Louis, Mo.—In a suit brought by the Big Muddy Coal & Iron Co. against the City of St. Louis and several individuals, to settle the question of title to a block of valuable land in Carondelet, pending in Judge Taylor's division of the Circuit Court, an order has been granted for the taking of depositions in Kentucky.

Moundsville, W. Va.—The James H. Leighty tract of coal land in Cameron and Webster districts was sold in front of the courthouse door by Auctioneer S. N. Cunningham, acting for Attorney Walter A. McGluphy, as trustee, recently for $18,000. This price is about $30 per acre. The purchasers were Messrs. Chaplin, Goldberg and Honecker.

Williamsburg, Ky.—Leading coal dealers from Ohio and Michigan formed a party which recently visited the operations of the Gatliff Coal Co. and the Mahan Jellico Co. at Gatliff and Packard, Ky., mines controlled by the Southern Coal & Coke Co., of Knoxville. E. C. Mahan, head of the Southern company's sales department, was host to the party.

Harrisburgh, Penn.—Arrangements were made recently by Auditor-General Powell and representatives of the Philadelphia & Reading Coal & Iron Co., and other anthracite producers for the filing of the monthly reports of production under the new state hard-coal tax. For the present a few days allowance will be given after the 15th of the month for the filing of the reports, but later on the 15th will be adhered to.

Toledo, Ohio—August is the month chosen for the annual picnic of Toledo coal dealers. It has been determined once more to hold the affair at Sugar Island in conjunction with the Detroit dealers as was done last season. A meeting was held in this city recently at which time it was decided to hold the joint picnic. Committees have been appointed to secure prizes and arrange for the athletic sports and general entertainment which is a feature of this affair.

Mahoney City, Penn.—Crossing the street after having called on a neighbor at Trenton, Penn., recently, Mrs. Andrew Matruck, accompanied by an infant, was engulfed in a mine cave 30 to 40 ft. deep when the roadway suddenly caved in beneath her. With rare presence of mind the woman tossed her child to safety, but received serious injuries herself. The cave-in was due to the weakening of the roof of the Park Place mine, over which the entire village of Trenton is built.

Williamson, W. Va.—The month of June, 1915, established the largest month's coal tonnage for the Norfolk & Western R.R. in the history of the road, exceeding the previous record by over 170,000 tons. In September, 1914, 2,509,916 tons were handled, but in June of the present year 2,680,465 tons were hauled. In 1914, the banner year of the road, it handled 25,471,969 tons of coal. The outlook now is that during the last half of 1915 the output will increase from month to month and establish by a large margin a new high record.

Chattanooga, Tenn.—Nine of the Chattanooga Gas & Coal Products Co. by-product coke ovens are now operative at Alton Park. These are being run on their own gas now, after having been heated for nearly a month with gas from the Chattanooga Gas Co.'s plant in the city. Twelve tons of coke a day are being made in each oven and when the plant is in full operation coke will be produced at the rate of 400 tons daily. This is the first plant to use the new Roberts ovens and is to be visited by a large party of iron steel and coal products manufacturers.

Uniontown, Penn.—The sale of 72.08 acres of coal by the receivers of J. V. Thompson has been confirmed by the Fayette County, Penn., courts on petition of the receivers. For the sale of coal in South Union Township to the trustees of the estate of the late W. J. Rainey the receivers of Mr. Thompson will receive $129,733, or about $1665 per acre. There is a mortgage against the tract held by the Citizens Title & Trust Co. of Uniontown for $110,000. The bank will receive all of the purchase money in satisfaction of the mortgage and interest with the exception of $15,000 cash which will go to the receivers.

Cincinnati, Ohio—The sale of the Marmet Coal Co.'s properties to the New York syndicate formed to organize the Kanawha Splint Coal Co., with a capital stock of $20,000,000, to take over the Marmet and other properties, has fallen through for the time being, owing to the failure of the purchasers to make the initial payment. The amount settled upon as the purchase price of the Marmet properties was $1,500,000, and it was agreed that 25 per cent. of this should be paid at once, but this was not done. The property may therefore be offered for sale again, bids to be received up to Sept. 21, but it is believed that the New York concern will by that time be able to complete the deal.

Pittsburgh, Penn.—A bill in equity was filed July 15 in Common Pleas Court by the Harris Pump & Supply Co. against the Meadowlands Coal Co. in which the apointment of a receiver was asked for. James S. Boggs was named by the court as a temporary receiver. The plaintiff has claims amounting to $1152.28 against the company which it has been unable to meet. It is alleged that the statement of the company on July 1 showed that its liabilities amounted to $725,860.25, while the assets consist of valuable coal lands and equipment. It is alleged that owing to the depression in business the coal company had been unable to operate its mines to full capacity, with the result that income had been curtailed making it difficult to meet outstanding obligations.

Philadelphia, Penn.—The Custom House in its report for the fiscal year ending June 30, 1915, shows that during the year there was exported 2,133,081 tons of bituminous coal, which is 56,155 tons less than last year. The decrease in tonnage for the year is due to the fact that at the beginning of the war in Europe last August practically all tidewater shipments ceased, including the coaling of vessels with bunker coal. However, within the past two months the export tonnage has been mounting rapidly. This fact is borne out by the June statement of idle cars issued by the American Railway Association, which shows the number of cars standing July 1 as 83,541, compared with 105,779 for the month previous, and of this total decrease of 24,817 idle cars, 22,238 were coal cars.

Philadelphia, Penn.—Shipments of bituminous coal to the countries of South America are on the increase, and it is altogether likely that this business will be a permanent feature of the American trade, even after the war. There is not a doubt of the ability of American coal to compete with fuel from any part of the world. The shipments to Brazil in particular have increased at a rapid rate. Formerly less than 10,000 tons per annum were exported there, but for this month alone almost 20,000 tons have been shipped, five vessels having left within the last few days with 19,000 tons in their holds. The bulk of the coal for Brazil has heretofore been shipped from Southern ports, but an adjustment in the freight rate has brought a large portion of the business to this port.

Denver, Colo.—One month age, the state public utilities commission put into effect a new schedule of freight tariffs on Colorado railroads with special application to the coal-hauling roads. These rates are considered fair by retailers, shippers and consumers in that they take account of distances hauled while equalizing the opportunities for large and small producers. The Colorado & Southern Ry. now comes forward with a petition for a reopening of the hearings in the matter, making special plea for readjustment of its freight rate on the long haul to Denver from the South Canon coal mine. Decision on this petition has not been made but it is not likely that any concession will be granted for the reason that such an act would become a precedent for the filing of numerous other similar complaints.

St. Louis, Mo.—The St. Louis Coal Club met recently at the American Annex and devoted the entire evening to a discussion of the city scale law. There was an attendance of about 100, with all branches of the trade represented. The sentiment was unanimous that the law is oppressive and accomplishes no good and ought to be wiped out or substantially modified. President Beddoe was authorized to appoint a committee to organize a campaign for the repeal of the law. He named Fred Kleine, W. H. Boehmer and W. H. Riester. A bill will be submitted to the Board of Aldermen in the fall, providing for the repeal of the present law, which requires coal men to pay 3c. for each load of coal that is weighed. The argument against the law is that the weighman's bond does not protect the dealer, who has to pay for the weighman's mistakes. Ten of the largest cities in the country, it is said, are not using city weigh tickets. A great many of the steam users in St. Louis have their own scales and payment is made on their weight, but the dealer has to pay for the city weigh tickets anyway. The law is said to cost the St. Louis dealers about $30,000 a year.

Frankfort, Ky.—Opposition to a proposed increase in the freight rate on coal from West Virginia points to central Kentucky over the Chesapeake & Ohio and the Louisville & Nashville railroads was brought out at a hearing held here on July 15 by Examiner H. E. Kelly, of the Interstate Commerce Commission. The Louisville & Nashville objects to the rate of $1.10, ordered by the commission several months ago suspending an advance; alleges that it gets $1.20 for a shorter haul from the eastern Kentucky coal field along its own lines and represents that participation by it in a rate of 10c. less from the West Virginia field discriminates against its own territory. The Cabin Creek Coal Co., the Carbon Fuel Co. and the Clear Creek Coal Co. of West Virginia, originated the complaint, and the Chesapeake & Ohio, some of the distillers and local dealers in Frankfort were represented, while other central Kentucky towns displayed much interest. The disadvantages resulting from the situation are illustrated by the fact that the state officials were unable to consider bids of the Clear Creek Co. and other West Virginia firms were not considered in letting contracts for certain state institutions because they were unable to guarantee a price, which must be dependent on rate changes. The West Virginia operators claim that the increase would bar them from a good market, while the Louisville & Nashville contends it is necessary to protect the Kentucky fields. The controversy is a phase of that which has been pending for a long time and the case may get to the higher courts before it is settled finally.

Coal Trade Reviews

General Review

Record breaking dullness prevails in anthracite. Indications of a further slowing up in bituminous also. The rapid expansion in export business continues. Middle Western markets well maintained in spite of the unusual heaviness.

The paucity of anthracite orders is evident in all directions. Conservative members of the trade agree that the summer dullness has scarcely ever witnessed such a combination of extremely low prices and light tonnage. Predictions as to the future are more uncertain. In view of the heavy stocks that are accumulating, the selling agencies are less confident of the anticipated rush for coal this fall, although labor difficulties may complicate the situation later. A slowing up in Lake shippings is throwing some additonal tonnage back on the producers, but if the fall movement out from the upper ports is of normal proportions the anthracite Lake movement will be about average.

General dullness still characterizes the bituminous situation in spite of occasional isolated reports of an improvement. The release of large tonnages of high grade coals, that have heretofore been held exclusively for export business, is significant evidence of the trend of conditions. A tremendous movement out of Hampton Roads, reaching to such proportions that the railroads are being crowded for a more rapid dispatch, is creating a distinctly optimistic tone at that point, but this business is restricted to only a few companies specializing in that trade and is not of sufficient proportions to affect the general market.

The salient feature of the Eastern bituminous situation is a light demand on contracts and surpluses at all points. Buyers are again showing indifference, and while there is still much conservatism among agencies regarding future business, concessions are offered to induce prompt buying.

With the steel industry in the Pittsburgh district operating at approximately full capacity, and the railroad and industrial demand slightly better, there is a moderately improved tone to the situation. There is obviously more coal going into consumption, while the export demand has proved a potent factor in relieving the pressure to a certain extent, but on the other hand the Lake movement is falling rapidly behind even the extremely low figures of last month, while prices are generally irregular with contracts being negotiated at still further concessions.

Buyers in Ohio feel confident of being able to purchase their requirements in the prompt market. The situation is also very unsettled and disturbed by various labor, legislative and freight rate difficulties. Market conditions are generally unsatisfactory, with the West Virginia companies absorbing most of the business that develops. The extremely light Lake movement is a particularly unfavorable factor in the situation. Heavy rains are delaying the crop movement to the South, but cotton operations are getting slowly under way, and are beginning to absorb some coal.

An unusual quietness prevails throughout the Middle Western markets, but the operators are meeting the situation by rigidly curtailing outputs down to well within the absorptive power of the trade, so that the situation is well in hand. Conditions toward the Northwest are somewhat brighter. The threshing and school demand are absorbing a larger volume of coal as the season advances and the time for price increases approaches.

A Year Ago—Anthracite rounds out the month in better form than anticipated. Eastern bituminous market at the lowest point for a long time. Situations at interior points picking up under the influence of the large crops and the long suspension in Ohio.

BUSINESS OPINIONS

Iron Age—The steel trade continues to gain ground, with enough lag at certain points in the industry to keep the advance from proceeding too rapidly. The feeling crops out here and there that prices on export business apart from war requirements may be put up too fast. The Steel Corporation's operations are now at about 91% of its ingot capacity, while the Carnegie Steel Company is employing close to 95% of such capacity. At Chicago the larger operations of the principal plants have been due to the transfer of orders that would naturally be rolled at Pittsburgh.

Am. Wool and Cotton Reporter—The Boston wool market is still displaying great firmness, but has possibly been a trifle quieter on account of the prospective opening up of the new fleeces and territory wools, which are rapidly coming in. The West is becoming absolutely cleaned up of the new clip at prevailing prices. At the London sales the best merinos brought 82 cents clean. Australian cable advices are strong. The cotton goods market is in a moderately quiet condition. The total sales have been somewhat larger than a week ago, but the goods were more spot or early delivery than previously.

Boston News Bureau—If any one doubts the genuineness of the current revival in business and trade he has only to examine the news of the day to be confounded. Everything nearly is on the constructive side of affairs from crop reports and railroads' gross and steel earnings to war orders. All doubt as to the breadth of improvement in the steel and iron industry, which was pretty well dispelled by the last tonnage statement of the Steel Corporation, must be removed by the six months' statement of the biggest independent, Republic Iron. The noteworthy fact that this strong showing is based solely on domestic business makes pertinent the idea so frequently expressed by trade authorities that the revival in the country's basic industry is in no sense a "war-order" movement.

Marshall Field & Co.—Current wholesale distribution of dry goods has maintained about the same volume as during the corresponding week a year ago. The attendance of merchants in the market has been large, indicating a lively interest in merchandise for warm weather retailing.

Dun's—Constructive factors accumulate and the international uncertainties, while making for caution, fail to check the growth of confidence in the future. With the basic influences still gaining in strength, the outlook steadily becomes brighter. It is mainly in sentiment that the general situation continues to reflect uniform and substantial betterment, but in actual commercial transactions there is also concrete evidence of improvement.

Bradstreet's—Factors making for expansion multiply. Evidence is provided by such facts as considerable improvement in industrial matters, virtually full movements in finished steel, overtime work in numerous war-order lines, smart activity at shipyards, freer distribution of seasonable goods, bounteous yields of foodstuffs, better collections, growing scarcity of labor, slightly larger sales of steam coal, absence of strain in money matters at the crop-moving season, increased construction of plants to take care of war orders, and some Western agricultural implement makers resuming operations, whereas a while ago it seemed as though work would not be started before September.

Southern Lumberman—Enlarged activity in general industrial lines, is having its effect on the hardwood market in sustaining it through the unusually dull summer period. While trade is not as active as could be desired, it is nevertheless steady. The settlement of the carpenters' strike at Chicago has injected much optimism into the yellow-pine market.

ATLANTIC SEABOARD

BOSTON

Pocahontas and New River market sags again and buyers are encouraged to wait.. Improvement not expected until September. Off-shore market has much influence on the situation. Surplus stocks in New England. Pennsylvania shippers again seeking orders. Anthracite orders scarce.

Bituminous—There has been another slackening in the Pocahontas and New River market the past week, with coal again more plentiful than orders at the loading ports. Among some of the shippers there have been small recessions in price in order to induce spot business but as usual with small result. New England buyers who have so far remained out of the market have resumed their stand-off attitude and it looks as if there would be at least one more noticeable sag their way before there is any pronounced improvement. There is just as much conservatism with regard to options for fall deliveries but for August business the prophets have turned out to be rather previous in their predictions of firmer prices.

The off-shore market is rather erratic. Steamers are somewhat easier to get, however, and a satisfactory export business is looked for in September.

That the export trade has slackened is apparent in the case of Georges Creek. Shippers of this grade have been well supplied with foreign orders all the season, most of the time to the exclusion of coastwise calls, but now there is a plentiful supply at tidewater and clearances for New England have almost resumed their former standing.

Where some of the quality grades from Pennsylvania were declining orders a fortnight ago they are again trying to secure spot business. Production has been well up to capacity and the West Virginia coals are still actively in the market at prices considerably lower than $2.85. While this continues the Pennsylvania grades will necessarily be somewhat hampered in placing any comprehensive volume of coal until conditions improve.

Water Freights show no pronounced change, although rates are hardly as firm. Seekers for tonnage find themselves obliged to pay the full rate, while owners with tonnage on their hands find it hard to place spot boats except at concessions. The approach of the hurricane season is expected to cause some sail tonnage to withdraw temporarily from the off-shore trade. The rate on bituminous in anthracite-carrying barges, Philadelphia to Boston, shows no sign of being reduced, it now being 5c. higher than a year ago.

Anthracite—The scarcity of orders is now plainly felt. Production is being held down, however, pretty closely to current needs and this adjustment will be likely to continue until the fall demand sets in.

Current prices on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.40@2.85	2.92@3.02	
New York*	2.40@2.95	2.70@3.15	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.65@2.75
Boston†				3.55@3.68
Providence†				3.45@3.68

* F.o.b. †On cars.

BALTIMORE

Exports hold up well and month will probably show movement of over 200,000 tons. A better inquiry is developing, but coal is still offering very cheap.

Prices remain unsatisfactory despite an increasing call on contracts. Spot coals of all kinds except the very best grades are offering dangerously close to or below the cost of production. Low grade coals of Pennsylvania are commanding about 90 to 95c. to the trade at the mines, while Maryland and West Virginia coals of the less desirable kinds can be had as low as 75c. Slack is in a little better call and fairly strong at about 50c.

In a big equipment order this week, reaching a total value of $2,500,000, the Baltimore & Ohio R.R. included 2000 steel hopper cars. This road is planning to meet a collossal coal trade that all are looking forward to when business gets down to a more normal basis.

The export coal trade continues excellent. Prospects are now for shipments considerably in excess of 200,000 tons for July. This coal is going to European, African and South American ports. Last week a total of nearly 58,000 tons of cargo coal was loaded and 23,000 tons of bunker coal. Foreign vessels are bunkering more and more in Baltimore, instead of stopping at Newport News, as in the past. That new bunker contracts will be made here seems assured.

NEW YORK

Soft coal operators are following the British strike closely and some are preparing to ship. Many Italians leaving Southern fields. Anthracite trade quiet. Union officials preparing for labor trouble. Individual coals selling off.

Bituminous—The chief topic of interest among the soft coal operators and shippers is the Welsh labor situation. There are a number of dealers who believe that American shippers will have an opportunity to dispose of much of their coal to English buyers. Some local coal men are so strong in this belief that they are already making inquiries regarding bottoms. Many new inquiries for coal for export are being received from France, Italy and Spain.

There is still more than enough coal on hand to supply all needs. Many loaded vessels are tied up with no buyers in sight. Labor is getting scarce in the West Virginia and Fairmont regions it being estimated that at least 5000 Italians have departed from these sections for their native land. With the market in its present condition their absence is not particularly felt. Contracts are enabling many of the mines producing the better grades to work a little better than half time.

Local conditions do not show much change. Demand continues slow. Spot business is practically dead. Prices remain stationary. Quick buyers are able to pick up some good bargains. New York shippers are watching with much interest the labor situation in Bridgeport, fearing that should operations cease it will result in the loss of considerable business to them.

The better grades of Pennsylvania coals were quoted around $2.60 and Western Maryland at about $2.35. Current quotations are on the following basis:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.30@3.40	$3.30@3.40	$3.30@3.40	$1.75@1.85
Georges Creek Tyson	2.90@3.00	2.90@3.00		1.35@1.45

Western Maryland		2.35@2.40	2.35@2.40	.80@ .85

Anthracite—While strenuous efforts are being made to sell anthracite coal, the situation continues dull. In addition to the piers being over-stocked the harbor contains many loaded bottoms. The only bright spot is in the small steam sizes. Restriction in mining has affected these coals and there is a note of strength. Large consumers are making inquiries. The better grades are getting scarce, due to the less than half time operations.

The labor situation is also taking some attention from the operators. At the same time the mine owners are being brought face to face with the efforts of the Mine Workers Union to strengthen their organization before the expiration of the working agreement on Mar. 31. Daily meetings are being held throughout the mining regions which are being attended by the international officers of the organization.

Chestnut is long size of the prepared coals. Stove is the most active with egg a good second. Individual prepared coals are being quoted at from 40 to 50c. off the companies' circular. Considerable pea is being stocked. On the buckwheat coals quotations are noted at from $1.40 for No. 3 to $3 for No. 1.

Current quotations follow:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.85		$4.90	
Egg	5.10	$4.70@5.10	5.15	$4.75@5.15
Stove	5.10	4.70@5.10	5.15	4.75@5.15
Chestnut	5.35	5.00@5.35	5.40	5.05@5.40
Pea	3.35@3.50	2.70@2.95	3.40@3.55	2.75@3.00
Buckwheat	2.50@2.75	2.00@2.25	2.55@2.80	2.05@2.30
Rice	2.00@2.25	1.70@1.85	2.05@2.30	1.75@1.90
Barley	1.75@2.00	1.45@1.70	1.80@2.05	1.50@1.75

PHILADELPHIA

Anthracite continues very dull, with prices well off circular. Only strength lies in egg and stove, with chestnut difficult to move, and pea sold at extremely low prices. Bituminous shows no improvement locally, but tide shipments continue to hold up.

Anthracite—All agencies agree that they are not doing half the business now that they did the same time last year. One of the oldest men connected with the trade states his company has never before witnessed such conditions—extremely low prices coupled with the extraordinarily light tonnage. However, all dealers report they are receiving good orders for fall delivery.

Chestnut continues the worst size; with the storage yards filled and no market it is becoming quite a serious proposition and individual operators are taking any price. April circular for this size is common and it is known that some business has been taken at 10c. less. Egg and stove sizes are probably in better demand than the other grades, and some of the shippers claim they have good business on these sizes for shipment to the New England market. There was a report here, however, that egg was being offered in 500-ton lots at $3 10.

Pea coal continues on its erratic career. Big buyers of this size who only a few months ago gladly paid $2.25 plus the tax will not consider $2 flat now. One large dealer reports that he is buying plentifully of this size at less than $1.50, and if such is the case it is more than likely it is coal that has been protected as to price by a producer to cover fuel intended for the schools, the contract for which was recently awarded at an extremely low figure. There is no doubt that there is plenty of pea to be had at $1.50, as one colliery owner is offering this size direct at that figure.

A sales agent of one of the largest companies has instructed his force to devote the next two weeks to collecting accounts, though this is even more difficult than selling coal at this time; in fact some shippers are emphasizing their offer of long time credits. This is being featured with desirable business more than ever and even those dealers who have had the reputation of being notoriously slow pay are finding no difficulty in stocking up.

It is now becoming difficult to predict what the market will be since the unprecedented stagnation this summer will likely leave its effect. It hardly seems probable that the large storage tonnage can be absorbed even in the face of a possible strike. On the other hand there may be a stringency of coal to meet the orders when the cold weather comes, due to the fact that the steel mills in this vicinity are offering wages that are attracting labor to such an extent that when fall demand opens up it is likely to be serious.

The circular prices, to which the state tax of 2½% must be added, are as follows:

	City	Tide		City	Tide
Broken	$3.20	$4.45	Pea	$2.50	$3.25
Egg	3.45	4.70	Buckwheat	1.25	2.25
Stove	3.70	4.70	Rice	.85	1.75
Chestnut	3.85	4.95	Barley	.50	1.50

Bituminous—The trade is extremely inactive and does not seem to have recovered from the slowing down over the Fourth of July. The working time at the mines has been very much reduced accordingly. Export business is a specialty with certain companies, and whether times are brisk or dull the other concerns rarely touch it. Those companies particularly interested in the export business continue to report a good volume of trade, especially to South American countries, and Brazil in particular lately. One difficulty has been lately to secure carriers, which has of course made the rate high. With the exception of tide shipments the trade does not look for any marked improvement for a month or six weeks, and in the meantime prices continue very low, but with no likelihood that any further reductions will be made.

The ruling prices are about as follows:

Georges Creek Big Vein	$1.65@1.75	Fairmont gas, mine-run	$1.15@1.25
South Fork Miller Vein	1.50@1.60	Fairmont gas, slack	.65@ .75
Clearfield (ordinary)	1.00@1.20	Fairmont lump, ordinary	.85@ .95
Somerset (ordinary)	1.00@1.15	Fairmont mine-run	.75@ .80
West Va. Freeport	.85@ .95	Fairmont slack	.45@ .55

HAMPTON ROADS

Large shipments both foreign and coastwise. Prices firm. Indications bright for heavy movement during balance of month.

The dumpings over all piers during the week have been very heavy especially as regards export movement. Italy still receives the bulk of the export shipments although some fair sized cargoes have gone to South America ports. The demand is heavy for New River and Pocahontas run-of-mine. Some shipments of nut and slack have also been made but the demand for these as well as the high volatiles is not heavy.

English mine conditions have not as yet, so far as can be seen, caused any additional inquiries and unless the strike continues for some time it is not believed that prices at Hampton Roads will be affected.

There is little free coal at Hampton Roads at this time as practically all shippers are rushed with orders and are dumping the coal into vessels as fast as it arrives from the mines. The railroads are rushing coal forward with all possible speed and are doing everything possible to get vessels loaded as promptly as possible. There have been times during the past week when some of the larger shippers had vessels in port for over 50,000 tons of cargo with less than one-fourth of the coal on hand.

With the amount of coal already dumped and the vessel tonnage declared, the expectations are that the total tonnage for the month of July will be a million and a half or over.

Railroad Tonnages—Dumpings over the local piers for the past several weeks compare as follows:

	Week Ending				
Railroad	June 19	June 26	July 3	July 10	July 17
Norfolk & Western	207,824	213,279	211,017	174,822	180,090

LAKE MARKETS

PITTSBURGH

Better manufacturing demand but poorer Lake shipments, leaving mining operations at about 50%. Increased export demand expected for Connellsville. A new byproduct plant.

The industries are taking somewhat more coal, almost wholly by way of heavier specifications on contracts. The steel industry is now operating almost at its capacity, and coal consumption in that quarter is about as great as can be expected. Railroad requirements show a slight improvement. Lake shipments are decidedly less than in June, though it is not unusual for July to show some decrease. Altogether the Pittsburgh district is experiencing scarcely any better demand for coal than in the past two months, and mine operations only average about 50% of capacity. An increased demand for export coal is expected should the Welsh mines be tied up for long but this will affect the Connellsville region chiefly and will hardly reach the Pittsburgh district.

Pickands, Mather & Co., Cleveland, have joined with the United Steel Co., Canton, Ohio, to put up a blast furnace and byproduct coking plant at the latter point, and Pickands, Mather & Co. will probably furnish the coal for the plant through some of their various connections. Prices for free coal are as irregular as ever. The general basis remains quotable about as follows: Slack, 45@50c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. Even contracts to Apr. 1 could be made at substantially these figures, except of course in the case of slack.

BUFFALO

The improvement in iron creates a better feeling. Volume of bituminous larger. Anthracite still moving slow.

Bituminous—While there are some who still report no improvement they are now in the minority. There is more coal going into consumption and the export demand is growing at a good rate. This market does not profit directly by ocean shipments, but they lessen competition. All reports from the iron trade are good. Ore coming down the Lakes is in large volume and it is going out from the lower docks even faster than it is received.

If the Canadian trade would pick up a little there would be a most hopeful outlook, but it does not look as if there would be much in that trade right away. Should the war stop before long, there ought to be a general upturn of all sorts of business, both here and in Canada. Buffalo sells so much coal across the border that the dropping off there is a serious matter.

Bituminous prices are stronger except slack, which has received a hard blow from the refusal of operators to stock any this summer. It often goes at a very low price, though the best salesmen refuse to accept it. Quotations remain on the basis of $2.70 for best Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.15 for slack, with sizes much stronger than slack.

Anthracite—The demand is so light that the trade is practically at a standstill, as compared with the average summer. However there is never anything like a large warm weather trade in this section, unless there is some sort of a scare on, such as was the case last August, when it was thought the Canadian trade might be shut off. It is believed now that the demand will be all the better late in the season on account of the general slowness now.

Shipments by Lake have fallen off but this is not expected to last. There are reports that stocks are getting too large at the upper port, but the shippers as a rule say that they have room enough yet and with a fair amount of fall buying the big Lake movement of anthracite can be kept up all the summer and fall. There is only a small local trade. Shipments by lake for the week were 105,600 tons.

CINCINNATI

Sluggishness continues in all departments, with virtually no market. However, short stocks will probably force purchasers into the market soon.

Retail dealers everywhere seem to be entirely confident of their ability to secure coal at low prices, and they are still justified in that belief by the continued sacrifices which are being made. Prices which necessarily mean a loss to the mine have been common lately, although a number of high-class concerns are holding firmly for profitable figures. Smokeless seems to be in its usual strong position, reinforced, as always, by the relatively limited supply. Splint and gas are in extremely poor demand, with no definite prospects.

CLEVELAND

Coal receipts too small to fill the demand for the first time in months. Lack of orders for prepared sizes is the cause. Coarse coal remains unchanged and the Lake trade is very light.

When the week opened only 175 cars of new coal were on track. This is about half as much as has been coming in over Sunday the last few weeks and a third of a normal Monday morning stock. Fine coal was up five cents and went to contract customers almost entirely. Large consumers called upon their dealers for more fine coal and received sufficient to take care of their immediate needs, but could furnish nothing beyond that.

So light are the three-quarter Lake shipments that fine coal is limited; this will result in hand-fired boilers using mine-run or three-quarter. There is no improvement in sight for the Lake trade and consequently there will be no increase in slack. The supply of slack has been decreasing for about two weeks and is not likely to be larger for two weeks more. Jobbers are predicting $1.75 to $1.80 for this grade by Aug. 1.

Pocahontas and other smokeless fuel operators in the southern field are refusing orders for lump and egg at current prices. They will accept all the orders they can get for mine-run at the circular or a shade under, but will not name a figure on lump and egg to anyone except old customers.

Retail dealers are not taking much coal and are not expecting to until nearer fall. It is likely there will be about six weeks of a rush in the Ohio and western Pennsylvania fields this fall. The Upper Lake docks will move coal to interior points in large quantities during the grain season, Oct. 1 to Dec. 1, and the retail demand will be large about the same time. This is the only bright spot in the future now.

Quotations for shipment are:

TOLEDO

Prices stronger and movement a little better. Lake movement fair. Operators holding back production.

A better tone is noted in the local market. Prices are stronger and there is a little more buying. The threshing season is now at its height with a big crop to harvest and this has helped out the situation to some extent. The Lake movement is strengthened somewhat and it is expected that dealers will soon begin their regular fall stocking. Steam coal is quiet and improvement is anticipated shortly.

West Virginia coal still seems to have the inside track, especially in the Lake business. Kentucky coal has also experienced a fair movement at good prices. Hocking, Pomeroy and practically all the Ohio grades are slow and not very firm as to price, but there is a marked tendency on the part of operators to shut off the production rather than make large concessions. Smokeless demand continues fairly firm but there is practically none of the better grades being offered; there has been no change in prices but they are beginning to hold closer to the list.

COLUMBUS

Dealers buying more freely but the situation continues dull. Lake trade has amounted to scarcely anything and West Virginia producers are even aggressively competing for local business.

Dealers are beginning to give more earnest attention to next season's stocks, and there is a fair run of orders for July and August delivery. Few shippers are giving any guarantee in prices beyond Sept. 1. It is believed that dealers' stocks will be found short of normal when fall sets in, by reason of tardy buying during the summer, and that this will cause a material advance over present quotations.

The general state of the trade is bad. A number of operators have taken the position that the mining rate is prohibitive under prevailing industrial conditions, and will allow mines to remain idle until prospects brighten. Operators are slower than for many seasons past, except when strikes have existed. Ohio markets are being largely taken over by aggressive West Virginia competition, which has the benefit of a much lower mining rate.

Lake trade from the Hocking Valley will be practically nil this season. The largest producing company, which for several years past has averaged over 1,000,000 tons to the Northwest docks, has not shipped a single cargo, and nearly all of its mines are down. The Pomeroy district has shipped about 35,000 tons to the Lakes so far this season, which is about half of the tonnage for which it holds orders.

There is little indication of any marked revival in the steam trade. Mine-run and screenings remain at the low prices which have prevailed for some time. Consumers are depending largely on the open market. A generally hopeful view is taken of fall and winter.

Prices in Ohio fields are as follows:

	Hocking	Pomeroy	Kanawha
Rescreened lump	$1.50	$1.55	.....
Inch and a quarter	1.35	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine run	1.10	1.10	1.05
Nut, pea and slack	.70	.75	.65
Coarse slack	.60	.70	.55

Mines have been working at about the following percentages of full capacity.

District	Week Ended June 26	July 3	July 10	July 17
Hocking	25	25	20	25
Jackson	20	25	15	25
Pomeroy	45	30	45	40
Crooksville	25	55	30	20

District	Week Ended June 26	July 3	July 10	Juiy 17
Cambridge	30	20	25	35
Masillon	30	15	25	30
Eastern O.	50	40	60	50
Average	32	30	31	32

LOUISVILLE, KY.

Beginning of cotton movement and improvement in general conditions creating a better tone.

The domestic stocking demand is slow appearing, especially in the interior. The almost constant rains are delaying threshing and perhaps damaging the grain. Cotton gins and cotton seed mills are soon to start in the South and a demand is beginning to develop in that section. Some steel plants are calling for Kentucky coal, but generally industrial conditions are still backward.

Prices quoted range all the way from $1.25 to $1.90 on block, and from 25 to 40 and 40 to 60c. on nut and slack, although as a matter of fact operators are selling, to a considerable extent, for what they can get. Nut and slack in the western Kentucky field is more plentiful than for a long time.

COKE

CONNELLSVILLE

Much stronger feeling, due to improvement in iron and steel markets. Appraisement of J. V. Thompson's properties. Holiday decreases production and shipments.

There has occurred a very decided stiffening in the views of coke operators as to the price furnace coke should bring, and while no sales at advanced prices have been made the whole tone of the market is clearly stronger, being helped by the further and more marked improvement in the steel industry and by the greater activity in pig iron, which has led to slightly higher prices in Bessemer and basic grades, though not in foundry iron. There are two or three inquiries out for furnace coke for delivery over various periods. The market seems to stand about as follows: Prompt furnace, $1.60; July and third quarter, $1.75; second half, $2; prompt foundry, $2@2.50; contract foundry, $2.20@2.50, per net ton at ovens.

The appraisement of the properties of Josiah V. Thompson, Uniontown, who went into receivers' hands last January, has been filed in court, showing a total value of $65,367,758. Included in the coal holdings are 58,404 acres in Greene County.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended July 10 at 340,742 tons, a decrease of 30,672 tons, and shipments at 330,073 tons, a decrease of 46,884 tons. The decreases were due to celebration of the national holiday.

Buffalo—There is much report of a stir in coke, consequent on the better state of the iron trade and this is expected to last. Some of the dealers report that they have sold a few cars at a slight advance. The larger concerns, though, generally refuse to acknowledge the advance, but say that it will come if the better demand continues. Iron ore by Lake follows the increase in the coke movement and the entire feeling is much better than it has been in a long time. Quotations are strong on the basis of $4.15 for best 72-hr. Connellsville foundry, with stock coke $3.20.

Chicago—Domestic sizes of byproduct coke are flat, and it is easy to obtain a concession of 15c. per ton from circular prices on immediate sales. Furnace and foundry sizes seem to be stronger, and the wholesalers predict higher prices shortly. Prices are as follows: Byproduct, $4.65@5.10; Connellsville, $4.75@5; Wise County, $4.75; gas coke, $3.75@4.90, furnace, $4.75.

MIDDLE WESTERN

GENERAL REVIEW

General outlook encouraging with demand quiet but prices held reasonably firm. Screenings steady. Anthracite moving slowly.

The market has been unusually quiet during the past week, and the rush of orders at the close of June seems to have been followed by calm. Shippers appear to have anticipated this situation, and production is being closely held down to the market requirements. A slight increase in domestic buying has been noticed at the higher prices.

There is little consignment coal on track in Chicago and prices on all sizes have been well maintained; in fact the market is showing such strength that as soon as there is a normal demand it will likely result in another advance in prices. Domestic consumers still show no anxiety to stock up. Retail dealers bought a small additional tonnage at the lower prices prevailing at the close of last month, they have not since made efforts to increase their commitments. The downward trend of screenings seems to have been checked, and prices on fine coal are steady.

CHICAGO

Demand generally quiet except on screenings. West Virginia grades in generally good demand. No consignment coal noted. Anthracite moving slowly but a strong demand anticipated later.

The demand for domestic sizes from southern Illinois mines has been quiet, but shipments show a fair increase as compared with the previous month. Lump and No. 1 nut have been in demand, but No. 2 nut has been heavy even at concessions. Threshing coal from Saline County has been moving briskly.

Springfield screenings have been active during the past week, the minimum price being 70c. Domestic sizes are still very slow.

Indiana contract customers are beginning to take a little more coal, so that the operators have a more hopeful outlook. Domestic lump shipments have been increased from Sullivan County mines, but they have not been so active from the Clinton district. Screenings from Clinton mines have been moving in a steady volume, while from Sullivan County they have been dragging. One or two Knox County mines are now sold up fully on contract, and are not in the open market.

Pennsylvania smokeless mine-run, lump and nut shipments are quiet, while the demand for egg has been steady. Prices on all grades of Pennsylvania smokeless in this market have strengthened over last week.

Hocking shipments have been steady at about the same ratio as last week, and country buying is quite apparent. Prices are well held and no consignment coal is on the market.

Eastern Kentucky coals are still quoted at various prices, with the buyer still in control. Slack coal has been sacrificed on demurrage. Some shipments direct from the mines have sold as high as $2 and Millers Creek block and nut have been active at fair prices, with little demand for egg.

Anthracite chestnut is moving slowly, and the demand for all other sizes is very quiet. Some shippers into this territory are trying to force business by cutting prices, but without much success. It is felt that a full tonnage at circular prices is bound to be moving not later than the month of August.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

	191,275	**297,087**

INDIANAPOLIS

Usual midsummer dullness. Some reports of weakening in slack market. Better call for domestic lump from schools and farms. Prices generally unchanged.

About normal summer conditions prevail in the Indiana coal industry. Operators are looking forward to the long-expected improvement in the industrial demand. There is said to be signs of weakening in the screening market, but 85 to 90c. is still obtainable for best No. 4 and 75 to 80c. for others. Mine-run sells at $1.15@1.20 for No. 4 and $1.05 for Nos. 5 and 6.

There is better call for domestic lump, as country schools are now laying in supplies and the demand for threshing is now of some volume. The best prepared lump sells for $1.50 f.o.b. mines; standard grade at $1.40; egg, $1.35. The movement from retail yards to consumers' bins gets gradually larger, as the time draws nearer when there may be an advance in price. The following schedule prevails at the Indianapolis yards:

	Per Ton		Per Ton
Linton No. 4 forked	$3.00	Pocahontas forked lump	$5.50
Indiana lump, forked	2.75	Pocahontas shoveled lump	5.00
Indiana lump and egg, screened.	2.50	Pocahontas mine run	4.00
Kanawha lump, forked	4.25	Pocahontas, nut and slack	3.50
Ohio Hocking lump, forked	4.25	Anthracite chestnut	7.75
Ohio Hocking, washed egg	4.50	Anthracite stove and egg	7.50
Kentucky lump	4.50	Anthracite grate	7.25
Ohio Jackson lump, forked	5.00	Connellsville coke	6.00
Blossburg smithing	5.50	Indianapolis by-product coke (all sizes)	5.50
Cannel lump	6.00		

ST. LOUIS

Prices steadier but movement still light. Screenings softer.

There has been a bracing-up of prices on the finer grades of lump and nut during the past week, but there has not been much movement except to the Northwest, where the thresher demand is still helping out; there has also been some shipping in that direction for stocking. A surplus of Carterville screenings has forced the prices down on all grades of this size and they have been weak at 75 to 80c. while some are said to have been offered at 70.

The quotations at the end of the week were:

	Wilm. & Frnk. Co.	Sparta	Mt. Olive	Standard
6-in. lump	$1.35@1.50	$1.25	$1.35	$0.95
2-in. lump	....	.95	1.25	.85

FOREIGN MARKETS

GREAT BRITAIN

July 9—Welsh steam coals show general quietness without material alteration in the position. Quotations are approximately as follows:

Best Welsh steam	Nominal	Best Monmouthshires	$6.00@6.24
Best seconds	Nominal	Seconds	5.76@6.00
Seconds	$6.24@6.48	Best Cardiff smalls	4.68@4.80
Best dry coals	6.00@6.24	Cargo smalls	3.75@3.96

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is on moderate lines with the tendency firm for the Upper Mediterranean. Rates are approximately as follows:

Gibraltar	$3.84	Naples	$5.64	St. Vincent	$4.80
Marseilles	4.83	Alexandria	6.00	Rio de Janeiro	6.72
Algiers	4.54	Port Said	5.88	Monte Video	6.48
Genoa	5.52	Las Palmas	4.65	River Plate	6.72

Exports—British exports for June and the first six months of the past three years were as follows:

	June			Six Months		
To	1913	1914	1915	1913	1914	1915
Russia	701,764	705,715	3,281	2,144,328	2,009,789	19,420

[1] Includes Azores and Madeira. [2] Including Anglo-Egyptian Sudan. [3] And dependencies. [4] And Canaries. [5] West Africa.

Note—The figures in the above table do not include Admiralty and certain other shipments.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

For the official advertisements of bids wanted see the Contracts-to-Be-Let Section on Page 12.

+Indicates contracts regarding which official information has been received.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

No. 726—New York, N. Y.—Bids on this contract (Vol. 8, p. 76) calling for 2350 gross tons of egg or stove coals for fireboats, divided into three items, were opened on July 19, as follows: Item 1—1150 tons for fireboats in North River, at foot of Bloomfield St. and West 35th St.; John F. Schmadeke, $5.95 per ton, total, $6842.50; William Farrell & Son, $5.93 per ton, total, $6819.50. Item 2—600 tons for fireboat and launch berthed at the Battery. John F. Schmadeke, $5.95, total, $3570; William Farrell & Son, $5.93, total, $3558; Bacon Coal Co., $5.86, total, $3510. Item 3—600 tons for fireboats berthed at the foot of 38th St., Brooklyn, and St. George, Staten Island. Commercial Coal Co., $6.18 per ton, total, $3708. Address Fire Commissioner Robert Adamson, Municipal Building, New York City.

No. 922—New Orleans, La.—Bids on this contract (Vol. 7, p. 1127), which provides for furnishing the local School Board with approximately 2000 tons of anthracite and bituminous coal, will be received until July 26. Address Secy. E. A. Williams, Bd. of Edu., 4th floor, Municipal Bldg., New Orleans, La.

1019—Allentown, Penn.—Bids on this contract (p. 77), which provides for furnishing the Whitehall Township school district with chestnut and stove coal, were as follows: Balliet Bros. & Co., $6.25; R. E. Grammer, $6.25. The board has as yet taken no action on the matter, as additional bids are anticipated shortly. Address Secy. A. N. Kuhns, Orefield, Penn.

1054—Ottumwa, Iowa—Bids on this contract (p. 116), which provides for furnishing local School Board with approximately 1600 tons of screened lump coal, will be received until 6 p.m., Aug. 9. Bids are to include cost of delivery in the coal cellars. Address Secy. J. A. Wagner, Bd. of Edu., Ottumwa, Iowa.

New Business

1096—Kansas City, Mo.—Montgomery Ward & Co. will let a contract for the year's supply of coal for the Kansas City branch about Aug. 1. It uses about 6000 tons of Cherokee mill. Address Purchasing Agent, Montgomery Ward & Co. Kansas City, Mo.

1097—Norwalk, Conn.—The Board of Education at this place will contract some time in August for about 100 tons of anthracite and bituminous coal. The call for bids is advertised. Address Board of Education, Norwalk, Conn.

1098—Huntingdon, Penn.—The Board of Education at this place will receive bids until Aug. 1 for furnishing 250 tons of the best Broad Top coal, bids to include cost of delivery in the cellars of the school buildings as designated. All the coal is to be delivered during the month of August. Address Secy. H. H. Waite, Bd. of Edu., Huntingdon, Penn.

+1099—Jefferson City, Mo.—The State Commissioners will receive sealed bids until 10 a.m., July 26, for furnishing the coal supply to the various state departments for the fiscal year beginning Oct. 1. Address Secy. Cornelius Rouch, Com. of Permanent Seat of Government, Jefferson City, Mo.

+1100—Columbia, Mo.—Sealed proposals for furnishing approximately 14,000 tons of coal during the year commencing Sept. 1, 1915, will be received by the Curators of the University of Missouri until noon, July 28. Address Bus. Mgr. Edward E. Brown, University of Missouri, Columbia, Mo.

+1101—Urbana, Ohio—The County Commissioners will receive sealed bids until noon, July 26, for furnishing 100 tons of anthracite and 50 tons of Jackson No. 2 or Virginia splint coal. Bids should include cost of delivery in the coal bins at the Court House in carload lots as ordered. Address County Audr. O. E. Eby, Bd. of Comrs., Urbana, Ohio.

+1102—Beaver Falls, Penn.—The School Directors of North Sewickley Township will receive bids until 1:30 p.m., July 31, for furnishing the coal requirements at the nine school buildings of the district during the ensuing year. Address Secy. S. O. Swick, Beaver Falls, Penn.

+1103—Wahjamega, Mich.—Sealed bids will be received until 10 a.m., Aug. 6, for furnishing the Michigan Farm Colony for Epileptics with approximately 80 tons of coal per month during the ensuing year; also about 100 tons of anthracite, stove and egg will be required. Address Steward C. W. Gage, Farm Colony, Wahjamega, Mich.

+1104—Springdale, W. Va.—The local school board will receive bids until 6 p.m., Aug. 3, for furnishing 4000 bu. of mine-run coal to be delivered into the basement of the local school house. Address Secy. W. A. Clowes, Jr., Springdale Borough School Board, Springdale, Penn.

+1105—Pierre, S. D.—The Board of Education at this place will receive sealed bids until 8 p.m., July 30, for furnishing 350 tons of Youghiogheny and Pocahontas mine-run coal; 275 tons are to be delivered on or before Sept. 1 and the balance as directed during the month of January. Address Clk. Tom C. McNamee, Bd. of Edu., Pierre, S. D.

+1106—Pennsburgh, Penn.—The Board of Education will receive sealed bids until 6 p.m., July 24, for furnishing and delivering stove coal to the various school buildings during the ensuing year. Bids will also be received separately for both furnishing and delivering the coal. Address Harvey C. Jones, Bd. of Edu., Pennsburg, Penn.

1107—Kansas City, Mo.—The Densmore Hotel will let it contract for about 300 tons of slack during the month of August. Address Purchasing Agent, Densmore Hotel, 912 Locust St., Kansas City, Mo.

+1108—Sharpsville, Penn.—The School Board at this place will receive bids until 7 p.m., July 30, for furnishing from 150 to 200 tons of coal to be delivered at the school building. The best grade of three-quarter screened Pittsburgh coal is required. Address Secy. H. B. Wert, School Bd., Sharpsville, Penn.

+1109—Grenada, Miss.—The local Water and Light Department usually contracts in August for their annual fuel requirements involving about 3000 tons of nut and slack coal. The customary price is $2.50 per ton. Address Supt. S. L. Alward, Light & Water Dept., Grenada, Miss.

+1110—New Bethlehem, Penn.—The School Board at this place will receive bids until July 31 for furnishing mine-run coal to the local schools during the coming season. Address Secy. C. E. Sheffer, New Bethlehem, Penn.

+1111—St. Joseph, Mo.—The Board of Education usually contracts some time in August for their fuel requirements which aggregate about 4000 tons. Standard bituminous lump coal is ordinarily used and the current contract is being filled at $3.17 per ton. The business is let on competitive bids, and a bond for $2500 guaranteeing the satisfactory performance of the contract is required. The business is not advertised, specifications being mailed to all dealers. Address Supply Committee, Board of Education, St. Joseph, Mo.

+1112—Natrona, Penn.—The Harrison Township School Board received sealed bids until July 19 for furnishing coal required at the local schools during the term beginning Aug. 30. Address Secy. Percy M. Kennedy, 76 Vine St., Natrona, Penn.

+1113—Shippensburg, Penn.—The Local School Board is requesting sealed bids for furnishing 100 gross tons of bituminous coal, deliveries to be completed by the last of August. All bids must be in by July 26. Address Secy. C. E. Warren, Shippensburg School Dist., Shippensburg, Penn.

+1114—Hazlehurst, Miss.—The City Water & Light Plant at this place usually contracts some time in August for their annual requirements of coal which amount to about 90 tons of No. 2 lump per month. The business is done on competitive bids, and the usual price is about $1.02 per ton f.o.b. mine. Address Supt. M. L. Slay, City Water & Light Plant, Hazlehurst, Miss.

+1115—Roscoe, Penn.—The local School Board at this place received sealed bids until July 20 for furnishing 1800 bu. of coal to be delivered at the school buildings. Address Secy. John Lee, Roscoe School Bd., Roscoe, Penn.

+1116—Windsor, Mo.—The Board of Education at this place is inviting bids from coal operators until Aug. 5 for furnishing the winter supply of fuel. Address Secy. J. W. McIntire, Bd. of Edu., Windsor, Mo.

+1117—Rockville, Ind.—The local School Board will receive bids until July 24 for furnishing approximately 5000 tons of coal. Address Secy. O. M. Teague, Bd. of Edu., Rockville, Ind.

+1118—Connellsville, Penn.—Sealed bids will be received until 2 p.m., July 31, for furnishing the various schools of Perry Township with coal during the ensuing year. Address Secy. J. R. Martin, Bd. of Edu., Perry Township, Connellsville, Penn.

+1119—Lansing, Mich.—The Industrial School at this place will receive bids until noon, July 29, for furnishing approximately 3000 tons of coal to be delivered in the coal sheds as may be required. Bids are requested on three-quarter steam lump, mine-run and screened coal, and bidders must name the state where the coal is mined. Address Supt. E. M. Lawson, The Industrial School, Lansing, Mich.

+1120—New Orleans, La.—The Board of Education will receive sealed bids until noon, July 26, for furnishing the public schools with coal as required during the coming school year. Specifications may be obtained on application. Address Secy. E. A. Williams, Bd. of Edu., Municipal Bldg., Carondelet and Lafayette St., New Orleans, La.

+1121—Springfield, Ill.—The Illinois State Board of Administration received bids until July 15 for furnishing the various State charitable institutions with approximately 173,400 tons of coal. Illinois coal will be used exclusively with the exception of about 5000 tons of Pocahontas. The coal is to be delivered at 18 plants in 15 different cities and towns. The requirements are as follows: Lump, 1000 tons; mine-run, 42,000 tons; 2-in. screenings, 12,000 tons; 1¼-in. screenings, 114,000 tons; slack, 4000 tons; rescreened nut, 460 tons; Pocahontas mine-run, 500 tons. Payment will be made on a heat basis. Address The Illinois State Board of Administration, Springfield, Ill.

+1122—West New York, N. J.—The Board of Education at this place will receive bids until 8 p.m., July 26, for furnishing 400 tons of pea coal and 200 tons of nut. Address Board of Education, West New York, N. J.

+1123—Indianapolis, Ind.—The Board of Trustees for the Indiana State School of Deaf will receive sealed bids until 10 a.m., Aug. 15, for furnishing approximately 4000 tons of 1¼-in. standard screenings or washed coal, and about 40 tons of nut. The latter tonnage is to be delivered by wagon, and on the former, quotations should be f.o.b. switch at the powerhouse door. A certified check for $500 must be filed with all proposals. Address Secy. Richard O. Johnson, Bd. of Trustees, Indiana State School of Deaf, 42nd St. and Monon R.R., Indianapolis, Ind.

+1124—Ipswich, Mass.—The Board of Education at this place will receive bids until Aug. 2 for furnishing 100 tons of anthracite furnace coal and 200 tons of bituminous. Address Superintendent Ipswich School Board, Room 9, Town Hall, Ipswich, Mass.

+1125—Columbus, Ohio—The Director of Public Safety will receive sealed bids until noon, July 29, for furnishing and delivering 1250 tons of the best quality lump coal to the city prison, workhouse, and various engine houses as may be required. All bids must be accompanied by a bond in the sum of $318.70. Address Dir. of Pub. Safety, B. L. Bargar, City Hall, Columbus, Ohio.

+1126—Hattiesburg, Miss.—The School Board at this place received sealed bids until July 23, for furnishing approximately 200 tons of high-grade coal. Address Supt. F. B. Woodley, 417 Walnut St., Hattiesburg, Miss.

+1127—Indianapolis, Ind.—The School Board at this place will receive sealed proposals until 8 p.m., July 27, for furnishing its fuel requirements during the year ending July 31, 1916. All bids must be made according to specifications and on blanks, which can be obtained on application. A deposit of $500, guaranteeing the satisfactory performance of the contract, will be required. Address Business Dir. John F. Cleland, Bd. of Edu., Indianapolis, Ind.

+1128—North Bergen, N. J.—The Board of Education at this place will receive bids until 8 p.m., July 28, for furnishing the local schools with approximately 600 tons of nut coal during the ensuing year. Address Board of Education, North Bergen, N. J.

1129—West Norfolk, Va.—The Virginia Smelting Co. at this place is in the market for 2000 to 2500 tons of anthracite buckwheat No. 3. Shipments are to begin Oct. 1 and deliveries to be made in 1000-ton cargoes. Address Purchasing Agent, The Virginia Smelting Co., West Norfolk, Va.

+1130—Bremen, Ohio—The School Board at this place will receive sealed bids until 7 p.m., July 24, for furnishing and delivering 200 bu. of screened lump coal to the schools in Rushcreek Township. Two hundred bushels will be required in each district. Deliveries are to be completed by Sept. 1. Address Clk. J. W. McCullough, Bd. of Edu., Bremen, Ohio.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

+No. 616—San Francisco, Calif.—This contract (Vol. 7, p. 795), which provides for furnishing the lighthouse inspector at this place with coal, has been awarded to the **Western Fuel Co.** at $10.55 per ton for Wellington coal in sacks and $7.35 per ton in bulk. Address Lighthouse Inspector H. W. Rhodes, 18th Lighthouse District, San Francisco, Calif.

No. 745—Houston, Tex.—This contract (Vol. 7, p. 917), which provides for furnishing the local Board of Education with coal, was awarded to **Rice & Coles** at $4.50 per ton for Peerless screened lump coal. Richard Cocks & Co. bid $4.64 for Illinois coal, and Sampson & Bearden $4.50 for the same grade. Address W. Peirce, Public School Board, Houston, Tex.

No. 795—Cullman, Ala.—This contract (Vol. 7, p. 1005), which provides for furnishing the local Light and Water Plant with approximately 2400 tons of washed nut coal, has been awarded to the **Blocton-Cahaba Coal Co.** at $1.50 per ton. Address Supt. B. Kiel, Light and Water Plant, Cullman, Ala.

+No. 855—Wilmington, N. C.—This contract (Vol. 7, p. 1085, Vol. 8, p. 76), which provides for furnishing the U. S. Engineers at this place with 13,000 tons of bituminous coal, has been awarded to the **Logan Coal & Supply Co.**, Jacksonville, Fla., the gross consideration being $17,680. Address Maj. H. W. Stickle, Corps of Engrs., U. S. Engineers' Office, Wilmington, N. C.

No. 856—Kansas City, Mo.—This contract (Vol. 7, p. 1085, Vol. 8, p. 40), which provides for furnishing the local Board of Education with approximately 7000 tons of coal, has been awarded to the **Sweeney Coal Co.** on semianthracite lump at $20\frac{4}{5}$c. per bu., and the **J. T. Wellington Co.** on deep shaft Cherokee lump at $14^4/_{25}$c. per bu. Address Pur. Agt. F. S. Casey, Bd. of Edu., Kansas City, Mo.

+No. 904—Uniontown, Penn.—This contract (Vol. 7, p. 1087), which provides for furnishing the local Board of Education with its coal and coke requirements, has been awarded to **John A. Whyel & Son,** at $7 per ton for mine-run coal and $3 per ton for soft coke. E. C. Rich bid $6.90 per ton for mine-run and $3.50 per ton for soft coke. Address C. L. Davidson, Schools District of Uniontown Borough, Uniontown, Penn.

No. 911—Cherokee, Iowa—This contract (Vol. 7, p. 1126), which provides for furnishing the local Board of Education with approximately 300 tons of coal, has been awarded to **Schoenmier Bros Co.**, on La Salle lump coal at $4.50 per ton. Address Secy. William Shardlow, Independent School District of Cherokee, Cherokee, Iowa.

+No. 921—Rensselaer, Ind.—This contract (Vol. 7, p. 1127), which provides for furnishing Jasper County with approximately 400 tons of coal, has been awarded to the **Power Coal Co.**, of Chicago. Address Audr. J. P. Hammond, County Comr. Rensselaer, Ind.

No. 922—Rock Island, Ill.—This contract (p. 76), which provides for furnishing the Standard Oil-Cloth Co. with two cars of screenings per month has again been renewed. No details are available. Address Standard Oil-Cloth Co., Rock Island, Ill.

+No. 928—Quincy, Ill.—This contract (Vol. 7, p. 1127), which provides for furnishing the local Water Department, its annual requirements of coal, has been let to the **Wabash Coal Co.** at $3 per ton for 3-in. screened lump coal. The cost is to include whatever expense the dealer may be put to in weighing the coal on the city scales. This price compares with $2.84 per ton of 4-in. screened lump coal on the contract for the past year. Address, Business Mgr., Clyde L. Sears, Bd. of Edu., Quincy, Ill.

COAL AGE

Vol. 8 NEW YORK, JULY 31, 1915 No. 5

A Touch of Velvet

IT WAS well for our friend the mule at this plant that a humane manager put on his thinking cap and evolved the idea that a mule pushed so hard must of necessity slow down in the late hours of the day when coal was "coming good," thereby "tying up" an entry, superheating the driver's language and overworking his whip arm.

> "Push that mule to the limit; what kills one buys another."
>
> In years past, an order that I frequently heard at a certain mine was: "Push that mule to the limit; what kills one buys another."
>
> At this particular plant one could also hear a driver described in admiring tones as "a great coal hauler." "Why, that fellow kills just about one mule a year—just drives them to death."

We have frequent demonstrations of the fact that a high degree of efficiency is not possible without a feeling among the men of personal interest, and with it, as a natural consequence, personal initiative. In the production of coal this is doubly important, for in each mine there are employed the requisite number of men to take care of the production, based on past records.

To enter into details a little: In each mine we have a certain number of working places that will produce with the necessary equipment and day-labor expense an estimated amount of coal. This may work out all right and come up to expectations. A driver under this system will take care of his stipulated number of rooms and entries and give each loader a fairly good turn per day. Yet if we can add a little personal interest or enthusiasm, it acts like the touch of a magic wand.

The driver no longer borrows the "makins" and "rolls a nail," or sits on the gob while the loader tops off a car. Spurred on by the possibility of reward, by rivalry, or by the hope of establishing some new record, or whatever the incentive may be, he hustles in and out; he "rolls a nail" while waiting for the motor at the passway if someone isn't quite loaded; he helps throw on a few lumps and urges the miner to be ready for the next trip.

Each industry must have its own special way of developing efficiency and applying the improved methods to its own particular case. What would apply to the mining business might not be suitable for other lines of work. But where the day-labor expense is a large factor in the total cost per ton—and this outlay is governed entirely by the number of tons handled per man per day—this incentive to hustle will cause an addition to the tonnage that is pure velvet. There is a marked difference in being made to do a thing and in doing it from a sense of duty and performing the same work of one's own volition.

In planning for production some theories of efficiency are based on system. The work to be accomplished by each employee is based on the average of such accomplishments in the past. To increase this amount without any further expense, there must be some unusual motive, some definite reward that is obtainable. One factor that has an important bearing is to impress upon each employee a sense of responsibility, in order that he will experience pleasure if successful, and disappointment if unsuccessful.

Some corporations or their officials have a propensity for importing men to fill positions of importance. They apparently are possessed with the idea that the most capable men live elsewhere. They never consider that home talent, if properly trained, will exhibit qualities necessary to a successful career. There are few industries that have not on their payrolls men capable of great deeds if started in the right way and with the proper incentive. One means of developing this tendency is to employ a definite system in managing the organization.

Each company official should keep careful watch over the men under him; when a desirable position is vacant, let him give someone a chance who has been faithful and diligent. It should be the purpose of all officials to encourage application and stability, to have each employee feel that with his company there is an opportunity, and that the opportunity is contingent upon competency and the faithful performance of duty. This tends to strengthen the fundamental scheme of the organization; it creates enthusiasm, initiative and competency, which in turn mean efficiency and success.

When Opportunity Knocked

By Edgar White*

SYNOPSIS—The story of two young men, showing how one succeeded and the other failed.

When Opportunity knocks she does not expect that everybody will hearken. It is a safe guess that not one in a thousand recognizes the call. But everyone in the thousand has the chance. In the year 1860 Opportunity knocked at the doors of two strong-limbed, healthy young men of 19. Neither had an advantage over the other in wordly goods. Both were pitifully poor.

Alexander Rector was awarded the contract to dig a 25-ft. well for Wilburn Hughes, a farmer living near the then obscure village of Bevier, Mo. He was to get 45c. a day and board. He thought he was doing uncommonly well. Farmhands were glad to get $10 a month and a place to stay. Alex sang as he toiled, and his well went down day by day. At 12 ft. he ceased singing; his pick encountered slate. Two feet further he struck coal—"black rock," he called it. A drill showed there was 6 ft. of this. He regarded it as an abomination because it would ruin the water unless the well were cased, and even then the stuff might work through. He suggested digging a well in another place, and this time he was not bothered with coal.

The coal discovery didn't excite any particular interest. It gave Rector, who got a job to dig another well, no concern whatever. There was plenty of wood in the forests. Locomotives and steamboats were fueling with cottonwood.

A Macon, Mo., paper printed a brief story of the well-digger's find. By chance a copy of the little weekly got over into Illinois. It fell into the hands of Thomas Wardell, a young Englishman but recently come to America. Wardell was at Kewanee, not waiting for something to turn up, but looking over the field to turn something up. His sole capital was youth, brain and muscle. The next train took him to Missouri. In a week he had satisfied himself of the vast extent of the coal lands and the quality of the product. The farmers about Bevier gladly signed option contracts for anything between the surface of their holdings and China. All they reserved in the bond was a crust thick enough to raise a crop on. Their royalty was a fourth of a cent a bushel. They figured they couldn't possibly lose anything at that, as they burned wood and had no earthly use for coal.

A Proposal to a Railroad President

When Wardell had spiked down enough options to insure the carrying out of heavy contracts he presented himself to the president of the railroad at St. Louis. He told what he had to offer and what he wanted for it.

The president looked at the young man and said:

"Want us to change all our engines so as to give you a job, eh?"

"That is the principal motive with me," he said. "But of course I knew when I came to you that you wouldn't do it unless I could prove that I could deliver all the coal you might need, and that it would be cheaper."

"And you are prepared to show me that?" asked the official.

"I am," replied the young Englishman.

He then produced his maps, showed the depth of the coal and where it lay. His prospect holes determined the character of the material beyond the shadow of doubt, and he brought with him specimens. Having finished the examination, the president was called to look after other business.

"Come around this afternoon," he said, "and I'll talk with you about this business a little further. Where are you stopping?"

Wardell mentioned a cheap tavern near the levee.

"What!" exclaimed the railroad man. "You come down here to negotiate a fifty-thousand-dollar deal and stop at a fifty-cent-a-day house?"

"Exactly so," replied the young man. "I just had barely enough money to make the trip."

"Then how on earth do you expect to handle such a big contract?"

"You sign it and I'll handle it all right."

"You haven't a sign of security in case you fail?"

"I'll assign my coal options to you. You can't lose."

The lad's courageous, self-reliant demeanor won. A banker had agreed to back him as soon as he demonstrated he could sell the coal. He went home with a contract to furnish a certain number of tons of coal per month to the Hannibal and St. Joe engines, and by the time the road was ready for it Wardell had his tipple, engine house and loading chutes waiting.

Made Several Million Dollars

The history of the wonderful coal development of Macon County is practically a biography of Thomas Wardell, the English lad who began operations without a dollar. He died in 1887 the controller of the greatest mining district in the West, and worth over five million dollars. He established schools, fostered churches and built hundreds of comfortable homes for the miners. His own lordly estate, in the suburbs of Macon, was easily worth a million dollars, and his son's home there, built since the great operator's death, comprises the finest residence and park in northern Missouri. The young man has let go of the coal possessions that made his father, and the purchasers, value them at $4,000,000. The normal annual output of the 25 mines is over a million tons.

Alex Rector, the discoverer, abandoned well-digging and went to mining. He became an expert miner and could easily make from $3.50 to $4 each working day. This made well-digging look contemptible by comparison, and he never resumed his earlier occupation. Through all the years of Wardell's big dealings Rector plied his pick and "shot down" his coal, but he never felt the call to control. He was a good miner and a good man. Rector died a while back, full of years and worth about as much as when his pick struck coal—and spoiled his well.

"If it was to do over again," he remarked a few years before his death, "I expect I would act just the same. Responsibility always fretted me. I haven't anything laid by and I haven't had anything to worry me."

---

*Macon, Mo.

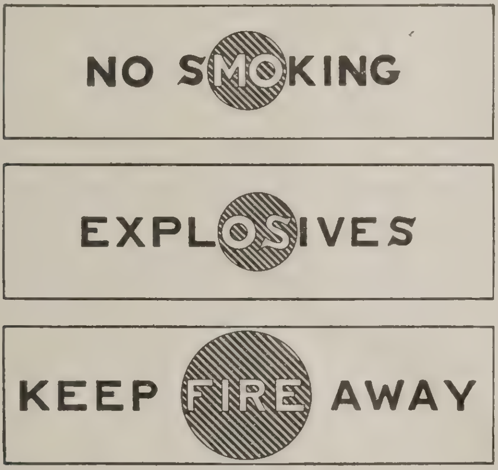
Fire Prevention at Coal Mines

By H. S. Mikesell*

SYNOPSIS—A résumé of the precautions taken to prevent fire and the rules of action to be observed in case of one, as adopted by three coal companies in the Middle West. Three precautionary fire signs are employed. Fire-fighting apparatus must be tested periodically and reports of such tests made to the main office.

Apropos of the foreword in the issue of *Coal Age* of Mar. 27 headed "Do You Appreciate the Importance of Effective Fire Prevention?" the publication of rules to be followed for the prevention of fires at the mines of the Rock Island Coal Mining Co., the Consolidated Indiana Coal Co. and the Coal Valley Mining Co., issued under the direction of President Carl Scholz, may possibly be of interest.

Constant vigilance and cleanliness are the best preventives of fires at mining plants. Standing instructions are in effect at these mines that all officers and employees must give personal attention to the protection of the company's property from fire, and the officer or employee who fails to do this does not perform his full duty, even though the property concerned may not be directly where he is employed or working. The rules and regulations covering surface plants follow:



PRECAUTIONARY FIRE SIGNS NOS. 1, 2 AND 3

STORAGE AND USE OF EXPLOSIVES, OILS, ETC.

1. Oil for company's use in shops and warehouses, except where a small quantity is kept on hand, should be kept outside of main buildings. Wherever it is practicable to do so, arrangements should be made to keep it in a building designed for the purpose; in all cases a metal lined box with a sand base shall be provided on which to clean and fill lamps and keep oil cans.

2. Explosives should not be used or stored except under prescribed conditions.

3. The use of benzine, gasoline or naphtha for mechanical purposes in any building will not be permitted, except in cases where the written approval of the general manager and insurance department, both as to quantity and purpose, has been obtained. When used, it should be only in restricted quantities, by daylight only, and from approved safety cans. Where gasoline power is used, special care should be given to oil pumps to see that oil is not leaking.

4. Supplies of benzine, gasoline or naphtha must be kept only in structures especially provided for the storage of those fluids.

LIGHTING AND HEATING

5. Gas and lamp fixtures must be rigid. Burners must be protected by wire guards or globes so that heat or flame cannot reach woodwork or other inflammable material. Woodwork above or alongside gas jets or lamps must be protected with asbestos board and tin.

6. Kerosene oil lamps with glass fonts are objectionable. Lamps with metal fonts must be used.

7. Paper or pasteboard shades must not be used on any light globe. Metal or porcelain should be used.

8. Place wire guards on all electric-light globes used in record rooms and see that lamp cords are short enough so that lights cannot be placed inside pigeonholes or on shelves.

9. The use of torches is attended with danger, and every precaution should be exercised when they are used, both as to handling and storing. They must be kept in metal receptacles when not in use and not in wooden closets.

10. The use of open lights in powder houses, oil houses, paint houses, etc., and where inflammable vapors or dust are present is prohibited.

11. The use of gasoline stoves for cooking or heating purposes or of gasoline for lighting in warehouses and other buildings is prohibited unless by consent of the general manager.

12. Furnaces, stoves, pipes, flues and chimneys must be thoroughly examined by the employees in charge as often as necessary for defects which might entail risk of fire. These defects must be speedily remedied.

13. Portable furnaces using petroleum oils should be removed from buildings when not in actual operation. See that all oil is turned off at main supply tank at night on all oil systems.

14. Pails of fine dry sand should be maintained at all places where oil and grease are stored.

15. Furnaces and stoves for heating buildings must be securely set on stone, concrete, cemented brick or metal. Woodwork near furnaces and stoves or stovepipes must be protected by sheet metal and air spaces must be provided where stovepipes pass through woodwork. Stovepipes must not pass through concealed places, such as an attic, or enter a flue in concealed places. The stovepipe inside of a building must be in plain view. Where stovepipes pass through record and file rooms, care shall be taken to see that papers are kept sufficiently far away from them and that a metal guard or screen is provided to prevent contact.

POWER

16. Steam pipes must rest on metal supports and not be placed too close to woodwork. They should be kept free from greasy or oily waste and other inflammable material. Clothing must not be hung on or near steam pipes.

17. Dust must not be allowed to accumulate on top of boilers, and tops of boilers must not be used for drying combustible materials.

18. Dynamos, motors and electric-light wiring in buildings must be properly insulated and equipped with safety devices. Wiring should be overhauled and inspected regularly and kept up to standard, especially in buildings where the wiring is not of recent installation. All telephone wires before entering buildings of the company should be protected by lightning arresters, and in cases where they are liable to come in contact with high potential wires, by excessive current protectors. No person should be allowed to make alterations or repairs of any kind to electrical equipment or apparatus except upon the authorization of the general superintendent. Wiring of all kinds must be installed and maintained according to the rules of the National Electric Code.

19. Smoking is prohibited in powder houses, magazines, stable buildings, shops, storehouses and warehouses and at all points where inflammable materials are handled. Lighted cigarettes, pipes and cigars must not be brought inside of buildings. Signs to that effect should be posted conspicuously.

20. Greasy and oily waste must be kept in approved metal cans, with self-closing covers. Waste cans must be emptied at the close of each day's work, as the combination of oil and waste or rags under certain conditions will cause fire by spontaneous combustion.

---

*139 West Van Buren St., Chicago, Ill.

21. Sawdust must not be used in spittoons; sand must be used. Wooden spittoons are prohibited.

22. The use of matches in and around buildings should be avoided as much as possible; but when they are necessary, safety matches should be provided and care should be taken to see that they are extinguished after being used. When kept in stock, metal boxes should be provided for them.

23. Dirt, rubbish and inflammable material must not be allowed to accumulate in or about tipples, shops, warehouses, buildings or premises of the company. Attic space must not be used for storage purposes.

24. Oil lamps must not be filled after dark or near a fire, and where such work is done care should be taken to keep the surroundings free of oil saturation by having metal-covered stands provided on which to do that work.

25. Ashes must be handled in metal utensils and be removed every day. Ashes must not be kept in wooden boxes nor thrown against sides of buildings or platforms.

26. The use of unventilated wooden closets for men's clothes and supplies is not approved. Well-ventilated metal closets or lockers (to be kept away from wood structural material) are recommended for workmen's clothing and tools.

27. All dry grass, weeds, etc., must be removed if near wooden structures.

28. Fire barrels must be kept filled, and salt or calcium chloride be added to the water in them where it is likely to freeze. Fire hose, fire plugs and other fire appliances must be tested and kept in good condition, fire brigades be organized and drilled at least monthly and employees be instructed as to the use and method of handling fire extinguishers. A good supply of barrels and fire pails should be provided for all shops, warehouses and tipples.

29. General superintendents will appoint at each mine a responsible employee to act as fire chief. The fire chief will be in direct charge of the fire brigade and will be held responsible for the efficient condition of all fire-fighting apparatus on the premises. He will inspect all property thoroughly and regularly to see that premises are kept clean and free from any features which might cause fire. He will further complete and submit to the general offices once every 10 days a report of practice run of fire brigade on form 2617.

30. Where there are locked fire-alarm boxes near or in shops, warehouses and other buildings, the key must be procured and hung up in a conspicuous and accessible place. Fire-alarm boxes or wires should not be attached to buildings.

31. General superintendents will post warning signboards in conspicuous places on powder houses, magazines and stable buildings and on such other buildings where signs are necessary. On powder houses and magazines, use signboards Nos. 2 and 3, as shown on p. 161. At entrance to gaseous mine or district, use signboards Nos. 1 and 3, as shown. On and in stable buildings, use signboards Nos. 1 and 3, as shown. Wherever smoking is prohibited, use signboard No. 1. On and in oil houses, shop buildings and storehouses, use signboards Nos. 1 and 3. These signboards may be made of wood alone, wood covered with sheet tin, iron or copper, or of solid sheet copper, or of steel. The background must be painted white. Lettering must be in black, except lettering in center of red symbol, which must be white. (See illustration.) The center symbol must be bright red. Signboards must be 4 ft. 6 in. long and 16 in. wide. Lettering must be 3 in. in height.

REPORTS TO BE FURNISHED PERIODICALLY

1. Regular monthly reports are rendered the general office showing progress made in carrying out the recommendations of the Insurance Department for improved fire protection, which are made by inspectors at intervals, showing by item and survey numbers the status of each recommendation.

2. General superintendents forward to the general office once each month form CT-117 showing corrections to be made in the insurance schedule.

3. Fire brigade chiefs submit to the general office once every 10 days a report of practice run of fire brigade on form 2617.

4. Requisitions are made promptly on the purchasing department for supplies necessary to carry out instructions contained in the rules and regulations for the prevention of fires.

At each group of mines a fire-fighting force is organized with a brigade established at each mine. Fire drills are run at intervals so that all employees both inside and outside of the mine know their respective places of duty and the work expected of them in case of an emergency.

Pipe lines are established under pressure near the bottom of shafts, both upcast and downcast, with connections to hose and pipe lines leading over different portions of the mines.

Underground telephone service is established in each mine to the most important inside stations, principally where hoisting motors are located, so that help can be quickly called. This telephone line is connected with each local office headquarters and also with the mine office. Gongs are placed whereby a general alarm can be sounded from the surface or the shaft bottom to the inside partings, from whence information can be carried by drivers to the men in case quick retreat is desired.

TIMBERS ARE PROTECTED

A pulp-plaster covering for timbers at the shaft bottom is used in order to render them more nearly fireproof, and holes and openings which would lead flames back of timbers are closed and sealed with pulp plaster as well.

No underground stables for mules are permitted, and all mules are lowered into the mine at the beginning of work and taken out at quitting time in the evening.

No oils are permitted to be taken back any distance into the mines, particularly gasoline and kerosene. The places where pit cars are oiled are covered with ashes, cinders or sand, which will absorb the oil and enable it to be readily loaded out. This prevents the oil from saturating the slate flooring and timbers. Not more than one day's supply of oil for lubricating pit cars is allowed in the mine at any one time. Before pit-car oil is taken into the mine it is tested with an open light placed over the vessel in which it is contained to see that the vapors are not inflammable or will not ignite.

In addition to the check system, a bar chain is put across the entry at least 15 ft. from the cage bottom in each mine, to prevent crowding of men to a place nearer than this distance in case of trouble. Large quantities of scrap pipe which are practically worthless are filled with concrete and used for permanent cribbing to prevent fire hazard, instead of using wooden timbers.

Lamp houses are located on the surface convenient to the shaft opening. All lamps are filled on top, and no lamps are filled at the bottom of the shafts or elsewhere underground.

RULES GOVERNING ACTION IN CASE OF FIRE

The following fire rules are in effect:

1. All fire equipment shall be tested each week in actual drill, both on the surface as well as in the mine workings.

2. The alarm of fire on the surface shall be short continuous blasts of the steam whistle.

3. The ringing of the electrical alarm gongs indicates fire in the underground workings, the signals being as follows: (a) Continuous unbroken ringing of the gongs means that all employees should go to the main shaft. (b) A succession of short rings of the gongs means that all employees should go to the escapement shaft.

4. Upon hearing the fire-alarm gongs it will be the duty of the pit boss and his assistants to go to their respective stations at the bottom of each shaft, as directed by the superintendent, to give directions and preserve order.

5. After the fire alarm has been given, either on the surface or below ground, no coal except that on the ascending cage must be hoisted, and both cages must be immediately relieved of cars.

6. All men upon hearing the alarm of fire must immediately go to their respective stations and prepare the pumps, hydrants, hose and chemical extinguishers for action.

7. Hoisting engineers must remain in the engine room and obey regular signals and the orders of the superintendent or mine manager.

8. The firemen must remain at the boilers unless otherwise directed by the superintendent or pit boss.

9. The head dumper or weigh boss, as may be directed, shall have charge of the gates and guard the shaft at the surface landing and attend to mine signals.

10. The bottom cager will retain charge of the cages and attend to fire-alarm and other signals at the shaft bottom.

11. The machinist's duty will be to stand by and attend to the fire pumps only.

12. It shall be the duty of the head blacksmith to open valves for conveying water to the fan house and all water pipes on the surface and in the mines.

13. Certain assigned duties shall be given to a sufficient number of men to take charge of valves connected with all underground fire pipe lines, handle the hose on the surface and in the workings and take charge of the chemical extinguishers, in the surface buildings as well as in the mine.

14. Under no circumstances must hay be permitted to be loaded into a car and sent into the mine until all miners of the day shift are on the surface, and it must then be lowered into the mine only after it has been inspected by the hoisting engineer or top foreman to see that it has been thoroughly wet to make it impossible of ignition from any cause, and the hoisting engineer on duty at the time is charged with the knowledge of such inspection.

15. The first duty of the night watchman or such other person as may be designated by the superintendent (when the weather permits) shall be to unreel two lines of hose (one on each side of the mine) and open the hydrant valves.

16. On the discovery of fire at night, the steam whistle must be blown continuously and the electric alarm gongs sounded as indicated in Rules 2 and 3.

17. The night forces must, upon the alarm of fire, go to their regular stations and duties as assigned to them by the superintendent.

The greatest degree of protection and safety to life and property can only be secured by cool, active action on the part of those in charge of the supervision of the forces and those in charge of the fire apparatus, as well as by calmness and good order on the part of all employees in leaving the mine.

Fire apparatus must not be handled by anyone except those authorized to do so, and then only in case of fire or for the purpose of drill or repairing. Any person known to have mutilated or damaged any part of the fire machinery and appliances will be prosecuted, and in addition thereto will, if an employee, be discharged.

USE OF FIRE EXTINGUISHERS

The following instructions are in effect governing the use and care of fire extinguishers:

The employee in charge of the building in which chemical fire extinguishers are located is required to see that these extinguishers are kept in their proper location, clean and in order for immediate use at all times, and that a proper record of the date when each was last charged is registered on the tag attached to the extinguisher. Except in case of fire these extinguishers are not to be tampered with or discharged, other than for testing purposes once each year, on July 1, on which date all chemical extinguishers must be discharged and recharged. Requisitions for recharge should be made on the purchasing department and should specifically state the capacity and makers' name of the extinguisher.

A report is made twice a year showing in what buildings fire extinguishers are located and the number in each place, number of recharges on hand, if rubber connections are in good order and if there is a fire-extinguisher placard, issued by the insurance department, posted near each extinguisher, giving instructions for its use and care.

All employees, particularly the fire brigade, are instructed as to the use of fire extinguishers and their location. All fire extinguishers are recharged a week or ten days after July 1 of each year, and a tag is attached to each fire extinguisher showing the date of recharging. Fire extinguishers are filled with a solution of sulphuric acid, sodium bicarbonate and water in proper proportions. The extinguisher used is the one manufactured by the Northern Fire Apparatus Co., Minneapolis, Minn., and is the standard adopted for all mines.

All boilers are covered by insurance against explosions, and inspections are regularly made by representatives of the Insurance Department and the insurance company carrying the risk, with reports rendered showing condition of boilers and repairs needed. Boilers are not permitted to be operated under steam pressure above that stipulated by the insurance company. Violation of this rule results in the discharge of the employee at fault. All boilers are numbered consecutively at each plant, and a statement is rendered twice each year showing the location, nature of the building in which it is housed, type of boiler, allowable steam pressure, size of the boiler and the purpose for which it is employed.

⁂

Carbonization of Peat

The Swedish experts commissioned to examine Laval's method of carbonizing peat, says *Commerce Reports*, submitted their report on Mar. 19. Briefly stated, the processes employed in this method are as follows: The peat is diluted with a large quantity of water. The resulting pap is then heated to a temperature of 150° to 250° C. (302° to 482° F.). The chemical changes thus produced leave a dry mass of an increased heat value, though reduced in volume, the physical constitution of the material being altered in such a way that water can be removed in a much larger proportion.

By artificial drying peat powder is then easily prepared, to be used in the manufacture of briquettes. With a small apparatus the commission had no difficulty in preparing a product containing only 52 per cent. of water. The experts were of the opinion that a small plant manufacturing 10 tons of peat fuel per day would have to reckon with a cost of at least 15 crowns ($4.02) per ton of peat powder containing 10 per cent. of water and having an effective heat value of 4800 calories, the cost not including interest or amortization. In their opinion, however, better results might be expected for a larger plant manufacturing at least 50 tons of fuel per day. Here the cost was reckoned at 13 crowns ($3.48) per ton, including interest and amortization.

Under normal conditions a majority of the experts believed such peat fuel could be sold with profit. Captain Wallgren, one of the five experts, filed a dissenting opinion. He calculates the original cost of producing 1 ton of water-free peat powder, with an effective heat value of 5240 calories, at 11.21 crowns ($3), exclusive of interest and other charges, which would increase the cost of production to 15 or 16 crowns ($4.02 to $4.29). He holds, therefore, that peat fuel cannot compete with coal under normal conditions. The possibilities of improving the working methods, however, are great, and should the prices of coal remain high, even after the war, the prospects for marketing peat fuel will be good.

The weight in pounds per 1000 ft. of any electrical conductor may be found by multiplying its area in circular mils by the pounds per 1000 ft. per circular mil.

The Canadian Collieries, Ltd.

By E. Jacobs*

SYNOPSIS—After meeting and discussing fully the affairs of the company, the bondholders of the Canadian Collieries, Ltd., voted unanimously to waive default of payment of interest on the bonds for three years or until one year after the conclusion of peace in Europe.

At the annual meeting of the Canadian Collieries (Dunsmuir), Ltd., held in London in March, the affairs of the company were fully discussed and resolutions unanimously adopted waiving the defaults which the company had made on Sept. 1, 1914, and Mar. 1, 1915, in payment of interest on its bonds.

This waiver covers a period of three years; that is, until Mar. 1, 1918, or as the resolutions prescribed "to the half yearly date for payment of interest upon the bonds occurring next before the expiration of one year from the formal conclusion of peace between Great Britain on the one hand and Germany and Austria on the other hand (whichever period may be the longer). Then the bond interest shall be payable only as and when and to the extent that the net profits of the company as certified by the auditors of the company for the time being are sufficient to pay the same, any arrears of such interest being nevertheless carried forward and paid out of the net profits of any subsequent year."

The reason for this and other modifications of the trust deed of Aug. 6, 1910, securing the 5-per cent. first-mortgage gold bonds of the company, were fully explained at the meeting. As the chairman pointed out, there were three alternatives open to the bondholders: (1) They could establish a receivership, (2) they could commence the foreclosure of the mortgage, or (3) they could waive the default and extend the time for payment of the bond interest.

The last-mentioned alternative was unanimously adopted, and to that end the meeting appointed a committee of five of the bondholders. In this committee was vested a voting trust, giving it entire control over the administration and management of the company. The five members are Stanley C. Boulter, Robert H. Benson, David A. Bevan, John A. Mullens, Jr., and Ernest G. Ridpath.

The full report of the meeting includes many interesting features. W. E. Rundle, general manager of the National Trust Co., Ltd., trustee for the bondholders, presided. During the discussion he stated that Sir William Mackenzie (of Mackenzie & Mann, of Toronto, Ont., at the head of the Canadian Northern and the Canadian Pacific railways) is now a director of the National Trust Co. E. R. Wood and F. H. Phippen are also directors. He also stated that of 22 directors of the National Trust Co., only two were also directors of the Canadian Collieries Co., and he gave assurance that those two had not at any time attempted to influence the trustees with regard to anything arising out of the trusteeship; also that the National Trust Co. had ably administered this trusteeship. So far as the National Trust Co. is concerned, the chairman stated that it has no interest in the Canadian Collieries company save as trustee. It does not

TIPPLE OF THE NO. 8 MINE OF THE CANADIAN COLLIERIES CO.

---

*Victoria, B. C.

MINERS' DWELLINGS AT NO. 8 MINE, CANADIAN COLLIERIES CO.

REINFORCED-CONCRETE SUBSTRUCTURE OF TIPPLE OF NO. 8 MINE

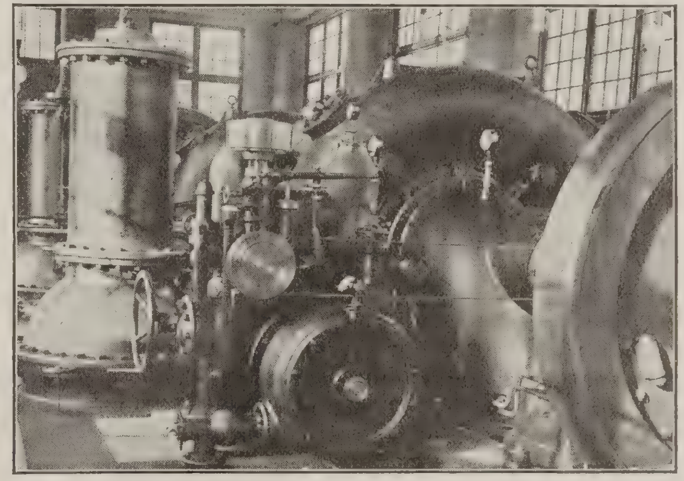
own a dollar's worth of bonds or stocks in the Collieries company nor any stock in the Canadian Northern Ry.

H. S. Fleming, chairman of the Executive Committee of the Canadian Collieries company, explained at length the causes leading to the present condition of the firm. After reviewing the two years' strike of the miners, he referred to the trade depression, saying in this connection: "To show you the direct effect which this has had upon the position of the company, I may state that during last winter the total consumption of domestic coal in the city of Vancouver was barely one-half of what it had been two years before. This of course affected all the coal-mining companies on the British Columbia coast, but the Collieries company most, for the reason that it is the largest. The use of coal for industrial and public purposes has been similarly cut down. The war disorganized shipping, and there was and is little demand for supplying ships' bunkers with coal; in addition, there was the increased use of fuel oil."

SUBSTANTIAL PROFITS CAN BE EARNED

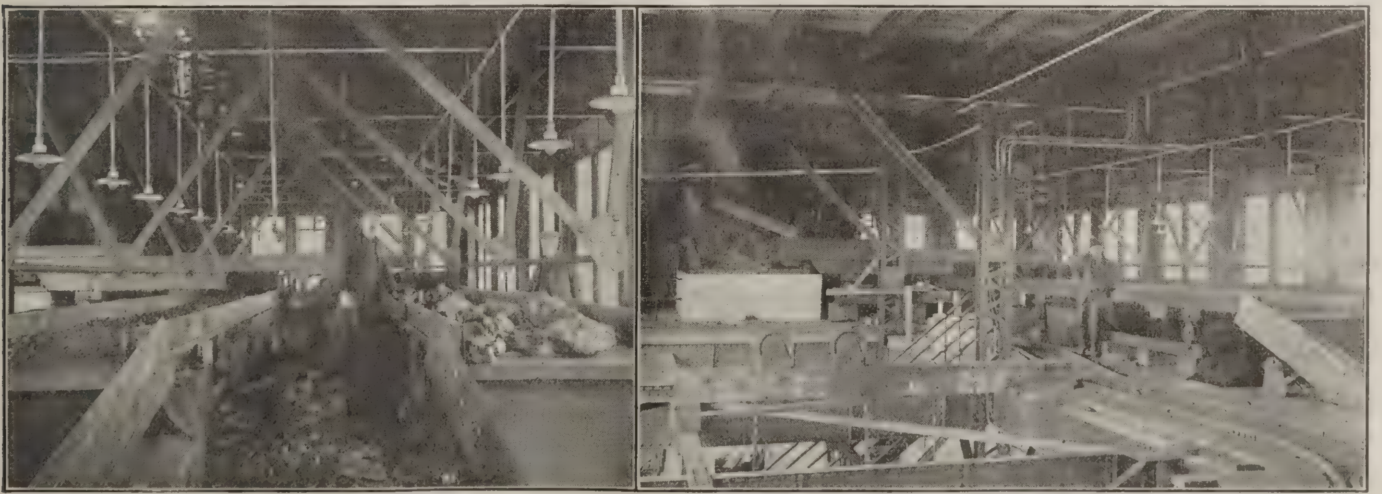
It was stated, however, that with large orders received from San Francisco and elsewhere during August and September of 1914 the company in those months earned net profits of $46,000 and $54,000 respectively, but in October and November following, the net profits were only $1300 and $1100. It is believed that the August and September results show that if given even a moderately good market for the coal the company's mines are capable of earning substantial profits, and that the money put into the property has not been wasted. It is confidently believed that the market is certain to come sooner or later, that the war cannot last forever, nor will the depression of trade. The Pacific Coast will begin to grow again in population and in industry.

Replying to a question regarding the serious shrinkage of the profits between the times the mines were worked by the Dunsmuir interests and the date of the statement of accounts presented, Mr. Fleming said that the operating earnings in the year ended June 30, 1911, were $665,000 from the mines or $728,000 from all sources. During the next year they were $546,000 from the mines and $751,000 from all sources. During the succeeding year there was a strike which practically stopped operations at the mines for a short time and made it difficult to produce coal.



INTERIOR OF POWER HOUSE

In regard to the money subscribed, $3,500,000 of this has gone into improvements in the mines and property



MARCUS SCREENS IN NO. 8 TIPPLE IN OPERATION INTERIOR VIEW OF NO. 8 TIPPLE DURING CONSTRUCTION generally. A considerable sum subscribed has not been taken as working capital owing to the Dunsmuirs not having delivered to the company all the assets that were expected would be received; but a decision as to this was now being obtained from the Privy Council of Great Britain. No directors of the company receive a salary except two local directors who are each paid $500. Many other questions were answered before the resolutions were voted on and adopted unanimously, as has been previously stated.

The Anthracite Decisions

By Our Philadelphia Correspondent

SYNOPSIS—The Delaware, Lackawanna & Western R.R. has been found to be operating unlawfully and has made the necessary readjustments of its management. The Philadelphia & Reading Coal & Iron Co. was found to be conducting its business lawfully, but the relation between the Central Railroad of New Jersey and the Wilkes-Barre Coal Co. must be dissolved.

The two recent court decisions involving the Reading and the Lackawanna anthracite interests coming practically at the same time have served to focus interest on the apparently divergent decisions in the two instances. However, the difference between the two decisions, as suggested, is really only on the face, and as a matter of fact the results are so likely to tend to the same end that it is worth while to study them together.

In the first place it is well to remember that the suits were brought by the United States Government, both being based on the commodity clause of the Hepburn Act of 1906, the provisions of which became effective May 1, 1908, and in express terms prohibited any railway company engaged in interstate commerce to both mine and transport coal; or in still plainer words: "No railroad company can engage in the coal business; its sole purpose is that of a carrier of goods for other people."

It is also important to bear in mind that while the decision in the Lackawanna case was handed down by the United States Supreme Court and is final, yet the decision in the case of the Reading was the verdict of the United States District Court for Pennsylvania, and this opinion is subject to review by the United States Supreme Court, which appeal will probably be taken.

As stated, the decision in the Lackawanna issue was made by the United States Supreme Court and was a reversal of the opinion delivered by the United States District Court for New Jersey, from which opinion the Government had appealed. The decision of the Supreme Court, which was unanimous, was that the Delaware, Lackawanna & Western R.R. did violate the commodities clause of the Hepburn law, and practically the entire evidence adduced to sustain this decision was based on the now celebrated "65 per cent. contract." This contract provided that the coal company should buy from the railroad company (which latter company both owned and operated the mines) all the coal mined, the price to be paid the railroad company to be 65 per cent. of the New York price on the day of delivery. The coal company was also prohibited from buying coal from any other company without permission from the railroad company.

It was contended that the nature of such a contract made it possible for the railroad company to charge exorbitant prices to the public; raise the New York prices; influence prices by the failure to make prompt delivery or by suspending operations in times of urgent need, thereby tending to increase the New York price; together with a number of lesser and minor objections.

Ability to Injure Should Not Be Urged as a Proof of Intention

Strictly and literally construed the companies under this contract could do all the things imputed to them; that is, such wrong-doing was within the bounds of possibility; but the essential point brought out in the Supreme Court decision was that *the companies did not do any of them,* and as a matter of fact the Delaware, Lackawanna & Western R.R. never could do any or all of the things so mentioned, for the very reason that that company only produces 10 per cent. of the entire output of coal.

The potential element for evil in the contract was very much less than that of Jake Landis, an aged contractor who built a church. He had made a blunder and was sore perplexed. A venerable deacon stood within the walls of the church and rushed up to one of the stone masons, tears streaming from his eyes:

"Choe, tell Chake not to swear!"

"He's not swearing," answered the man.

"Yes; but he might!" bawled the deacon.

And just so it was admitted in the opinion as written by Justice Lamar, although not in just that way. He said: "It is argued that the present objections to the contract are purely academic," or in the words of the layman, technical. Continuing the justice says: "But the validity of the contract depends upon its terms," and these terms the court has just decided are unlawful, even though they have harmed no one. It is the law, and the court says in its interpretation or reading of the law that the railroad company was a seller of coal on the one hand, and the coal company, as a coal company, was neither an independent buyer nor a free agent.

The decision directs that the railroad company shall entirely disassociate itself from the coal company, and as is already well known such steps have been taken by the latter company. A few days ago an entirely new directorate was elected, none of whom were officials in the railroad company. The offices were removed so that they would no longer be in the same building with the railroad concern. The coal company will be a free agent in the purchase of coal, for it will not only take fuel from the railroad mines at a fixed price, with the 65 per cent. clause eliminated, but it will have perfect freedom to purchase from any one offering to sell.

The decision is most helpful in that it plainly interprets the law for the guidance of all. The coal companies are law-abiding, as is proved by the fact that the "Lackawanna" changed its contract over a year ago in order to comply with the law, but the present suit was based upon the existence of a contract prior to that time. In this connection President Loomis, of the Delaware, Lackawanna & Western R.R. Co., states: "We are anxious to do anything that is asked of us by the court. We have nothing to conceal, and we are glad to have a final decision for our guide."

In referring to the recent decision of the United States District Court in favor of the Philadelphia & Reading Coal & Iron Co., it will be well to recall that three years ago the Government brought suit against all the anthracite roads as a general combination, which suit was lost. After this decision the Government decided upon suing the so-called smaller combinations, and the present decision is the outcome of the suit started against the Reading company two years ago.

Philadelphia & Reading Coal & Iron Co. Completely Exonerated

In this decision, as written by Judge McPherson, with the concurrence of Judges Buffington and Hunt, the Reading company is adjudged not guilty of a violation of the commodities clause of the Hepburn act. The decision states that the evidence did not show that the Reading had any connection with the Lehigh Coal & Navigation Co. except a minor but nevertheless legal agreement made in 1871; that there was no evidence of injury to any coal dealers; that the company never demanded a high price when coal was in greatest demand, although it was shown that this was a common practice among individuals. Neither was the price of coal at any time unreasonable when it was considered in the light of the profit returned to the company. This was conclusively proven to be 18c. per ton, and even when some miscellaneous receipts were added the profit was only raised to 20c.

The decision further stated that while the connection of the Lehigh & Wilkes-Barre Coal Co. with the Central R.R. of New Jersey had not been brought into question, yet the court advised that inasmuch as the Reading company controlled the C. R. R. of N. J., the Lehigh & Wilkes-Barre Coal Co. should be separated from the transportation company, as "the union of control by the railroad company is objectionable."

The remainder of the decision shows that the Philadelphia & Reading Coal & Iron Co. is a separate and distinct corporation in its relations to the Philadelphia & Reading Ry.

To a close observer this separation has been going on over a period of years, in compliance with decisions handed down some years since. It actually began as far back as 1906 when all the employees of the Philadelphia & Reading Coal & Iron Co. were deprived of free transportation on the Philadelphia & Reading Ry., a privilege which they had enjoyed on equal terms with the railway employees. The separation continued in various ways until the retirement of C. E. Henderson, who for years had been second vice-president of the railway company and general manager of the coal company. At that time the coal company elected a general manager separate and distinct from any affiliation with the railway company, and finally two years ago upon the death of George F. Baer the coal company elected its own president.

It can now be truly said, because of these two apparently diverse decisions, that the Delaware & Lackawanna Coal Co. and the Philadelphia & Reading Coal & Iron Co. both have the same corporate status in the eyes of the law, the only point of difference, if it can be so called, being that the Philadelphia & Reading Coal & Iron Co. arrived at that point several years ahead of the Lackawanna company.

Companies Can Devote Energy to Mining

Now since these two companies have adjusted themselves to the requirements of the law, as clarified by the two decisions, it is right and proper to state that they have not at any time, to use the words of the decision in the Reading case, "consciously and deliberately violated the law, for the commodity clause of the Hepburn act of 1906 rendered unlawful many things which were lawful under the statutes of the states," previous to the enactment of the Hepburn law of 1906, and it was these state statutes under which the companies were operating.

The two decisions should certainly be of great benefit to all anthracite-producing companies, as it clearly indicates to them what they can and cannot do under this act. Now that the law is clearly defined for the first time, the companies can take courage and devote all their time and energies to developing their business, as every business organization is entitled to do. Their energies will be no longer diverted to defending their lives, and they will be saved the enormous expense entailed in that defense. This expense, too, it must be borne in mind, has been added to the price paid for coal by the consumer.

⁂

Slight Improvement in Coal Mining Business

The output of bituminous coal in the United States for the first six months of 1915 is estimated by C. E. Lesher, of the United States Geological Survey, to be between 180,000,000 and 190,000,000 short tons, the rate of production having been from 85 to 90 per cent. of the average for the previous year. Thus the bituminous coal production during this six-month period has been considerably less than for the corresponding period in 1914 and is little, if any, greater than the output during the last half of that year. The rate of production this year decreased after January, reached low ebb in March and April and is now increasing. The states west of the Mississippi River, which in 1914 produced less than 13 per cent. of the total, do not appear to have suffered from this decrease as much as the states east of it, reports from certain districts in the West showing an increase in the production over that of 1914.

This is attributed to the increase in metal mining and smelting and to greater railroad activity. In the East the loss of bunker trade on the Atlantic seaboard and the slowness of the lake season have been only partly offset by the increasing coal exports. The recent activity in the iron business has been slow to affect the coal trade, although coke has gained considerably during the last two months and for the rest of 1915 the increased output should continue.

The anthracite producers have fared better than the soft-coal operators, since it is estimated that the output of anthracite has fallen off only from 3 to 5 per cent. below the average for 1914.

Raising Mushrooms in a Coal Mine

By Theodore F. Imbach*

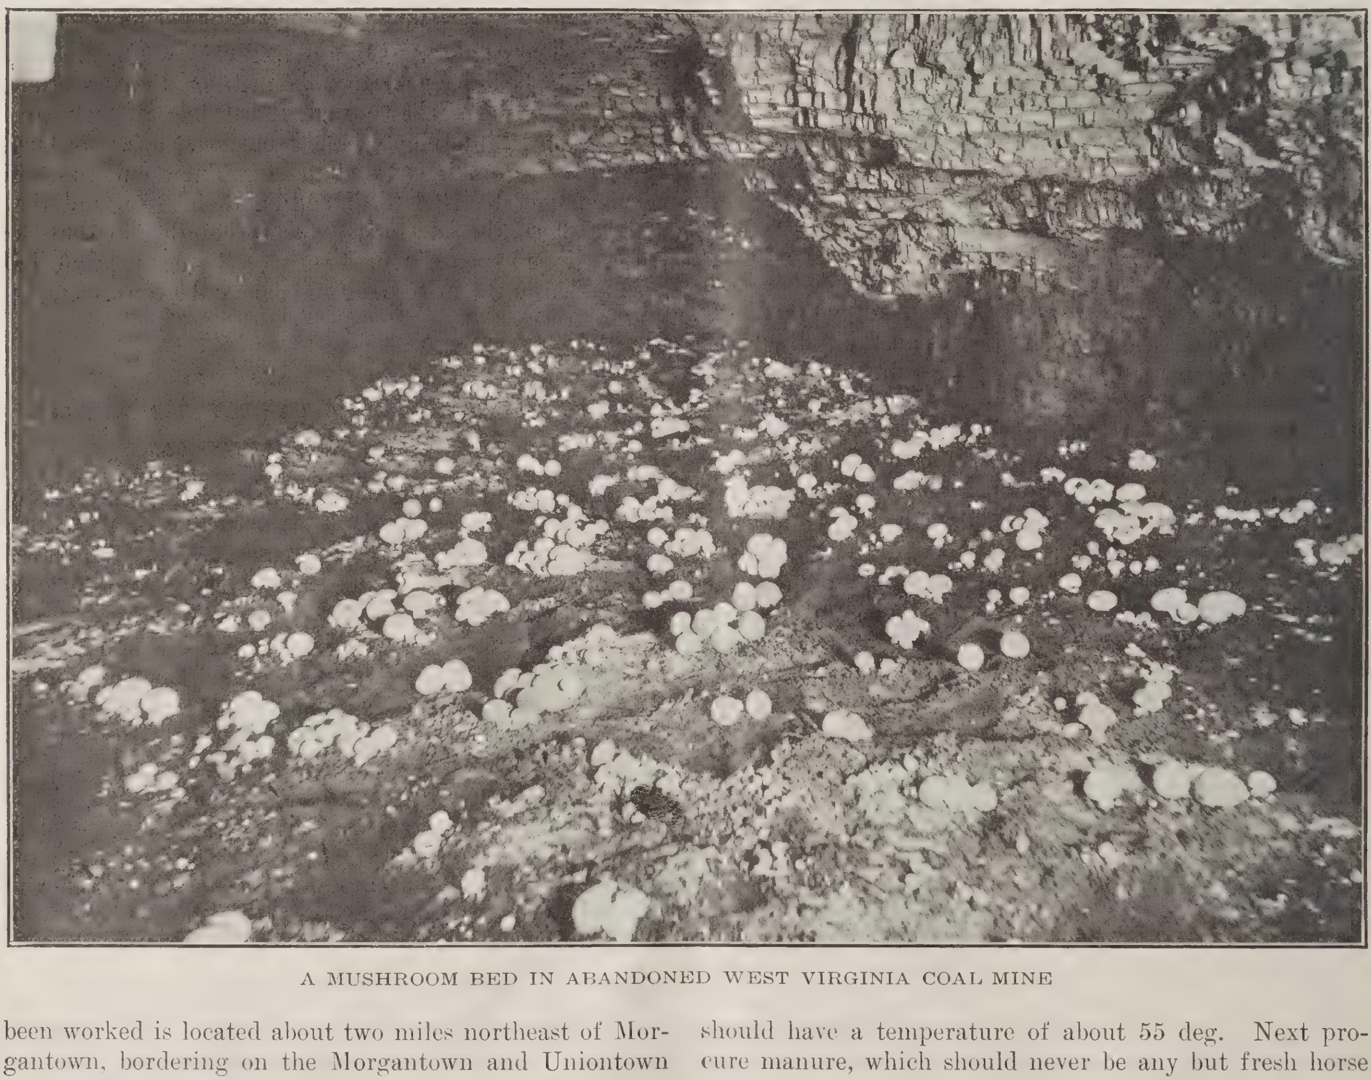
SYNOPSIS—An interesting detailed description of a successful venture in mushroom cultivation. Many abandoned coal mines are ideal places to grow this table delicacy. There is a ready market for a large production.

The abandoned mine in which I first began growing mushrooms in 1911 is located in what is known as the Pittsburgh coal seam in Pennsylvania and West Virginia. The elevation of this seam above sea level at the mine referred to is about 1200 ft., or about 400 ft. above pool level in the Monongahela River at Morgantown. The "state farm" under which this mine has been worked is located about two miles northeast of Morgantown, bordering on the Morgantown and Uniontown pike. The mine was first opened up on the south end of the farm in 1845 by Joseph Ridgeway, and the coal was used mostly for domestic purposes.

From 1860 to 1890, when the use of natural gas was introduced into Morgantown, this coal was mined extensively and transported by wagon to many homes in Morgantown for heating purposes. The mine is so located that it has a natural drainage; the Pittsburgh sandstone (25 ft. or more in thickness) lying a few inches above the coal forms a substantial roof. The seam varies from 6 to 9 ft. in thickness.

The experiments here described were undertaken when I was employed as assistant horticulturist at the West Virginia University Agricultural Experiment Station. It was then I discovered that abandoned mines are well adapted to the growing of mushrooms. A large number of the rooms in mines have an even temperature the year round and in other respects are just right for growing mushrooms.

In selecting the places, get rooms not too wet. Do not lay beds on any floor that is liable to flood or places that have leakage or dripping overhead, and the room should have a temperature of about 55 deg. Next procure manure, which should never be any but fresh horse manure from stables where clean straw is used for bedding and horses have been grain-fed. Manure where hay or grass alone is fed seems to be of very little value to fertilize the ground in which mushrooms are grown.



A MUSHROOM BED IN ABANDONED WEST VIRGINIA COAL MINE

Having the right kind of material, the next step is to get it into condition to make up your beds. You should have a fair-sized pile of manure in order that it may heat sufficiently and properly compost. Get your manure as near as possible at one time and keep it in one large pile 3 to 5 ft. high. Then begin turning thoroughly;

---

*Morgantown, W. Va.

shake each forkful and keep putting outside manure in the center. I turned manure between 15 and 20 times.

Manure Should Be Turned

The reason for turning the manure so often is simply this: If it were used in a fresh state it would heat to such an extent, when made into beds, that it would burn. The chemicals which are contained in fresh horse manure must be reduced to some extent before they furnish just the proper nourishment for the growing of mushrooms. The manure is turned to reduce the heat so that the temperature can be controlled to moderate the chemicals and prevent the manure from later burning in the beds and running up a high temperature.

I maintained the proper amount of moisture by watering with a hose. Never allow manure to burn, or drown it by too much water. It was 20 days from the time I procured manure and began working it over until it was right to make up into beds. The straw was well broken up and had turned a dark brown while the manure was curing. In preparing the beds, do not make any of them less than 50 sq.ft.—the larger the better.

Face your beds with 12-in. boards set on edge; brace well so they do not move out when transferring the manure inside. Make the beds so you can reach over them without getting on them after mushrooms begin growing. Put manure in in layers; tramp each layer well with your feet, or if the room is too low use a heavy block 12 in. square and two or three inches thick, with handle. Fill each bed up to the top of the boards, always keeping the surface even when building up. In putting on the last layer of manure use short manure, which is raked up after long manure has been hauled in. It will give a more even surface and you will not have straws sticking up after the bed is completed.

Each bed should be fairly wet, but not soggy; if too dry, water it, but be careful to water uniformly all over. It is easier to water a bed the second time than to get it too wet, which would cause you to make it over. After the bed has been made two or three days, procure a good hotbed thermometer and stick it into the bed for a depth of four inches about every 10 ft. The thermometer will run up from 105 to 140 deg. Take the temperature every day until it goes down to 75 or 80 deg., which will be 18 or 20 days after you make up the beds.

After the Beds Are Ready

You are now ready to spawn, which should have been procured in advance from a reliable grower. Spawn should be as fresh as possible, but will keep six months if stored in a dry room at a temperature of 60 deg. If kept too moist it will start to grow spawn, or, to use the scientific name, mycelium, which corresponds to seed. There are two kinds of spawn—the English, called virgin spawn, and the American, called pure culture. I have always had best success from pure culture. It comes in bricks, which should be broken in six to eight pieces. Make holes in the bed 9 to 10 in. apart. I used a straight-pronged weeding fork with prongs 4 in. long. Make the holes on a slant. Put pieces of spawn in each hole, with end showing most life uppermost. It should be covered about one inch. Use brick or block to pound the manure back in place, always keeping the surface smooth and level. Watch the temperature and when it drops to 60 or 65 deg., which will take from 8 to 25 days, you will be ready for soiling, which consists of covering the bed with one inch of soil.

MUSHROOMS IN BASKETS CONTAINING ONE POUND EACH READY TO BE MARKETED

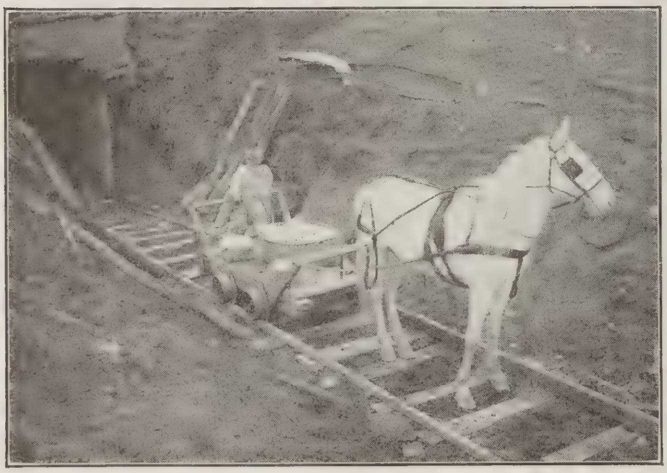
Putting Soil on the Beds

I used soil that had been composted for putting plants in greenhouses on about half of my beds, and on the rest ordinary garden soil, and the results were the same. Have soil moist, but not wet or sticky. Do not use a clay soil, as it will bake and crack on the beds. The soil should be screened to take out rocks and lumps. Use your pounder again to level the soil and get an even surface. If your bed becomes dry, water very lightly with fine spray or mist. I used a fruit spray pump for all watering after the beds were made up. Have the temperature of the water about 70 deg. Never drown the bed, but keep the walk moist and you will need but little water. My first mushrooms appeared in 39 days after spawning, and were in full bearing 26 days later, and continued to bear for three months.

From the time the beds be in to bear, go over them each day, gathering the mushrooms that are ready to pick. The best way to tell when they are ready is by picking all those where the frill connecting the cap or top has separated from the stem; or, better yet, just before this separation takes place. This makes the mushrooms better "keepers" and "shippers," for if they are picked when they are quite open or flat the under surface turns black quickly and makes them less desirable for the market.

It is the general impression that a mushroom springs up overnight. Just why this opinion has been formed I cannot say. There is really no reason why a mushroom should grow or develop more at night than during the daytime. The wild ones are usually gathered during the cool of the morning, before the warm weather affects them. This may be one reason why the impression is formed that they grow up overnight.

In cultivating mushrooms the conditions are also very different. The temperature and moisture conditions are more even, and I would say that under ordinary conditions it would take from two days to a week for a mushroom to develop after it has grown above the ground. By this I mean that it takes somewhat longer for a large mushroom to reach its full growth than it does for a small one. Do not pull your mushrooms up or cut them off. In pulling them up you will surely disturb the roots or mycelium of those growing near the one gathered or those which as yet have not come up.



MR. IMBACH'S SON HAULING MUSHROOMS FROM MINE WITH HIS PONY

If you were to cut them off you would leave a stump which would decay and have a tendency to spoil the entire bed.

How to Gather Mushrooms

If the mushroom, which is ready to pick, is growing by itself, take hold of it by the cap and with a little twist separate it from the roots, while if it is in a clump with others not yet ready, hold the clump with one hand and twist out the one to be gathered. It is well to go over the beds every few days and with a little fresh soil fill the holes left by taking out the mushrooms, and at the same time remove any that show signs of decay by being disturbed. This will keep your beds clean and preserve an even surface.

The best way to gather your crop is to have two baskets, and as you twist out the mushrooms cut off the lower part of the stem with the root attached and put it in one basket and the mushroom into the other. In this way the dirt adhering to the root will not be sprinkled over the mushrooms and they can be put on the packing table clean and free from dirt, while the stems and roots can be thrown out of doors and not in the paths, as I have seen done by careless growers.

Mushrooms were formerly marketed in baskets, but an attractive package helps to sell any article of food. A clean, white pasteboard box that will hold just a pound, I have found to be the best. Put your mushrooms on the market as soon after picking as possible. They will keep for two or three days, and they stand shipping well, as they do not break easily and need very little protection from the cold. They also retain in themselves a certain amount of heat, making them easy to handle even during cold weather. For local markets I used one- and two-quart berry boxes, which hold one and two pounds each.

My mushrooms were all graded, and I have found that it pays to separate them, putting the large, firm and perfect ones in one grade and the smaller ones, or button mushrooms, in another grade; and if by chance some have been overlooked in picking and become flat or open, I would advise putting them by themselves so as to keep the "number ones" and the "buttons" perfect.

A Ready Market

Some people, who do not doubt but that they can grow mushrooms, fear that they will not be able to sell them. Such fears, however, are entirely groundless, for the demand is increasing yearly, and the fact that I received higher prices for mushrooms during late years than I did in any of the years previous is very good evidence that the demand is growing faster than the supply. In every community there are plenty of people who will gladly buy all you can raise, but who have been unable to get them, as the bulk of all the mushrooms grown in this country has so far been sent to a few large cities. In every city of any size you will find a good market for your crop; and if you will take the matter up with any commission man who deals in vegetables and fruits, he will be glad to handle all you can send him; and the same is true of large hotels and restaurants.

The essential things are good manure, fresh spawn and a good man. Never attempt to grow mushrooms with a careless man.

⁂

Motor Trucks Enlarge Available Territory of Retailers

On account of the extensive area of the city, the Philadelphia dealers are rapidly adopting the motor vehicle in order to facilitate deliveries. This increased use of the motor truck has brought about a peculiar condition. One large dealer who uses this method of delivery states that he does not know who his competitors are these days because dealers from far and wide are coming into his territory and seeking his trade.

Owing to the condition of the retail market no order is refused on account of a long haul. This is expected to adjust itself with the arrival of the busy days of fall and winter.

Storage of Powdered Coal

By Edward J. Kelly*

Coal storage has become an important problem in modern industrial life because of the possible occurrence of sudden fluctuations in the market conditions and labor troubles at the mines or with transportation companies. Anthracite offers practically no difficulty in the way of storage, as it is almost unaffected by weather conditions and it will not ignite spontaneously. Bituminous coals, however, when stored, disintegrate and are in great danger of spontaneous ignition.

This is due to an absorption of oxygen from the atmosphere by the coal itself. If the heat resulting from this reaction can be dissipated, no harm results; otherwise the temperature of the coal rises until the temperature of ignition is reached. The area of the surface exposed is a determining factor, and since this surface area is increased as the size of the particles is decreased, we can readily imagine the importance of this when applied to powdered coal.

Dennstedt and Schaper in *Zangew. Chem.*, 25, 2625-9, show that the greater the percentage of oxygen in the coal, the more liable it is to ignite spontaneously.

Porter and Taylor in *J. Ind. Eng. Chem.* 5, 292, state that "the development of heat on moistening dry coal . . . may contribute appreciably to the spontaneous heating of some coals in storage."

These opinions indicate two factors in the spontaneous ignition of powdered coal—the presence of oxygen and other occluded gases and the presence of moisture. Other causes of self-ignition are: 1. Pressure on the coal. 2. Presence of iron pyrites. 3. Volatile matter in the coal itself. 4. Temperature.

The effect of pressure is to increase the temperature of the pile of coal, and it varies as the height of the pile. It is suggested that the pile should never exceed a height of 12 ft.

The effect of iron pyrites is rather doubtful, as coals containing negligible quantities of this compound have been known to ignite spontaneously.

Coals which are fairly high in volatile matter are more subject to self-ignition. This has been fully borne out by the findings of Messrs. Tessenden and Wharton (*Bull. Univ. of Mo. Eng. Series,* Vol. 1, 1908).

The effect of temperature is considered by many authorities to be one of the important factors in spontaneous combustion, because the oxidation proceeds more rapidly as the temperature of the coal increases. Heat from the sun's rays may even be dangerous, an instance of this kind having occurred in the surface works of the Mayback colliery at Friedrichstahl, Germany. Floating coal dust deposited on some of the iron girders in layers of an inch or more, and was burned to a white ash when the girders became heated by the sun.

The following precautions should be observed in storing powdered coal: 1. Limit the height of the coal pile to 10 or 12 ft. 2. Isolate the coal from all sources of heat such as steam pipes, flues, reflecting surfaces and direct sunlight.

In regard to the conditions of storage, two different methods may be cited: 1. Storing in piles in the open air. 2. Storing in covered bins.

There seems to be very little to choose between these methods, save that all other things being equal, the covered bin would protect the coal from direct sunlight, which was shown to be a contributing factor in spontaneous ignition. If covered bins are used, added overhead charges will be entailed, while open storage on the other hand gives low costs.

I have been informed of a novel storage bin constructed for a firm in Maine. This bin contained several rows of upright beams. Saw-tooth projections were built on two sides of each upright, thereby forming air-spaces, which led into the main flue, the latter extending from the bottom of the bin to the top. When the bin was filled with coal, the heat generated and the gases given off escaped through the flues to the top of the bin and out into the air. It is perfectly obvious, however, that should the coal in the bin become ignited by any chance, the flues would produce a draft and so increase the rapidity of the combustion.

Bins should be constructed of stone, brick or concrete; if iron work has entered into the construction, it should be covered with concrete.

Alberta Law Regulating Plans

A new law was passed in Alberta Province, Canada, by order-in-council June 8, 1915, being a regulation under sec. 138 of the Mines Act, regarding plans. The new law is known as Order No. 4 and took effect July 1, 1915. It requires that all plans kept in accordance with the provisions of the Mines Act shall be made of durable material and prepared by or under the supervision of a person holding a certificate as mine surveyor granted under the Mines Act. The law prohibits any person not so qualified from preparing such a plan, although it permits the preparation of a plan by such person when acting under the supervision of one who has qualified.

The law further provides that any applicant for such certificate must satisfy the board of examiners in regard to the following points: 1. The applicant must have had at least two years' practical experience in the surveying of mines, or must hold a diploma in scientific and mining training obtained after a course of study of at least two years at an educational institute approved by the Minister of Mines, or have taken a degree in scientific and mining subjects at a university so approved. 2. The applicant must be competent (a) to make an accurate survey of the workings of a coal mine and to connect the same with a surface survey, (b) to make accurate levelings, (c) to plot accurately surveys and levelings; (d) the applicant must produce evidence of sobriety and general good conduct.

The law further provides that where the workings of a mine have approached within 2000 ft. of any borehole drilled for the purpose of developing natural gas or oil the owner, agent or manager of the mine shall keep in the office a correct plan of the mine drawn to the required scale and showing the position of said borehole in relation to the mine workings and the projected workings. A copy of this plan must be forwarded to the chief inspector of mines not later than Jan. 31 each year.

Each plan required by the Mines Act must bear the date of the last survey and the signature of the person making such survey or the signature of the certificated person under whose supervision the work has been done.

New Byproduct Coke Ovens in England

The Ebbw Vale Steel, Iron & Coal Co., Ltd., in Monmouthshire, England, has opened a modern plant for the production of 4000 tons of coke per week and the recovery of byproducts, which have hitherto been largely neglected in the district, says Consul L. A. Lathrop in *Commerce Reports*. The ovens are on the direct recovery system and were erected by the patentees, Messrs. Koppers, of Sheffield, England.

With the quality of coal mined by the company, it is expected to produce an excess of 9000 cu.ft. of gas per long ton of coal, from 5 to 6 gal. of tar, 20 lb. of sulphate of ammonia and from 15 to 16 cwt. (1 cwt. = 112 lb.) of coke. Further extensions of the plant will be made to recover benzol and toluol.

Extracts from a Superintendent's Diary

Every once in a while I am given opportunity to reap rich rewards in exchange for the prestige that is supposed to attach to my signature.

It may be a real-estate broker disposing of town lots or an insurance solicitor selling stock as well as policies in a new company, or a solicitor getting charter members for a burial association, or a wildcat bank, or what not—the programme is always the same. First they approach me and attempt to interest me in their scheme by presenting it strictly on its merits; failing in this, they drop vague hints about the possibility of my getting in on the ground floor; and still getting no encouragement, they throw caution to the winds and offer to take me in in payment for my influence.

Fortunately for my peace of mind, I had my eye-teeth cut early in my career and the most loquacious solicitor cannot interest me if there is the slightest suspicion of his having singled me out because of my position.

Today, however, a solicitor got an interview with me, and he did it in spite of the fact that he let it be known from the start that he wanted my influence. Probably the very fact of his giving me warning in advance aroused my curiosity to a point where I could not send him away without finding out what he looked like and what he was up to. At any rate, he got into my office under circumstances so favorable to his mission that he was half way through with his plea before I had a chance to put in a word.

He was selling stereoscopes—just plain old-time stereoscopes that had such a vogue years ago before phonographs and moving pictures came into being to crowd out all other forms of amusement; so long ago, in fact, that I had entirely forgotten that such an instrument ever had an existence. The sight of it brought a smile to my lips, which was probably just what he most desired, for his countenance immediately took on an expression which seemed to say, "I've got him going."

For use with his stereoscope he had two distinct series of pictures. One series was got up to illustrate the importance of the science of sanitation as applied to the home, the village, and the city. It went into all of the details and pictured in the clearest manner imaginable the results of the very latest investigations.

When he asked me what I thought about them, I had to acknowledge that they were of great value. "Well, just give me an order for a set and I'll have every family in your camp following your example. It will be the best lead you ever made," was the way he expressed it.

Seeing that I hesitated, he brought out the second series. It dealt with domestic science—showed the different kinds of foods and how to prepare them, also the effects of depending upon poorly prepared foods. My wife takes an interest in such matters and gives the women of our camp the benefit of her knowledge, but I am sure that even she could have got many new ideas from the pictures.

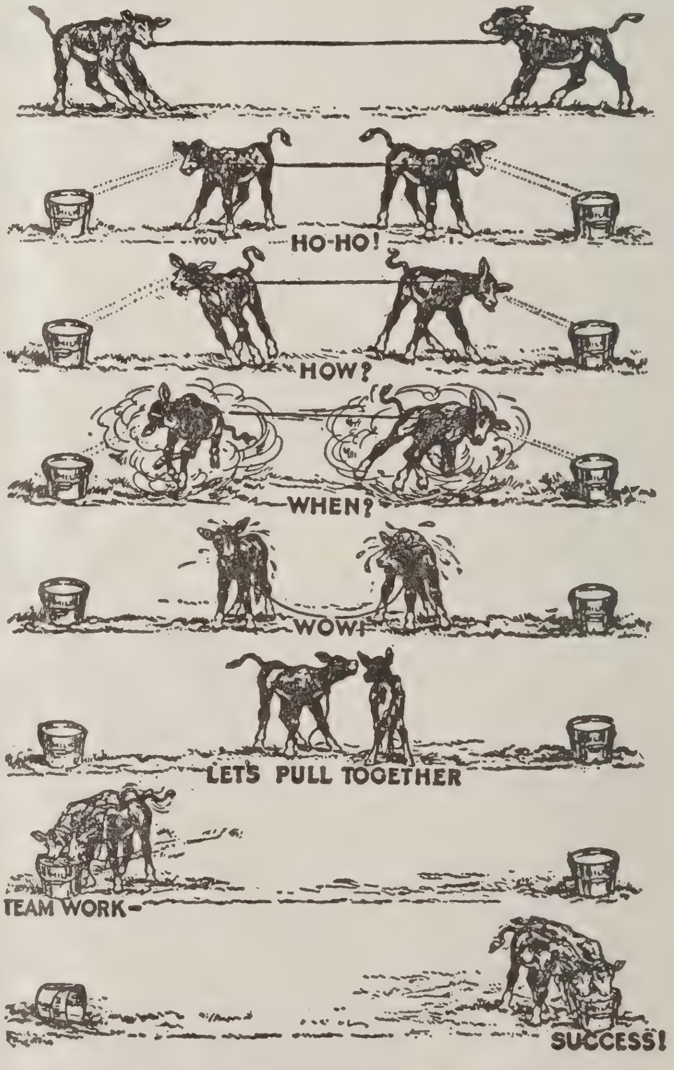
Again I was assured that it all hinged on my decision.

I didn't put my name on his order book, but I am not sure now that I acted wisely in refusing to donate my influence in his behalf.

Teamwork

The accompanying sketch was used effectively by the *Santa Fé Employees' Magazine* to explain the wisdom of coöperation and teamwork.

Not only does it show that teamwork means success for everyone involved, but it depicts the tremendous amount of labor wasted through what might be termed bull-headed, unreasoning selfishness.



YOU
HO-HO!
HOW?
WHEN?
WOW!
LET'S PULL TOGETHER
TEAM WORK-
SUCCESS!

Teamwork not only means the accomplishment of a given aim, but it permits ease of operation to such an extent that maximum results are attained with a minimum of effort.

Chief Inspector of Mines, British Columbia

Having noted recent references in the Canadian press relating to certain allegations emanating from labor organizations and reflecting on the ability and integrity of Thomas Graham, chief inspector of mines in the Province of British Columbia, it gives *Coal Age* great pleasure to add its endorsement of the sterling worth and character of Mr. Graham. What we have to say is wholly unsolicited, and offered as a free commentary on the observed acts and ability of the man who has filled the office of chief mine inspector for the Canadian Province with success for more than three years.

An intimate acquaintance of twelve years with Mr. Graham permits the editor of *Coal Age* to give first-hand testimony regarding his mining ability and mature judgment. Any attempt to discredit either the work or the ability of Mr. Graham can only reflect on the honesty and candor of the instigators. It would have no effect on those acquainted with the present incumbent of the office of the chief inspector of mines in British Columbia.

※

Another Portable Electric Cap Lamp Approved

The Bureau of Mines, on July 16, 1915, approved for safety and for practicability and efficiency in general service the miners' portable electric lamp known as the Manlite No. 8 lamp, manufactured by the Mannesmann Light Co. of America, 331 Fourth Ave., New York City. Approval No. 11 has been issued to this company.

The only bulbs so far approved for use with these lamps are the bulbs identified by the symbol "C-5," manufactured by the Mannesmann Light Co. of America.

This lamp will be distinguished by a plate bearing the seal of the Bureau of Mines, Approval No. 11, and other information relative to the approval.

※

The American Mine Safety Association at An End

At a meeting of the American Mine Safety Association held at Sewickley, Penn., it was decided to accept the generous offer of the National Safety Council and to amalgamate with that body as the Mining Section. The vote was not heavy, because most of the members hardly knew what was the best action to take under the circumstances. Only 64 votes were cast, but only one was against the amalgamation.

Twelve votes were cast by large mining companies—a most significant action, as by the rule of the National Safety Council these larger organizations will have to pay more than those that are smaller. Companies with over 10,000 employees pay $100 per year and those with only 100 escape with only $10 of yearly dues. This fact was plainly set forth when the vote was taken, so that everyone clearly understood the situation.

The vote of these large corporations in favor of union is an evidence that they are willing to pay the increased rates demanded by the National Safety Council. This shows a generous appreciation of their part in the work. Some corporations have been willing to avail themselves of the services of the A. M. S. A. without any payment whatsoever. They have not even taken out individual memberships at $3 a year for their general managers. Others have declared themselves willing to pay for the medals awarded but not for the expenses of the organization awarding the medals, despite the fact that the officials of the association were entirely unpaid.

It is probable that with the National Safety Council in charge the proposition will be put on a more solid basis and one more worthy of the excellence of the work performed and more readily appealing to public support.

The Manager's Vacation Days

By Walt Mason

(Written expressly for "Coal Age.")

In summertime the weary clerks break loose from the accustomed works, and take a well-earned rest; the janitor lets duties skip, and packs his grip and takes a trip to some place east or west. And e'en the freckled office boy deserts his post, with shrieks of joy, and scampers to the woods; for it occurs to all who toil that when the days of August broil, vacations are the goods.

But there is one who oft remains on duty, wearing nerves and brains, while others have their fun; the boss, who needs a layoff most, is toiling, toiling at his post, as constant as the sun. It would be better far for him, it would renew his strength and vim, if he would quit the grind, if he would drop his business chores, and chase himself around outdoors, and leave his cares behind.

The time invested in a rest is time invested for the best, for men who always toil, do so at sacrifice of power; their nerves get frayed, their tempers sour and sorer than a boil. So for a little while forget the business with its care and fret, and be a youth once more; go fishing with a good long pole, take headers in the swimming-hole, slide down the cellar door.

A tonic it will prove to you; vitality it will renew, your grouch it will destroy; and when from woodlands picturesque you go back to your chair or desk, you'll find your work a joy. You have to take a rest at night, when in your bed you slumber tight, and snore some ragtime tunes; and if you knew not that repose, your usefulness full soon would close, your surname would be Prunes.

And if a little rest is good, a longer one, in field or wood, by grove or burbling stream, will help you as it helps your clerk, and brace you up and make your work no more a nightmare seem. So, Mr. Manager, be wise, get out and gambol 'neath the skies, and canter like a colt; get clear away from every care that brings the silver to your hair, from business jar and jolt. And take along to brook or glade the helpful paper of your trade, while you are resting there; thus you'll improve the leisure day, and drive all loneliness away, and have some truths to spare.

COMING MEETINGS

The United First-Aid Corps of the 4th district, Delaware, Lackawanna & Western R.R. Co.'s coal department, will hold its third annual first-aid contest at Harveys Lake, Penn., on Aug. 14, 1915. Lewis Richards, secretary, 212 East Green St., Nanticoke, Penn.

The National Commissary Managers' Association will hold its sixth annual convention at the Hotel Gibson, Cincinnati, Ohio, Aug. 24-26, 1915. Tracy D. Luccock, secretary, 801 Manhattan Bldg., Chicago, Ill.

The Somerset County Miners' First-Aid Meet will be held at Boswell, Penn., Sept. 4. The head of the local committee is F. W. Cunningham, Somerset, Penn.

American Institute of Mining Engineers will hold its 111th meeting at San Francisco, Calif., Sept. 16-18. Bradley Stoughton, secretary, 29 West 39th St., New York City.

The American Mining Congress will hold its 18th annual session at the Exposition Memorial Auditorium, San Francisco, Calif., Sept. 20-22, 1915. J. F. Callbreath, secretary, Majestic Bldg., Denver, Colo.

The United Mine Workers of America will hold its annual convention in St. Louis, Mo., beginning Jan. 17 and continuing for three weeks. William Green, secretary-treasurer, 1102-1109 Merchants National Bank Bldg., Indianapolis, Ind.

The Labor Situation

SYNOPSIS—The scale committee in the anthracite district No. 1 has demanded the 8-hr. day, recognition of the union, a 25-per cent. increase in all day and contract wage rates, regardless of change in length of day, and also large allowances for overtime and holiday-time work. The Ohio miners are partly on strike and partly idle, and nearly all are destitute. The South Wales agreement is accepted by the miners.

The following is the report of the scale committee of district No. 1 of the United Mine Workers of America to the biennial convention, meeting in Scranton, Penn. The wording has been slightly changed, the principal modification being the omission of the unmannerly words "we demand" with which each clause opens with monotonous bad taste. We had occasion some time ago to publish an article by Milton H. Fies condemning the lack of manners in the operators' notices published around mining plants and recommending a more friendly manner of address.

The miners have no cause for complaint. They are no less arbitrary in writing their requirements. It is sure that it was not necessary for the miners to put "we demand" 21 times in a short document. They could have made their statement just as satisfactorily with the expression entirely left out, as in the abridgment we publish.

Scranton, Penn., July 19, 1915.

To the delegates of the first biennial convention: We, your scale committee, having examined all requests for an improved contract, submit for your approval the following demands:

1. Recognition of our organization with the right to negotiate a wage contract and to provide a satisfactory method for the collection of revenue for the organization.

2. An 8-hr. day for all men and boys employed in or around any colliery with no reduction in pay.

A New Conciliation Board Demanded

3. The Conciliation Board shall be abolished and the following method substituted for the adjustment of disputes: The employees of each mine through their grievance committee may form a general grievance committee, and the said committee shall appoint a subcommittee. Its duty shall be to carry on negotiations with representatives of the organization and officials of the company and try to arrive at a satisfactory agreement on any dispute which affects the employees in general. It shall also act in disagreements between the mine committee and the company officials, regarding new work or changed conditions, etc. Any agreement made by the subcommittee shall be effective and binding, and shall apply to all the employees working for that company.

All such agreements shall be made in writing, and signed by the officials of the company, the subcommittee and the representatives of the organization in behalf of the employees.

In case the subcommittee and the officials of the organization and company officials fail to come to an agreement on the dispute involved, the officials of the organization are to choose one man not interested in the dispute to arbitrate it. He shall hear all evidence, after which he shall make his decision within 30 days after the time at which it was decided that the organization officials and the representatives of the company had failed to reach a decision.

The said decision shall be final and binding on both parties to the controversy. The expense incurred shall be equally divided between the coal company and the mine workers. The expenses of the latter shall be paid by the district treasurer out of the funds of the district where the dispute arises.

4. An advance of 25 per cent. shall be made on all the rates now paid for day work. An increase of 25 per cent. shall be granted all contract miners and laborers.

5. Not more than two laborers shall be permitted to work under the care of any one miner.

6. Coal shall be weighed on the run-of-mine basis, 2240 lb. constituting a ton.

7. A uniform day at not less than $4 per day shall be granted machine runners and $3.50 per day shall be the rate for helpers.

8. Men in charge of a timbering, rockwork, or other like gang shall be paid the consideration miners' rate; helper rates less than consideration of laborers' rate paid at the mines where this work is performed. [The real nature of this demand is not clear.]

9. The price of coal sold to employees shall not be increased during the life of the agreement. The price to be paid shall be specified when this contract is made.

10. Time and a half for all overtime and double time for Sunday work and holidays shall be conceded.

11. No employees shall be suspended or discharged until their suspension or dismissal has been considered. Such action shall be subject to revision similar to that accorded to any action under this contract.

12. A minimum rate for slate pickers shall be $1.25; any advance received under this agreement shall be added thereto.

13. The manner in which mining machines shall be used shall be properly regulated, and a scale of wage rates for machine mining shall be granted, which shall be adjusted to the various systems of handling machine coal now in use in the anthracite region.

14. The contract system shall be abolished in the anthracite region, and all contracts now in effect shall be declared null and void after the signing of the new agreement.

15. A minimum rate of $2.50 per 8-hr. day shall be paid to firemen, and the compensation to carpenters and blacksmiths shall be 47½c. per hr. To these rates should be added whatever general increase of wage other mine workers shall receive.

16. The next agreement shall be made for a period of two years.

Men Are To Be Paid for All the Props They Set

17. Payment shall be made for standing props on second mining.

18. Where three engineers are employed the third shall receive the same pay as the first two.

19. A payment of 10c. per ft. shall be made for the standing of all props on first mining.

20. Where the pitch does not exceed 30 deg., chambers shall not be driven more than 150 ft. long before being cut off by counter gangways. Where this cannot be done a payment of 20c. per car shall be made for the first 100 ft. from the platform, and 20c. extra shall be paid for every 50 ft. driven above the 50-ft. (?) mark. The same rule shall apply to buggy places.

21. No agreement shall be binding until first submitted to the local union for a referendum vote.

An Evident Expectation To Dicker Is Revealed

Despite the peremptory character of the demands, it is noticeable that there is a certain weakening about the wage concession, because a minimum is set for several workers and provision is made for these men receiving an equal increase with the other mine workers, whatever that may be.

There is, of course, no question but what the demand of the committee is merely a basis for dickering. The miners have not yet learned that they should ask for what they think they have a right to get and stick to it.

President John P. White is opposed to the recommendation which the scale committee has made relative to arbitration. He would like to see all matters brought before a single board for consideration, so that some uniformity would be obtained. He feels that otherwise local conditions may cause agreements to be made which will prejudice settlements in other districts where the conditions are slightly different.

The convention adopted a resolution which originated in local union No. 1649, which not only demands a fair compensation for machine mining, but charges that the operators have been driving the machine men to superhuman efforts in order that they might produce a large tonnage of coal which would serve to establish a basis which would be too high to be a fair criterion of what would constitute a day's work.

The miners, recognizing that there is a powerful press committee influencing the public in favor of the contentions of the operator, have decided to form a press bureau themselves. This committee will be named in each section and will distribute material to the papers and will provide matter for the "United Mine Worker's Journal."

Miners Object to Compensation Law

Not a little complaint was made at the convention about the Workmen's Compensation Law on the ground that a man who is injured so that he cannot work is not half but wholly incapacitated and should receive not merely half pay but 100 per cent. In fact, it is true, he has to meet, on the whole, expenses which make it necessary for him to receive more pay rather than less in order to live as well as before.

Though he has nothing to pay for oil, carbide and powder, he has to meet in some cases doctor's, nurse's and druggist's bills, although in many instances part of these, for a while at least, is provided by the monthly payment to the doctor. The argument on the opposing side is, of course, that the miner should coinsure, so that he will not be anxious to claim help from the industry after he is fit to go back to work. Some miners, like some richer men who have insurance, are not prone to go to work if they can make as much by sitting at home.

The attorney for the Pennsylvania miners, defending his work in securing the passage of the law, declared: "You have the grandest employers' liability law ever written because it destroys two of the old common-law defenses—the fellow-servant rule and that of assumption of risk, and modifies a third, contributory negligence." The miners desire old-age mothers' pensions in addition to a more generous workmen's compensation law.

"Mild Request" for Replacing of Wood Rails

The Delaware & Hudson Co. was severely criticized in the convention at different times by the Eddy Creek local at Oliphant and by the Peckville miners. But more serious because more general was the complaint about room trackage. The miners want the wooden tracks alleged to be used in chambers of that company replaced by "iron rails." Certainly the miners in this present day have a right to have steel tracks in their rooms.

There is no profit to any company in using wood rails, as they have a short life and warp so freely that numbers have to be thrown out. The frequent derailments in the rooms prevent certainty in operation and are the cause of much lost time in the haulageways. It is quite likely, therefore, that if conditions prove as stated the men will get what they desire, and they cannot be blamed for their urgency in making their complaints. The resolution with commendable restraint calls for a "mild request" for steel rails.

Among other matters considered was the pay of presidents, secretaries, treasurers and district-board members. It is expected that the president's salary will be raised from $1600 to $2000 a year, the secretary-treasurer's from $1300 to $1500 and the district-board members will receive $4 instead of $3.85 a day.

There has been some opposition to the use of buttons as visible receipts of union dues, as they can be handed around among the men in a boarding-house. It has been decided that the regular district button must be used or none at all. Local unions cannot provide their own distinctive buttons.

The convention rejected a plan to set aside a "lockout fund" for the benefit of those who were temporarily discharged by coal companies or made idle by the closing of mines. It was suggested that 3c. out of every monthly per capita tax be used to establish this fund. The miners hope, however, to make the operators pay for idleness caused in this way and will not establish a fund for that purpose.

To Avoid Something Analogous to Colonization

The election for district officers has been bitterly contested, and many have been the charges of fraud. It has been alleged that a West Scranton local union purposely increased its contribution to union funds so as to obtain an excessive vote. In order to block such possible dishonesty, the rule relating to elections was made to read: "The tellers shall not count the votes of any union that has cast more votes than the number of members for which such local paid per capita tax to the district union for the three months preceding that in which the election is held. The local union shall send notice, upon uniform sheets supplied by the district, of all new members initiated during these months."

It is alleged that the vote of Local 2444 was illegal because the union was in arrears, that Local 1635 turned in 167 votes, although only 9 members voted, while Local 1068, where only 8 members voted, was registered by the union solidly for the administration. Other examples quoted are these: Local 1001 cast 72 votes and the returns show 521. Local 957 cast 402 votes for Thomas Hilton as executive-board member and 6 for his opponent, Peter O'Donnell. The tellers' report neatly reversed the figures in O'Donnell's favor. The vote was close for this office, for O'Donnell received 6737 and Hilton 5842.

The Votes in District No. 1 Show Dempsey President

John T. Dempsey, of Scranton, is reëlected president with 20,666 votes, beating Thomas Morris, of Edwardsville, who received only 11,081. Joseph Yannis, of Pittston, who faced as many as five rivals, easily won as vice-president with only 12,232 votes. John M. Mack, with 21,246½ votes, beat his only rival, Enoch Williams, of Taylor, who polled only 996½ votes. He was running for the secretary-treasurership. Thomas Davis, of Nanticoke, again becomes international-board member, more than doubling, with his 20,737 votes, the vote given to his rival, George Brown, of Scranton.

John P. White is receiving an enthusiastic welcome in the anthracite region, though his success in securing members has yet to be proved. He has issued a striking statement on the recent financial record of the Delaware, Lackawanna & Western R.R. Co.'s Coal Department, which a few days ago declared a deferred dividend of 60 per cent.

He declares in his statement that dividends totaling 140 per cent. have been paid in 6 years, that on a capital stock of $5,590,000 dividends of $9,226,000 have been paid, "which gives to the stockholders the return of their original investment and $2,636,000 in addition. The stock is still theirs, and it is conceded by all that the holdings of the company, without considering the increased valuation accruing from the large dividends paid, has greatly increased in value. The fact is the Delaware, Lackawanna & Western has outdistanced all other operating companies in building for future opportunities."

As Mr. White here suggests, the Delaware, Lackawanna & Western R.R. Co.'s Coal Department has an advantage over nearly all the other coal companies, for their affairs are by no means so prosperous. He has taken the "Henry Ford" company of them all. But he does not stop at this point; he goes on to show what this means to each employee.

If the Lackawanna Dividends Had Gone to the Employees

There are 19,056 of these men, and if the surplus over 10 per cent. per annum had been paid them, each individual would have received $45.23 per year more, and each man or boy would have been paid 19c. more per day. All this could have been done without disturbing the surplus of $1,500,000. This 19c. per day, he declares, would have been a 10 per cent. increase were all classes lumped together as a unit.

This richest company is taken as a guide to show what all the companies could do. The mine workers, however, are not satisfied with 10 per cent., but desire 25 per cent. of an increase and also for the day men a decrease of time of 11 per cent. It is remarkable how the argument breaks down at this point.

Mr. White would have the poor educated as well as the rich, and pleads eloquently for it. That alone is not by any means impossible, but when poor and rich share alike no one will experience any great degree of affluence, for, as has been shown, the income above 10 per cent. of the best anthracite company would only give 19c. per day per man if divided and the whole income for 6 years not more than 33c. Dividends grow small when divided among the multitude.

But though John P. White makes a somewhat biased statement about the Delaware, Lackawanna & Western R.R. and other anthracite companies, he is not lacking in the gentle amenities of life. And in their turn the companies are not being ungenerous. At Edwardsville the Kingston Coal Co., one of the independents, without charge furnished the current and paid the electricians to wire the field when Mr. White came to that town to promote the interests of the union.

Are Not the Miners in Eastern Ohio Justified?

About 1000 miners are on strike in eastern Ohio, and there has been a disposition to blame them. The public remembers that within the last two years they have been on strike for 13 months and business has been so bad that only a few of them have gone back to work. On its face, this public disapproval seems to be merited, but the miners are not without reasonable excuse. In fact they are showing an excellent disposition in the matter.

Though it is not in the contract, the operators are said to have agreed that by July 22 they would install mine scales, so as to weigh the coal as it came from the mine. This gave them over 60 days to do the work for the contract dates from May 11. Only about 10 places out of 69 have made the necessary changes and some of the mines are said to have made no attempt to do so. This statement has been made of Pultney No. 1, Fort Pitt, the Webb, the Bakewell, the Neff and the Franklin mine. Scales are already installed at Rail & River No. 1, and they are being erected at Rail & River Nos. 2 and 6.

C. J. Albasin, the president of subdistrict No. 5, which covers eastern Ohio, declares that where attempts are being made to secure and install scales, the union is endeavoring to keep the men at work and is extending the time for the necessary changes. The operators claim the scale makers are unable to fill the orders promptly. The Lorain Coal & Dock Co.'s mine at Blaine, the Herrick mine of the United States Coal Co. at Rush Run and the Cambria Mining Co. at Bellaire are closed down as a result of the lack of facilities for weighing coal as it comes from the mine.

It is stated by C. J. Albasin that during the recent strike $1,654,450 was paid out by the union for food, clothing and medicine. Of course, the miners also received direct contributions, and their losses are by no means adequately represented by the sum expended in their relief.

But with the closing of the mines in the Hocking district a further accession has been made to the sorrows of the Ohio miners, and on July 22 Governor Willis made an appeal for help for those in both the eastern and southern ends of the coal region. The Adjutant General, B. W. Hough, will distribute the relief.

The miners are convinced that it is not so much the Green bill and the contract calling for payment for all coal mined, whether large or small, which are paralyzing the industry. In fact, when the Gallagher amendment to the Green bill was being pressed the miners urged that its passage would make little or no change in the condition of the business, whereas the Vorhies bill for fair railroad rates was the measure most greatly to be desired. They are now urging that some West Virginia coal is traveling 200 miles for a freight rate of 85c., while some Ohio coal goes one-quarter as far, 50 miles, for 5c. less. The railroads contend as a reason, though they can hardly claim it as a conclusive argument, that the West Virginia coal in the case cited is delivered to them in trainload lots at Armitage and, therefore, there is no extra expense in assembling the cars from the mines.

The United Mine Workers of America, District 6, which covers the Hocking Valley district, has made complaint about this discrimination to the State Utilities Commission through George B. Okey, its attorney. All the 39 railroads operating in Ohio are the defendants.

Tom Lewis to Be Operators' Representative

It is rumored that T. L. Lewis, the former president of the United Mine Workers of America, is likely to succeed John Zelenka as secretary of the Ohio Coal Operators' Association. T. L. Lewis has for some time published a coal paper at Bridgeport, Ohio. He has been extremely active in the eastern Ohio strike and has taken a position not unpleasing to the operators and consequently has more or less offended the miners. But he is a strong advocate of the union and his ability as a speaker and organizer is unquestioned.

The High Compensation Rates in West Virginia

The union miners in the Kanawha district are combining with the operators in opposition to the flat premium rate of $2.25 fixed on the coal industry of West Virginia by the Workmen's Compensation Law. The miners claim their share will be $1 per capita. They feel that the Kanawha district should not pay for the deficit caused by explosions in other districts. Carried to its conclusions, this argument would lead to each mine paying for its own explosions. The distribution of the burden through the industry is what assures certainty in the operation of the compensation law.

Attempts Are Made to Organize Eastern Kentucky

The miners of the Continental Coal Corporation and the new Bell Jellico Coal Co. have gone back to work at the same schedule of wages as prevailed when they walked out. The Continental Coal Corporation has agreed to restore the 10 per cent. deducted from the wage scale, on Oct. 1 or sooner if conditions warrant it. The company agrees to sell goods from the commissary on a 16 per cent. profit and to make certain repairs on the men's homes.

A local union was organized and an attempt will unquestionably be made to introduce the organization of the United Mine Workers of America into that unorganized field. At other mines the men are expecting to organize shortly, and the employees of the Coleman Mining Co. and the Pioneer Mining Co. in the Straight Creek field expect to demand recognition. But the lack of funds is likely at present to prevent successful organization, and the action will probably be delayed till a period of prosperity succeeds the present depression.

Amalgamation with Western Federation of Miners

Frank Farrington, president of District No. 12 of the United Mine Workers of America, announces that plans are being considered, as provided at the Indianapolis convention, for the amalgamation of the Western Federation of Miners with the United Mine Workers of America. Committees of the two organizations are to confer July 27 at Butte, Mont. The Western Federation of Miners is now opposed by a rival union at Butte, which is stronger than the Federation, and the latter organization has been discredited everywhere and to "wish on" the U. M. W. of A. such an "Old Man of the Sea" would be a most unkindly act.

The Courts May Act in the Bache-Denman Case

"Coal Age" is informed that in Arkansas the federal court did not dismiss the case of the Bache-Denman Coal Co., but merely sustained a demurrer, filed by the defendant. The company will amend its complaint and feels that as revised it meets all the points which were raised against the plaintiff company in the demurrer of the defendant.

South Wales Strike at an End

The strike in South Wales was definitely ended on Wednesday, July 21, when the miners agreed to the terms accepted by their leaders on the previous day. Lloyd George made a rousing speech to his friends, the miners, on the preceding day and asked the men to make up for the lost time by "extraordinary efforts."

All through the South Wales dispute the Federation of Miners of the United Kingdom has stood for peace and arbitration. It is not clear why the Federation showed more patriotism than the South Wales mine workers, but this is possibly due to several causes, among others the fact that the war has come more closely home to the dwellers in Yorkshire and the North country, and because the English are less sensitive under restraint than the Welsh. It is certain that in Wales the talk about the use of the strike to stop the war has been most rife, and it has had not a little to do with the present unrest.

But in no part of the country is there less cause for striking, unless indeed high pay acts as an incentive to do so. The South Wales miners have been receiving higher pay than the miners in other sections, for owing to the comparative newness of the South Wales field and the excellence of its product its advance has been rapid and prices have been high, and in a large degree the miners have participated.

Miners Felt They Had a Valid Grievance

The miners' wages had increased since July 1, 1914. At that time they were 60 per cent. above the base established in 1879. Just a year later they were 77½ per cent. above that base or had been raised 10.9 per cent. Probably the increase was no more than the increase in cost of living. Perhaps, also, where some of the wage earners were in the trenches, those that remained had a larger burden to sustain. From this point of view it is hard to deny that they had a grievance that an arbitration board, such as was proposed, would have recognized.

Moreover, while the miners' rate of wages had increased nearly 11 per cent., the operators are receiving a far larger percentage increase. On July 1, 1914, the price of best Welsh small steam coal, f.o.b. Cardiff, was $2.67 per ton. A year later it was selling for from $4.75 to $4.87, an increase of from 77 to 82 per cent. No. 3 Rhondda, lump, has risen from $4.25 to $6.80, a rise of 60 per cent. The operators are entitled to a slightly higher raise in price than the miners, because of the large increase in the cost of props; but it would have shown greater patriotism had they declared that no matter what others did they would raise their prices not one penny higher than was necessary to maintain their regular profits.

During an international war is no time to be trying to become rich at the expense of one's countrymen and allies. Had prices been unchanged wages might have been kept down to the ruling figure without any evidence of injustice. It is hard when declaring the South Wales miners unpatriotic not to extend that aspersion to the operators, who should have known better.

The government is preparing to limit profits to an even dollar above pre-bellum prices. That is an increase of from 25 to 30 per cent., hardly more than the miners will now receive under the new arrangement.

What the Operators Plead in Extension

It is true that the rise in the price of the coal reserved for Admiralty use has not been as large as that of other coal, still that price has risen from $5.10 and $5.22 to $6.56, a rise of from 26 to 29 per cent. Moreover, the operator urges that the rise in price has not persisted all through the war. The prices were hardly any higher when the year commenced than six months before, and business had not been by any means good.

The operators are but human and the prospect of a 25-per cent. income tax may have spurred them on to enlarge their profits; and to their credit be it said, there have been some other concerns which, like the ocean freighters, have increased their prices not 70 but 200 per cent.

Moreover it is only by profits that the large costs of the war can be met. What is made and spent is gone forever. The profits can be seized by the government by taxation and made to serve the nation, but the money paid as wages will be spread so thin over a large area that the tax collector will be grasping at thin air. In fact, the British have long since ceased to tax anything the poor man consumes except beer, whiskey, tobacco, tea, coffee and currants and the exchequer derives all its income from profits in the form of income tax.

The miners claim with truth that the profits in the Welsh coal trade have always been ample, and they feel that there is no excuse for such large advances as have been made since the war.

Editorials

New Head for Mining Bureau

It is generally accepted as a good policy in modern business to seek men for high positions from employees who have rendered faithful and efficient service in minor capacities. Everyone knows that a man will work with better heart when there is hope of reaching the top in his chosen line of endeavor. The knowledge that such a policy or principle of selection exists will bring the best talent to a corporation and will retain this talent through years of earnest effort. What applies to an industrial concern applies equally to a Government bureau.

The coal-mining fraternity, in fact mining men everywhere, are hoping that in selecting someone to succeed Dr. Holmes as director of the U. S. Bureau of Mines President Wilson will choose a man qualified by service in the bureau, or through long experience in mining engineering work elsewhere.

The coal and metal industries will support a new director whole-heartedly if the man chosen is selected for his evident ability to serve efficiently as head of the mining bureau. The work so ably started and carried on by Dr. Holmes will be severely crippled if political pull constitutes the essential qualification in the matter of selection.

Mining men are anxious and we trust current reports of an abhorrent choice are unfounded.

Recent Anthracite Decisions

The recent court decisions relating to the anthracite companies should bring a feeling of relief to all concerned, for the reasons that are outlined at greater length on another page of this issue of *Coal Age*. These companies have never been intentional violators of the law and were only acting under the statutes of the State of Pennsylvania. So their acts were valid enough until the state laws under which they had operated were rendered void by the passage of a national act.

These continued suits have aroused the feeling of the general public against the coal companies. Much of this feeling was not by any means spontaneous, but has been created by irresponsible parties pandering to the petty prejudices of people who allow others to think for them.

We may now hope that the coal companies can go forward and attend strictly to business and may be able to show a profit to their stockholders which will be commensurate with the capital invested. Some of the anthracite companies have made fair profits; in fact, the returns to some of them have been quite large, but it can be safely asserted that they nowhere approach those made in a dozen other business enterprises in this country which return large dividends year after year without any comment from the people.

It seems to be a weakness of human nature to decry the cost of vital necessities, whatever the price may be, yet a man can make a fortune in an amusement enterprise by the simple device of doubling the price, with only a gentle murmur on the part of the public, which continues its patronage and forgets. The consumers will make an automobile manufacturer a millionaire several times over and be actually greedy to purchase his product, the only question as to price being whether they have it or not.

Let us hope that a new day with at least 6 per cent. sunshine is dawning for the coal man. He has had so many trials and tribulations that it won't take much to make him happy and contented.

A Memorial for Dr. Holmes

It seems to be the unanimous opinion of the personal friends of Dr. Holmes, late director of the U. S. Bureau of Mines, that there should be some permanent memorial for a man so big of heart, so earnest and efficient as he was. At a recent gathering of a large number of his friends two plans were suggested which seemed to meet general approval. The first was the erection of an appropriate monument at the grave in Rock Creek Cemetery, Washington; the second plan was that a memorial volume should be printed, the book to contain a sketch of Dr. Holmes' life, views of his work by a number of selected persons, resolutions of various societies and associations, and finally a number of writings and addresses by Dr. Holmes himself.

There is no doubt but that either of these plans would be widely supported by the great army of workers in the mining and metallurgical industries. Few men, especially in the coal mines, but have felt the beneficial effects of the work carried on by the Federal mining bureau since its inauguration under the direction of Dr. Holmes. All of these men would gladly contribute the small amounts needed from each individual for either of the memorials above referred to.

Coal Age would greatly appreciate expressions of opinion on this matter from those of its readers who have numbered themselves among the host of coal-mining people who have at one time or another associated or coöperated with Dr. Holmes in the advancement of the important work he undertook. Such suggestions as we receive are not necessarily intended for publication, but for the guidance of those of Dr. Holmes' friends who will assume the responsibility and initiate the movement for a fitting memorial to honor the man and perpetuate his work.

The United Mine Workers

The plea of Mr. Archbald for the recognition of the union in last week's issue has of course the right ring. It does seem right that the men should be represented, and because some of the leaders are irresponsible seems an inadequate reason for condemning the whole union.

But the operator who has no organization to take exception to his every move is naturally disposed to avoid raising such a spirit of unrest, for he knows that the genii of the bottle when freed is quite as apt to be unreasonable as to be fair. He may feel admirably friendly to all the purposes of the union and yet be greatly disinclined to risk the peace around his mine by permitting the establishment of the union.

He argues: "The men say I have frailties against which they must be protected. I probably have them, but so have they, and it is best for me to run my own business." And he is surely not wrong in viewing several of the miners' leaders, especially in grievance committees, as the very epitome of revolt.

It is strange how fortunate the union has been in its national leaders and how unfortunate it has been in selecting its more local officers. One would expect that the national leaders, being selected by men who cannot know them, would be chosen without judgment and would be entirely unworthy of their places of honor. On the other hand, the grievance committee, which is well known to all the voters, should represent the real spirit of the men and be composed of the most rational fellows. But that is rarely the case. The bigger leaders are more responsible than those in places of local prominence and are in most cases men of solid worth. But your grievance committee is ever a standing offense.

The same is true in the affairs of our country. We have good reason to be proud of our Presidents, but our state officers and city aldermen are often a burden grievous to be borne.

The U. M. W. of A. is not without its excellent qualities. Some one might without sophistry write a panegyric on its solidarity. It has steadily refused to make any choice between the various classes in its membership. Roadmen and miners, carpenters and motormen, doorboys and timbermen are alike recipients of its solicitude. Nor does it allow squabbles between them. The miner who is called off to put up a brattice is not reprimanded because he takes the place of an absent carpenter; the carpenter who sets a prop for a doorway does not start a strike of timbermen; the miner who bails a little water does not find himself scolded by the pumper. There is nothing in mining like the squabbles among the house builders or the fusses recently disturbing the Remington arms plant.

The union once well established is better than when partly organized. The first men who join are the soreheads whom nothing suits, who do not believe in the present order of things; many are of the belief that they should not have to work for a living. They are men who like to lead, and trouble is in the wind.

It is not strange then that when the companies are once committed to a 50-per cent. union they change their views. They want to deal with all their workingmen not with the soreheads only. They desire to meet a consensus, not a travesty, of opinion, and they begin to look forward to a time when every man will be in the union, when every man will attend meetings and vote and when the vote will go to the best man. They have the same ideals as should animate our political life.

The best thing about Mr. Archbald's article is the reference to the need for the open discussion of every labor problem. Some day the operator will be permitted to meet the union in council and argue his case. He will have a chance to face his men and tell his story. The future will find us all knowing something of the arguments of the other side and basing our attitude upon them. The miner and the operator now plot darkly and in silence, and they come together only in clashes.

The miners' leaders have been talking loudly about the present war. It is, they say, a crime of the chancelleries, and in some ways they may be right. But why do not the miners themselves abolish their chancelleries? Why do they deny the operator the right to state his arguments in union meetings? Why must he always meet only their leaders, their chancellors, and not the men themselves?

Perhaps, as has been said in condemning statesmen, the miners' leaders are partly right. If the *people* could have met and talked the matter over man to man the war would perhaps have never happened, and probably if the same had been done in disputes between employer and employee many a strike war would have been averted. But the military men in the one case and the labor leaders in the other would have been disappointed and their trade would have been ignored.

The popular will would have been supreme and the men would not have blindly followed courses which appealed to them merely because they never had heard the opposing point of view. When also the leaders no longer fear the whole truth the *United Mine Workers' Journal* will no longer be the painfully newsless and unfair sheet it now is, but will let real light in on the causes of conflict and paint a real picture in which all is not shadow.

⁂

When Opportunity Knocks

All of us have been told from the time of our early childhood that Opportunity knocks at every man's door at some time or other and that each individual must be ever alert and responsive to the call. The coal industry is a business of great magnitude. Several thousand intelligent and experienced men are required to fill the important positions connected with the production of coal. Right now a number of large operating companies are searching for men who are qualified to fill positions of trust and responsibility.

A few days ago the manager of one of the largest bituminous operations in America asked us to recommend a man qualified to report on a peculiar problem that arose in connection with the operation of one of its mines. We remembered that a certain superintendent had recently prepared a paper covering in a general way the problem that confronted the bituminous operator above mentioned. There was a quick exchange of telegrams, and the author of the article was engaged to investigate the conditions and report a remedy.

This case is not an isolated one, for similar requests come to us at frequent intervals. What we want to emphasize is the desirability and advisability of mining men writing detailed accounts of their experiences, for it is only through such dissemination of practical information that great advances in the art of mining can be brought about. There is no doubt that what benefits the coal industry as a whole benefits also every individual engaged therein. It is likewise true that the greatest reputations attained by mining men have had their beginning founded on early literary efforts, which have brought them more than a purely local renown and focused attention on their practical sense, experience and ability.

Sociological Department

Kansas City First-Aid Contest

SYNOPSIS—A meet of first-aid workers at Kansas City, Mo., in which the miners from five states and their union were the chief factors, was held on July 10. The winning team, which is that from Lehigh, Okla., will go to San Francisco to represent Oklahoma, Kansas, Iowa, Missouri, Arkansas and Texas. The good work of the mining teams has started the first-aid movement in factories and in the police department of Kansas City.

One of the bright spots in the character of Dr. J. A. Holmes, the recently deceased chief of the Bureau of Mines, was the breadth with which he discerned that the first-aid movement is not an interest solely of the operator and of the men he might delegate, but of all workingmen, individually and in association. As a result of his work and that of his associates —one of whom, W. D. Ryan, is a former labor leader—the miners and the union have taken up first-aid training and contests and in many places are doing the work as their own, but with the friendly coöperation of the operators.

This is emphatically constructive unionism and demonstrates the fact that the union is organized for the welfare of the miner rather than for the perdition of the operator.

A first-aid contest and mine-rescue demonstration was held at Kansas City, Mo., July 10, under the patronage of the Public Safety Commercial Club of Kansas City, the Southwestern Interstate Coal Operators Association, the United Mine Workers of America and the United States Bureau of Mines.

The meet was held in the convention hall at 8 p.m., and about 2500 persons attended. Perhaps no meet of this sort outside Pittsburgh has been witnessed by so many people.

The committee on arrangements included also E. M. Clendening, secretary of the Kansas City Commercial Club; M. F. Ryan, president of the Brotherhood of Carmen; John T. Smith, business agent of the Industrial Council of Kansas City, Mo., who also represented the Missouri branch of the American Federation of Labor, and E. R. Sweeney, vice-president and general manager of the Gray-Bryan-Sweeney Coal Co., a member of the operators' association and also an active member of the Commercial Club.

The doctors who examined the dressings and action of the teams were C. C. Nesselrode from Kansas City, Kan., across the Kansas River; B. H. Zwart, P. F. Bohn, M. J. Owens, R. M. Meade, R. M. Schauffler, Logan Clendening and F. J. Ridge, all of Kansas City, Mo.

Many Labor Leaders Present

To show the general interest in the meet a list of those participating from outside the city may well be recited: George McBride, state labor commissioner of Kansas from Topeka, Kan.; P. H. Waterman, vice-president of the Iowa Coal Operators Association; W. H. Rogers, president, and John Gray, secretary, of the United Mine Workers of Iowa; George Hill, chief inspector of Missouri; Grant Parker, president, and George Heppel, secretary, of the United Mine Workers of Missouri; A. W. Dickenson, superintendent of the Central Coal & Coke Co.; Joseph Fletcher, general manager of the Cherokee & Pittsburgh Coal Mining Co., of Pittsburg, Kan., and vice-president of the American Mine Safety Association; John Pellegrino, mine inspector of Kansas; Bernard Harrigan, president of the United Mine Workers of Kansas; George Richardson, assistant commissioner of the Coal Operators Association of Kansas, and D. C. McAlpine, of Lehigh, Okla. The large number of labor leaders present may be noted with satisfaction.

The event was primarily a contest in first-aid work among teams from five states—Arkansas, Iowa, Kansas, Missouri and Oklahoma. The winning team was to be awarded the honor of representing the district at a contest in San Francisco. When it was proposed to hold the meet in Kansas City members of the operators' association who were also members of the Commercial Club realized that the coöperation of that institution would assist the safety-first movement and give wider publicity to the first-aid work now being done at mines.

How Funds for Contest Were Raised

The project was put in the hands of the Public Safety Committee of the club, and W. T. Grant, who is secretary of the Business Men's Accident Association of America, was made general chairman. The committee sold the manufacturers about 100 boxes in the convention hall and thus raised funds for the event. The manufacturers either used the box seats themselves or gave them to employees. About 10,000 tickets of admission were distributed by the committee among industrial employers, chiefly as formal notices of the meeting. General admission, however, was free.

About 2500 spectators attended the meet, though the night was hot and the general inclination was naturally to seek the parks and to stay outdoors. In the audience there were about as many women as men, and a large number of boys. It was notable that most of the men from industrial plants brought their wives and sons, and many their daughters also. The presence of the women and children was welcomed, as by their efforts safety-first and first-aid propaganda can be made to grow most rapidly.

Manufacturers Follow Lead of Miners

By special invitation the fire department of the city was also liberally represented. It had been specially announced that while the miners would demonstrate first-aid work as conducted at mines, the procedure would be similar to that in force at industrial plants and, indeed, wherever accidents occur.

As the object of the event was partly the promotion of safety-first propaganda, a few short speeches were made before the contest commenced. W. T. Grant, who introduced the speakers, reviewed the efforts made by large corporations to prevent accidents. He called attention to the large financial savings thereby accruing and to the loss of efficiency resulting from losing the services of men injured. He showed that the employed gained even more by saving their limbs and fingers, and even their lives in some instances.

Mayor Henry Jost of Kansas City declared that cities should be as careful to protect the citizens from accidents and from the ill effects of poorly treated injuries as it is to assure them safety from disease and rapid recovery from infection. These latter needs are now supplied by the work of boards of health, and in time we will learn to have an equal municipal regard for defense against accidents and their sequelæ. Senator James A. Reed declared that the police of the city could well go to school to the miners. Though the miners are the better trained, no one is called so often to the scene of an accident as the policeman, and he is usually as little prepared to give first-aid treatment as the ordinary citizen.

Rabid Remarks on Negligence

Senator Reed urged, with little reason, that one outcome of the present movement would probably be the establishment of the principle that an employer who allowed conditions under which fatal accident resulted would be regarded as guilty of criminal homicide. There is once in a while a demand that negligence shall be treated as severely as intention, but the public will continue to have more sense than such hotheaded law makers. No one is going to hang a miner for failing to close a door, much less an employer for having failed to see that some other miner or other employee closed it.

The miners, coal operators and others who promoted the event may be congratulated on the probable immediate outcome of the event, for a branch of the National Safety Council is to be organized in Kansas City, which will begin work with the eager coöperation of a majority of the manufacturers and men.

The contest was divided as usual into events for one and two men and for teams. The result, scoring by the table approved by the American Mine Safety Association, was as follows:

Oklahoma team from Lehigh, Okla., 888; Kansas team from Frontenac, Kan., 883; Iowa team from Hocking, Iowa, 843; Missouri team from Bevier, Mo., 823; Arkansas team from Calhoun, Okla., 822. A sixth team, of men appointed from among the visitors in the hall when the contest opened, took the place of the Texas team from Thurber, Tex., that did not appear. It scored 824.

Dangers of Mine in Dumb Show

Following the contest a demonstration of actual rescue work was staged. At one end of the hall a shed was erected about 5 ft. high, having low windows under the eaves except for about 12 ft. at one end. This represented a miniature mine. Inspectors examined the workings and reported gas in one chamber. There was a drunken miner with a pipe, an altercation, an entrance of the gas which filled the chamber and an explosion that filled the hall with smoke. A miner was projected through the tar-paper walls, apparently unconscious. The rescue teams rushed to the mine, and an automobile, filled with miners wearing breathing apparatus, dashed quickly into the hall. These rescuers dragged out the men caught in the explosion.

The rescue car from Pittsburg, Kan., No. 4, had been stationed for several days on a downtown switch track, and was visited by several thousand persons. After the meet this car returned to Pittsburg.

Meeting of Utah Fuel Co. Officials

At a recent meeting of the superintendents of the Utah Fuel Co. the subject considered was the education of foreigners. As the matter discussed was not of a technical nature but one of wide human interest, the meeting was largely an open one; consequently not only the superintendents, but the engineers, railroad men, mechanics, a veterinary surgeon and several mine and outside foremen, 18 in all, were invited and were present.

For the benefit of the visitors it was explained that the company had just made arrangements with the public schools in its various mining camps to give instruction in the rudiments of English, in American citizenship, sanitation and mining methods to all foreigners lacking a knowledge of the English language and American customs. The courses of instruction will follow closely those employed by similar institutions in the East, and motion pictures will be employed to illustrate the matters under consideration.

The need for this work is apparent to all those in charge of workmen; for of the more than 2000 men employed by the Utah Fuel Co., only 31.3 per cent. speak English, including Americans, white and colored, and British. Germans, Finns, Swedes, Austrians, French, Italians, Greeks, Japanese and Mexicans comprise the remainder, or 68.7 per cent. of the total. Of these 89.4 per cent. are Austrians, Italians and Greeks. A large percentage of these men can neither read nor write English, and understand it but little when it is spoken. They come to the mines with no knowledge of coal mining.

Many of these men, especially the middle-aged, have come to America solely with the intention of working just long and hard enough to save sufficient money to permit them to return to the homeland and live in comparative comfort for the remainder of their lives. It was the opinion of the meeting that there was only a small chance to educate such men and change their standards of life.

However, as a matter of safety for the majority of men in the mines, and as a means of rendering the work of the various foremen in charge of them less burdensome, the members of the council thought that no non-English-speaking man should be employed unless he would agree to take the course of instruction.

It was thought that the work should be concentrated largely on the young and ambitious and those who come to America as the land of promise and equal opportunities, for it was felt that greater success could be achieved with them. It was the consensus of opinion that special efforts should be made to instruct men in the fundamentals of mining and in methods of taking care of themselves and making their working places safe. The engineers in the meeting, speaking true to form, suggested that men be instructed how to obtain the greatest and best results with the least expenditure of labor and material.

It was recalled that when times were good and labor scarce great numbers of foreigners were employed, many of whom were not only ignorant of the way to mine coal but could scarcely make intelligible signs. Imagine the work of the poor foreman who had to maintain the output with such men.

Formerly all the drivers were Americans or British; now a large percentage are foreigners who, in their own countries, have had little or nothing to do with horses and mules. Many such regard an animal as merely a piece of mechanism entirely devoid of feeling, and treat it as such. As an example of the ignorance of the pulling capacity of a horse may be cited an instance related by the veterinary surgeon of the fuel company.

Two foreigners had hitched a horse to 12 large mine cars, each weighing when empty 2450 lb. In each of these cars was about a ton of grain. Two of the wagons were off the track and all were on an up grade, yet these men could not understand why the horse could not pull the load and abused it accordingly. The company has splendid animals, costing much money, and it takes pride in them. If by teaching men to understand English they can then be taught the care and abilities of a horse or mule, much would be accomplished.

While the details of this educational campaign are not all elaborated, it was the opinion of the meeting that it would be best to give an elementary course in reading and writing first and as the students become able to understand English to instruct them in mining methods, safety, etc. The public-school principals will be given authority to decide whether the men by their neatness and cleanliness are fit to enter the classes. It is hoped that in this way the desire for cleaner and more sanitary living quarters will be developed.

College of Mines, University of Washington

The annual short session for mining-men at the University of Washington recently closed its eighteenth year. In many respects it was the most successful in years, 38 students having registered for the work, 2 of whom were women. Of the entire registration 30 remained for practically the entire period. Quartz-mining subjects appealed to the greater number, with placer-mining next in interest. The oldest student was 52 years old, the youngest 19. Eleven of the men had previously attended some college and 3 were graduates. Most of the remaining students came with ordinary school preparation. Washington, British Columbia and Alaska were given as the addresses for most of those attending. Three students had previously attended the short session and returned for special work. Next year the nineteenth session will begin on Jan. 3 and will run for three months.

Discussion by Readers

Effect of Head on Pump Motor

Some time since there appeared in *Coal Age* (Vol. 7, p. 178) an inquiry by Richard Todhunter, asking what will be the effect on the motor driving a centrifugal pump if the head is reduced from 150 ft. to 75 ft. while the motor is operated at the same speed. The answer given at that time by some pump engineers was to the effect that under the reduced head a much larger quantity of water would pass through the pump, which would result in overloading the motive power, unless the pump was particularly designed to avoid this effect.

Later, H. D. Roberts opposed this opinion of the pump engineers, stating (*Coal Age,* p. 304) that he thought they were in error in saying that the motive power would be overloaded. Mr. Roberts presented some good figures to support his contention; but, in my opinion, the answer given by the pump engineers is correct. I will cite an instance that occurred under similar conditions, in my own experience, which proves the engineers' theory.

Our company had a double-gage, Weinman centrifugal pump, driven by a 40-hp. motor and discharging about 400 gal. of water per minute through a 4-in. discharge pipe. The pipe line was 1500 ft. long and had a vertical rise of about 10 ft. The pump was making 1100 r.p.m. under these conditions. As this arrangement was unsatisfactory in a wet season, it was decided to drive a ditch that would afford natural drainage. When the ditch had reached a certain point, I concluded to cut the pipe line and permit the water to flow into the ditch at that point. By this means the pipe line was shortened 600 ft. and the 10-ft. rise or head practically eliminated. I estimated that I could save power by doing this and use the extra pipe for the other pump.

At this time, however, my troubles began. The result of cutting the pipe line at the point mentioned was to cause a continual sparking on the commutator. We replaced the carbon brushes with soft graphite brushes; but that did not overcome the trouble. I then decided that, inasmuch as I had reduced the work of the pump nearly one-half, I should also reduce its speed, which could be done, as the pump was belt-driven. I took the matter up with the chief electrician and it was decided to use a smaller pulley on the motor, which would reduce the speed of the pump from 1100 to 920 r.p.m. This completely overcame the trouble.

In the course of time the ditch was completed and, as there was no longer any use for the pump at that place, it was moved to another location to take the place of two other pumps that were not doing satisfactory work. In moving the pump the small drive-pulley was damaged and we had to resort to the larger pulley formerly used for driving the pump. The result was that in two days the armature of the motor burned out. We put in another armature and bought another small pulley, after doing which there was no further trouble. In its new location the pump is discharging through a pipe line 1000 ft. long and having a lift of about 8 ft. This experience convinced me that when the lift of the pump is reduced one-half and the pump run at the same speed, the motor will be overloaded, as stated by the pump engineers.

Longwall vs. Room-and-Pillar Mining

Letter No. 2—I am a great believer in the longwall method of mining, and would like to render my decision in respect to the relative merits of this method as compared with that known as the room-and-pillar system of mining. I read carefully the arguments on the two sides of this question, as presented by Fred Morck, *Coal Age,* July 10, p. 60.

I want to say, in the first place, that the longwall method is the most improved and uptodate system of mining coal in use at the present time, as it gives a larger extraction of coal, greater safety to the men and better ventilation of the mine, which reduces the risk of an explosion occurring to a minimum. Can the advocates of the room-and-pillar system claim for a moment that they are following the motto, "Safety the first consideration"? They must acknowledge that nothing is more dangerous in the mining of coal than the poor ventilation of the working face that is so general in the room-and-pillar system, especially after the rooms have advanced beyond one or two breakthroughs.

We have only to look back in the records to find that all the large explosions, costing many lives and destroying much property, have occurred in mines worked on the room-and-pillar system. I do not think there is any record of an explosion occurring in a longwall mine. This fact alone should be a great argument in favor of that system of mining.

Again, it must be acknowledged that there is a great waste of coal that cannot be recovered when the mine is worked on the room-and-pillar system. In many localities where that system is used, not more than 50 or 60 per cent. of the coal is taken out, the remainder being left in the pillars. While I freely admit that it is possible to work any seam of coal on the room-and-pillar system, I claim that system cannot be worked economically and the mine be made to pay in many cases.

There is another important item in favor of the longwall system, and that is the facilities it affords for the cheap transportation of the coal from the face to the shaft bottom. I mean that the roads are more direct, leading to all points of the working face in every longwall mine. I consider that these advantages are of the utmost importance in the mining of coal and show that the longwall method is safer, healthier and more economical than any other system of mining.

G. R. WADDELL.
Moundsville, W. Va.

The Mine-Car Question

Letter No. 5—In an article published in *Coal Age,* May 1, p. 752, R. Z. Virgin suggests that the present tendency to use mine cars of large capacity, and consequently heavy weight, together with the increase of weight due to various alleged improvements, may be unwise, since these all tend to increase the first cost as well as the cost of maintenance of both cars and trackage, to say nothing of the increased cost of operation.

Mr. Virgin suggests that, owing to the increase in dead weight of mine cars without a corresponding increase in capacity, there may result a reversion to the old style, lighter weight and smaller capacity of the car. He states that certain cars of 2 tons' capacity, weighing formerly 1800 lb., now weigh from 2800 to 3500 lb., which is certainly a disproportionate increase and, I should say, shows poor design.

I believe there is a practical limit to the size of mine cars, and a point where refinements increase instead of decrease the cost of underground haulage. When one reflects that transporting the coal from the place where it is mined to the surface where it is loaded for shipment constitutes the greatest factor in coal-mining economy, the design of cars that will give the maximum of efficiency deserves the most careful attention.

In my opinion the selection of the type and size of car best adapted to given conditions does not permit of a wide choice, but is limited by local considerations. Too often it has happened that the mine car in use is a development of an original type that someone thought best served the purpose, and changes were made from time to time, as dictated by experience. This has established a certain "standard" type, which was duplicated whenever new cars were added to the equipment of the mine.

In the study of the dimensions of the car best suited to existing conditions, the following items should be carefully considered:

1. Thickness of coal seam, as influencing the height of the car.
2. Nature of top and bottom of seam, as necessitating the driving of more or less narrow entries and thus influencing the width of the car.
3. A soft bottom having a tendency to heave may make it wise to reduce the height of the car so as to require less headroom in entries that may be affected by a squeeze.
4. The dimensions of the hoisting shaft that may limit either the length or width of the car, or both.
5. The gage of the track, as influencing the width of the car.
6. The loading of the cars at the working face, as influencing the height and style of the car.

The following conditions should be carefully considered in deciding on the capacity of the mine cars:

1. Where the coal is mined on a basis of screened coal—that is to say, where the operators' and miners' agreement provides for payment at a stipulated rate for all coal passing over a 1¼-in. bar-screen, 6 ft. wide and 12 ft. long, it is not possible to effectively screen more than two tons of coal dumped rapidly from the usual automatic dump-cage.
2. When operating on the mine-run basis, the only consideration affecting the capacity of mine cars is the ease of moving the cars, especially the handling of the cars by the miner in his working place. This question can only be decided after carefully studying the local conditions in respect to the grades of the haulage roads, the ease with which cars can be handled at the face, and whether mules or locomotives are used for gathering the cars. At the best, mine tracks are not surfaced or aligned like railroad tracks and are frequently subject to short heavy grades, which would forbid the use of cars of large capacity. It must be remembered that derailments are liable to occur at frequent intervals, and will cause much delay, unless the car can be quickly replaced on the track. These considerations call for the correct judgment of local conditions.

While it is true that the use of heavier cars calls for heavier locomotives and rails and better tracks, this fact can hardly be construed as a criticism of their use if transportation facilities are thereby improved, resulting in speedier trips, fewer wrecks and less power consumption per ton-mile, which all operate to produce cheaper coal, or reduce the cost of production. As the capacity of the mine car is increased the ratio of dead load to live load is lessened. It must be remembered that practically the same time is consumed for gathering the mine cars and hauling them to the surface whether the cars have a capacity of two tons or four tons each. Likewise, the operations of coupling, spragging, trapping, caging, hoisting and dumping are practically the same without regard to the capacity of the car. With these considerations in mind, it is difficult to see how a light car of small capacity possesses any advantage over a car of larger capacity, although the latter is heavier and requires heavier equipment generally, provided the conditions permit the use of cars of such capacity.

Mr. Virgin raises the question of whether the loader shares the benefit derived from the use of cars of large capacity. The answer to this question is that if the ratio of dead weight to live load is properly proportioned, the loader shares with the operator in the increased output afforded by cars of larger capacity. There is, besides, less chance of his being unable to load the coal mined, for lack of sufficient cars. The larger cars thus afford the miner a chance to increase his earnings, and incidentally attract to the mine a better class of loaders who are looking for places where they can earn more than an average wage.

Having decided on the capacity of the car that should be adopted in a given mine in accordance with the foregoing suggestions, the dimensions of the car must be worked out similar to that described in *Coal Age,* May 22, p. 904. The cross-section of the car must be determined first, the width of the bottom being made 6 in. less than the track gage when 1½ in. lumber is used. The height of the bottom portion of the car should be just sufficient to permit the flare-board to clear the wheels, allowing room for the cage-keeper, if in use, above the wheel. It is important to keep this height of the lower portion of the car as small as possible. It is determined by the half-diameter of the wheel, the thickness of the lumber used and the sizes of the axles and bearings.

The flare-board is often laid flatter than a 45-deg. angle, so as to increase the width of the car as rapidly as possible above the wheels. The support of this flare-board naturally is more difficult, as its inclination is flatter. A pitch of one vertical to four horizontal is not uncommon, and the width of the board often reaches 15 or 16 in. This must all be determined, however, in connection with the limiting width of the car.

The next step is to determine the height of the top-rail of the car above the track, or the depth of the car above the top of the flare-board. This, together with the amount of "topping" permitted, is limited by the maximum headroom allowed. Regard must also be had to the convenience of loading the car at the working face. My experience is that 44 in. is about the maximum desirable height of the top-rail of the car above the track, to permit of easy shoveling.

Having worked out the dimensions of the cross-section of the car and calculated its area, the inside length of the car is obtained by dividing the necessary cubical capacity (allowing, say 40 cu.ft. per ton of mine-run coal) by the sectional area in square feet. To the length so obtained must be added a sufficient allowance for the thickness of the end-boards and bumpers at each end of the car. It may happen that the results obtained will exceed the permissible length of the cars, as determined by certain limiting local conditions. In that case it will be necessary to alter the sectional dimensions sufficiently to give the desired length, or reduce the capacity of the car.

The size of wheel to be used will depend mostly on the weight of the loaded car. Larger wheels are easier-running and wear longer than wheels of less diameter. The width of the wheel through the hub should be sufficient to furnish a wide bearing on the axle, which should be symmetrical with the tread of the wheel on the rail.

Both square and round axles are in general use. The square axle is strapped directly to the car bottom, which construction is more easily maintained than the round axle running in boxes attached to the car bottom. The latter, however, permits a more uniform distribution of the load on the axle and produces a more uniform wear of the bearings than is possible in the use of square axles, where the weight rests on the journals at the ends of the axles. Channel-iron, plates and bars of special form are frequently used to maintain the boxes in proper position and alignment. The size of the axle may be calculated by considering it as a beam uniformly loaded and supported at its two ends, allowing an ultimate strength of 100,000 lb. per sq.in. for axle-steel and using 8 as a factor of safety.

The wheelbase of mine cars is necessarily small in order to facilitate the replacing of the car on the track when derailed. A short wheelbase also permits the use of curves of shorter radius. Approximately ¼ the length of the body of the car may be taken as the necessary wheelbase.

The track gage is usually determined by local conditions, present practice using wider gages than were formerly employed, which marks a general improvement in haulage equipment. Mine track gages of 36, 40, 42 and 48 in. are in common use. Car bumpers should be long enough to prevent the corners of the cars coming together on the sharpest curve allowed in the mine. The bumpers should be thick enough to prevent their riding each other. Couplings should be long enough to avoid cramping the bumpers on sharp curves.

The number and size of body irons depend on the size of the car; but irons of good thickness are economical, as the corrosive action of mine water wears them away. In my opinion, a reasonable increase in the weight of a mine car, caused by a suitable reinforcement that tends to prolong the life of the car and keep it out of the repair shop, and prevent the frequent occurrence of wrecks resulting in much delay and loss of output, is always well justified and desirable. These practical considerations are of even greater importance than the restriction of the ratio of dead weight to live load.

I have thus attempted to present in a general way what appeals to me as the more important considerations affecting the design of mine cars. My conclusions are based on my personal observation and experience in the design and use of such cars and a judgment that has led me to argue for a reasonably big car built for long service. While I realize that others, like Mr. Virgin, may take the contrary view, I feel that the subject is one of great practical importance, and I hope to see it thoroughly discussed.

Harrisburg, Ill.

Mining Laws and Legislation

Letter No. 6—Referring to Mr. Hogarth's letter, No. 4, *Coal Age*, June 5, p. 988, in which he attempts to prove that the assistant mine foreman is a legally responsible official under the bituminous mine law of Pennsylvania, I want to ask him to point out the section of the law under which the assistant mine foreman can be held responsible for any of his acts in an official capacity. I have stated in a previous letter that by the phraseology of the law the assistant mine foreman is an irresponsible party. This statement is based not on opinion but on facts, confirmed by the reading of the law.

The bituminous mine law distinctly states that the assistant foreman shall act under the instructions of the mine foreman. This statement does not necessarily imply that the assistant must receive detailed instructions from his foreman relative to the work of each shift. To assume such a meaning would be to frustrate the purpose of this provision of the law, since the mine foreman would then have personally to inspect the entire mine so as to be able to direct the work in each section intelligently. The law provides the assistant to relieve the mine foreman of this burden. I understand, however, the intention of the law to be that the assistant shall have the authority of a mine foreman in his particular section of the mine, with the sanction and consent of the mine foreman, who is the responsible party.

I presume that Mr. Hogarth, as a citizen of the United States, knows that when an individual is elected as a representative either to a State Assembly or to a Federal Congress he is immune from arrest by the civil authorities, except for certain specific crimes. The reason for this is that the law recognizes such a representative not as an individual but as impersonating a constituency. The law regards that his actions during his term of office are virtually the actions of his constituents.

I would ask, again, why does a mine inspector make his recommendation to the mine foreman and not to the assistant foreman? The reason is plain—because the law permits him to hold only one individual responsible.

I believe Mr. Hogarth is in error when he states that "the mine foreman is responsible only for the orders given to his assistant, and the assistant for the faithful performance of the same." If this is true, the foreman's responsibility is limited to his issuing correct orders and the assistant's responsibility to the degree of faithfulness with which these orders are carried out. In my opinion, such a conception applies only to specific orders or instructions given by the foreman to his assistant. It appears to me that if the application were general, all responsibility would be shifted from the shoulders of the mine foreman to those of his assistant and the foreman would be free.

When a mine foreman gives a specific order to his assistant and an accident occurs as the result of the assistant's carrying out such an order, the responsibility for the accident is undoubtedly the mine foreman's; but Mr. Hogarth would have us believe that if an accident occurs under the direction of the assistant foreman when no specific orders have been given, the responsibility rests on the assistant and not upon the foreman. I do not regard this as the meaning of the law.

When Mr. Hogarth states that the mine foreman can be held responsible only for the orders he issues and for the employment of those whom he believes to be competent men to act as his assistants, he practically admits that the responsibility for the assistant foreman's official acts rests upon the foreman, inasmuch as he is made responsible for employing a competent man.

In reply to the insinuation that I regard the foreman as a mere figurehead, whom the law authorizes to employ a sufficient number of assistants to perform his work, I would draw attention to the reading of the bituminous mine law, art. 4, sec. 1, where it states in the second paragraph: "When the mine workings become so extensive that the foreman is unable, personally, to carry out the requirements of this act, pertaining to his duties, he shall have the right to employ a sufficient number of competent persons to act as his assistants," etc. As I understand the reading of this law, the entire work performed by the assistant makes up the duties referred to in the law as the mine foreman's duties.

Mr. Hogarth states that he does not think for a moment that any mine foreman would attempt to hide behind his assistant or throw the responsibility that was his own on the other man's shoulders. I want to refer him to the case of Willis vs. Commonwealth, in the 20th bituminous district of Pennsylvania. Mr. Hogarth seems to express his opinion of what the law should be, while I have tried to show what the law actually is as it reads.

I. C. Parfitt.

Jerome, Penn.

⁂

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

Sources of Heat—In a sense the sun is the original source of most of the heat of the solar system—in other words, the sun is the power house of that system. It may be said that much of the terrestrial life and activity emanates from the sun. The source of the sun's heat is understood to be the chemical and possibly electrical activities being constantly developed in its huge mass and radiating heat, light and electrical energy.

The same chemical and possibly electrical activities are taking place to a less degree in the mass of the earth, creating internal heat. Both the radiated heat of the sun and the housekeeping ternl heat of the earth are **natural sources of heat.**

Besides these natural or physical sources of heat, there are the **mechanical sources of heat,** such as **friction, impact** and **pressure.** These each develop heat as the result of force applied mechanically.

Chemical Heat—Theory assumes that chemical heat is the result of the **chemical affinity** of material atoms for each other, by which they are drawn and held in more or less close contact and union. This condition is in harmony with the notion of "atomic heat," explained elsewhere, and suggests the estimation of the **heat of formation, or heat of combination,** as the result of chemical union.

In contrast with atomic heat, **molecular heat** is akin to specific heat and representative of the heat capacity of a substance, or the quantity of heat a particular substance will absorb, per unit weight, per degree of rise in its temperature. Theory assumes that all heat of any nature is a vibratory state of atoms or molecules and, as such, is convertible into or created by other forms of energy.

The **molecular heat** of a substance is found by multiplying a gram-molecule of the substance by its specific heat.

Combining Heat—All matter is assumed to possess a certain definite heat energy peculiar to itself, which is expressed in heat units, per unit weight of substance.

Heat of Formation—In the combining of atoms to form compound molecules, a neutralization of the energies of the combining atoms causes either an evolution or an absorption of heat, the molecule formed then possessing an amount of heat called "heat of formation" or "heat of combination."

Heat Due to Friction—Friction is caused by one body rubbing against another, whereby a molecular vibration is set up in the two bodies, as manifested by the heat generated.

Heat Due to Impact—The impact of one body against another likewise sets up a molecular vibration in the bodies, which is manifested by the heat generated.

Heat Due to Pressure—Pressure applied to a body having a degree of elasticity, or being compressible, forces the molecules of matter closer together, which reduces the intermolecular space and, as a result, there being no loss of molecular energy, the speed of vibration is increased in proportion as the space is diminished and heat is developed.

Transformation of Heat Energy—Heat energy of any nature, whether chemical or physical, is convertible, without loss, into mechanical energy measured in foot-pounds, which is the "mechanical equivalent of heat."

The Coal Age Pocket Book

THERMOCHEMISTRY

Thermochemistry treats of the heat changes that accompany all chemical reactions. A knowledge of such heat changes is of the greatest importance in the study of explosive phenomena.

Heat Changes—In a chemical reaction, combination always takes place, the heat energy of the compound or compounds formed being the **heat** or **heats of formation.**

Chemical reaction may also be accompanied by dissociation or decomposition of a compound, its heat of formation being then **heat of decomposition,** which neutralizes or is neutralized by the heats of formation of the products of the reaction. The heat of decomposition of a substance is always equal to its heat of formation.

The **heat of elements,** in a reaction, is always zero, there being no combination or dissociation in the element.

When the sum of the heats of formation of the products of a reaction is greater than the total heat of decomposition **heat is liberated** and the reaction is "exothermic." When the total heat of decomposition is the greater, heat is absorbed and the reaction is then "endothermic."

Heat of Combustion—This term is generally applied to the heat liberated in the oxidation of a combustible. The reaction is exothermic; and, in general,

$$\text{Heat of combustion} = \underset{\text{of products}}{\text{Heat of formation}} - \underset{\text{of combustible}}{\text{Heat of formation}}$$

The heat of combustion of a substance, like combining heat and heats of formation or decomposition, is expressed in heat units, per unit weight of substance. The following table gives the heats of combustion of some of the more important combustibles in mining:

TABLE OF HEATS OF COMBUSTION (Favre & Silbermann)

Combustible			Heat of Combustion, B.t.u. per Lb.
Methane, to carbon dioxide and water at 32 deg. F.			23,513
Olefiant gas, to carbon dioxide and water at 32 deg. F.			21,344
Carbon, to carbon dioxide			14,544
Carbon, to carbon monoxide			4,451
Carbon monoxide, to carbon dioxide			4,325
Hydrogen, to water at 32 deg. F.			62,032
Hydrogen, to steam at 212 deg. F.			51,717
Sulphur, to sulphur dioxide			4,000
Petroleum, heavy (sp.gr. 0.886)			19,000
Petroleum, light (sp.gr. 0.833)			18,200
Coal, average values,	(State)	(Fixed Carbon)	
Anthracite	Pennsylvania	84.3%	14,200
Bituminous	Pennsylvania	57.0%	14,900
Bituminous	West Virginia	65.8%	14,240
Bituminous	Illinois	46.4%	14,460
Bituminous	Ohio	51.5%	14,400
Bituminous	Kentucky	50.1%	12,700
Bituminous	Alabama	59.3%	13,700
Bituminous	Indiana	44.3%	14,140

The above are average values for each entire state, as taken from Government analyses and do not represent mining districts.

Inquiries of General Interest

Preserving Mine Timber

I desire to ask: (a) Is there any method in use for preserving mine timbers, particularly the crossbars used in mines, by dipping them in creosote, zinc sulphate or other preserving solutions, and what results have been accomplished by so doing? (b) Is it necessary to kiln-dry such timbers before dipping them? (c) What solution is considered best and cheapest for this purpose, and how long should such timbers be left in the solution? (d) Are there any data available showing the increase in the life of mine timbers when treated by any process intended to preserve the wood?

E. C. Leightty.

Danville, Ill.

These questions were submitted to the chemist of one of the largest manufacturers of wood preservatives and elicited the following reply:

(a) There are various methods in use of treating mine timbers with special preservatives—creosote, zinc sulphate, and the like. The results obtained have been satisfactory in proportion to the value of the material used and the thoroughness with which the treatment was effected. Owing to these varying conditions, it is impossible to state more explicitly the results accomplished.

(b) While it is not absolutely necessary that the timber should be kiln-dried before being treated, it is desirable that it should be as dry as possible, so that the wood will more readily absorb the preserving solution. This is particularly true in respect to creosote preservatives, which are the most efficient, because the creosote cannot penetrate the wood when the pores are full of moisture.

(c) In regard to what solution will prove the best and cheapest to use for preserving large timbers by dipping them, I may state that the coal-tar distillates have proved to be by far the most effective and economical. A wood preservative known as "conservo"—a brownish oily liquid distilled from coal tar—is the result of several years of experiments made to develop a liquid that will be sufficiently fluid to penetrate the wood and at the same time have sufficient substance to prevent its evaporation and loss, which would destroy the permanency of its preserving effect.

This preservative destroys bacteria and sterilizes the wood. It is practically nonvolatile and insoluble in water, which prevents its loss when timbers so treated are submerged or exposed to the action of moisture. It can be applied either hot or cold—with a brush, as paint is applied, or by dipping the timbers in tanks containing the liquid. The latter method is recommended for the treatment of mine timbers.

The length of time that the timbers should remain submerged in the tank depends on the character of the wood and whether the preservative is used hot or cold. It is always better to apply heat when that is feasible, because the heat increases the penetrating power of the preservative and drives out any latent moisture from the wood. A steam coil placed in the bottom of the tank will serve to heat the liquid and shorten the time of treatment, which can be varied from a few seconds to several minutes, depending on the degree of heat employed, the character of the wood and the thoroughness of application desired. The wood should be as dry as possible before placing in the tank. In special cases when great permanence is desired and the timbers are large, they are allowed to remain soaking in the tank for a longer period.

(d) The only available data respecting the increase in the life of timbers treated by different methods are to be found in the various publications of the Forest Service, United States Department of Agriculture. Circular No. 101, entitled "Treating Timber with the Open-Tank Process," is said to be out of print. There is much valuable information, however, contained in circulars Nos. 108 and 111, of the Forest Service Bureau—the former being entitled "The Strength of Wood as Influenced by Moisture," and the latter "Prolonging the Life of Mine Timbers." These publications were issued in the summer and fall of 1907. In addition to the brush and open-tank methods, the Government experimented on treating timbers in a closed cylinder under pressure, which greatly increased the penetration and effect of the preservative. The report shows that the life of timber treated with a creosote solution by these methods was prolonged as follows: Brush treatment, 6 per cent.; tank treatment, 41 per cent.; and cylinder treatment, 55 per cent.

⁂

Fireproofing Mine Canvas

Can you tell me how to fireproof canvas used for brattice cloth in the ventilation of a mine?

H. A. Everest,
Superintendent, Hazelton Coal Co.

Coalgate, Okla.

Numerous preparations have been used from time to time to render fabrics fireproof, and these attempts have met with variable success. For this purpose such salts as the silicates of zinc, lead and tin have been mostly employed. Certain firms interested in the question of fireproofing material have made a careful study of the subject, with the result that more or less effective fireproofing solutions have been prepared and are now offered on the market. The price of these solutions is practically prohibitive for mine use.

The Antipyros Co., 170 Greene St., New York City, offers for sale heavy duck canvas, in rolls of 50, 100 and 150 yd., 2 yd. wide, which is claimed to be fireproof and suitable for mine use as brattice cloth.

Readers of *Coal Age* will be glad to learn of the experience of any who have attempted the fireproofing of cloth and other combustible material used in mines. A preparation known as "oxylene" has recently been employed with much success in fireproofing timber in England, but has not as yet, we believe, been used in this country.

Examination Questions

Miscellaneous Questions

(Answered by Request)

Ques.—If a collar 6 ft. long and 8 in. in diameter supports a certain weight, what must be the diameter of a collar 12 ft. long to support the same weight?

Ans.—The question omits to state whether the entire load resting on the full length of the collar or the unit load per foot of length is intended. The solution is different in each case. For the same total load, the diameter of the collar varies directly as the cube root of the length of the collar; or, in other words, the diameter ratio is equal to the cube root of the length ratio, which gives in this case, calling the required diameter *x*,

$$\frac{x}{8} = \sqrt[3]{\frac{12}{6}} = \sqrt[3]{2} = 1.26$$

$$x = 8 \times 1.26 = \mathit{say}\ 10\ \mathit{in.}$$

The more usual condition in mining practice is, however, the unit load, or load per foot of length, corresponding to the roof pressure that the timbers must support. In this case the diameter of the collar varies directly as the cube root of the square of the length, which gives

$$x = 8 \times \sqrt[3]{2^2} = 8 \times \sqrt[3]{4}$$

$$x = 8 \times 1.58 = 12.6\ \mathit{in.}$$

Ques.—If the temperature of 10 cu.ft. of air is raised from 60 to 580 deg. F., what amount of work will be done?

Ans.—In the free expansion of air the external work performed is that required to overcome the atmospheric pressure (14.7 lb. per sq.in. or 2116.8 lb. per sq.ft., sea level). Assuming a column of air having a base of 1 sq.ft. and 10 ft. in height, and supposing the expansion to take place in the direction of the height of the column, since the volume of air varies directly as its absolute temperature, the height of the air column after expansion will be

$$\frac{460 + 580}{460 + 60} \times 10 = \frac{1040}{520} \times 10 = 20\ \mathit{ft.}$$

The increase in the height of the column is then 20 — 10 = 10 ft. and the work performed, in this case, is 2116.8 × 10 = 21,168 ft.-lb.

A similar result can be obtained by estimating the work on a heat-unit basis. Evidently the external work performed in the free expansion of air corresponds to the difference between the absorption of heat by air under constant pressure and that under constant volume. For a single pound of air, and one degree (F.) rise in temperature, this difference is the difference between the specific heat of air for constant pressure (0.2374) and that for constant volume (0.1689), which gives 0.2374 — 0.1689 = 0.0685 B.t.u.

The weight of 10 cu.ft. of air at atmospheric pressure (sea level) and a temperature of 60 deg. F. is 10 × 0.0766 = 0.766 lb. The total rise in temperature, in this case, is 580 — 60 = 520 deg. F. Then since 1 B.t.u. equals 778 ft.-lb. of work, the external work performed in the expansion of 10 cu.ft. of air, owing to a rise of temperature from 60 deg. to 580 deg. F., is

$$0.0685 \times 0.776 \times 520 \times 778 = 21{,}227\ \mathit{ft.\text{-}lb.}$$

Ques.—How many pounds of carbon will be required to burn 100 lb. of oxygen in the production of carbon monoxide?

Ans.—In the production of carbon monoxide by the burning of carbon in oxygen one atom of oxygen unites with one atom of carbon to form a molecule of carbon monoxide (CO). The relative weights of carbon and oxygen in this reaction are expressed by their atomic weights—carbon, 12; oxygen, 16. Hence, calling the weight of carbon required to consume 100 lb. of oxygen *x*, we have

$$16:12::100:x = 75\ \mathit{lb.}$$

Ques.—A fan running at 70 r.p.m. produces 120,000 cu.ft. of air per min. under a 2.5 in. water gage. At what speed must the fan run to produce 150,000 cu.ft. of air per min. in this mine, and what would the water gage be for this increased speed and circulation?

Ans.—In fan ventilation the volume is commonly assumed as being proportional to the speed of the fan. In other words, the volume ratio is assumed to be equal to the speed ratio of the fan. On this basis, calling the required speed of the fan *x*, we have

$$\frac{x}{70} = \frac{150{,}000}{120{,}000} = \frac{5}{4} = 1.25$$

$$x = 1.25 \times 70 = 87.5\ \text{r.p.m.}$$

In practice this result is not realized, but the fourth power of the speed ratio is equal to the fifth power of the quantity ratio, which gives, in this case,

$$\frac{x}{70} = \sqrt{\left(\frac{5}{4}\right)^5} = \sqrt[4]{1.25^5} = 1.32$$

$$x = 70 \times 1.32 = 92.4\ \mathit{r.p.m.}$$

For the same conditions in the mine, the water gage varies with the square of the quantity of air in circulation. Hence, calling the required water gage *x*, we have, in this case

$$\frac{x}{2.5} = \left(\frac{5}{4}\right)^2 = 1.25^2 = 1.56$$

$$x = 2.5 \times 1.56 = 3.9\ \mathit{in.}$$

Ques.—Under what conditions may afterdamp become explosive?

Ans.—When the afterdamp of an explosion contains considerable unburned methane or a large proportion of carbon monoxide the mixture may become again explosive by the addition of fresh air proceeding from other portions of the workings of the mine or supplied by the readjustment of the air current.

Ques.—What changes take place in the atmosphere of a mine during an explosion of firedamp?

Ans.—The oxygen of the mine air combines with the carbon and the hydrogen of the firedamp to form carbon dioxide and water vapor and some carbon monoxide is produced if the supply of air is limited.

Coal and Coke News

PENNSYLVANIA

Anthracite

Scranton—While the mining of anthracite by machine has not been generally adopted it is probably being used to a greater extent in the cutting of coal in this district than anywhere else in the anthracite region. The miners admit that the cutting of coal by machine is practically in its infancy, yet they realize that it is rapidly coming to be an important factor in the industry and are asking that an agreement be made with the operators whereby this grade of work will be paid for at an equitable rate.

Pottsville—The local strike which has existed at the Locust Gap colliery of the Philadelphia & Reading Coal & Iron Co. since last May has been practically ended by the men agreeing to return to work pending an appeal of their grievance to the Conciliation Board. The suspension was caused by a dispute as to the method of payment, and 1200 men have been idle for the past two months.

Packer No. 5 colliery of the Lehigh Valley Coal Co., at Lost Creek, has been shut down by a strike. Orders were issued that all inside men should remain on duty a half hour longer than usual. This order was disobeyed by several men and they were discharged. On learning of their dismissal the entire force of 1200 men refused to continue at work.

A new colliery to supply domestic trade is to be started by the Rosenberger Brothers on Sharp Mountain. A coal bed has been discovered which is much harder than any heretofore found in that region. Plans are underway for the construction of a breaker considerably larger than any here-to fore built in that locality.

Wilkes-Barre—Damages amounting to $25,000 are asked for in a suit filed by Frances Michock, of West Nanticoke against the West Nanticoke Coal Co. The husband of the Plaintiff was electrocuted about four months ago and the company is charged with negligence.

Tamaqua—During most of the summer, the Morea and New Boston collieries of the Dodson Coal Co. have been working three or four days a week. They have recently, however, started working full time.

Shenandoah—Five men were hurt in various mining accidents in the collieries of this vicinity in a single day the past week. Among this number, Peter Nitsavage received probable fatal injuries.

Shamokin—Nine hundred miners at the Hickory Ridge colliery of the Susquehanna Coal Co., recently went on strike to compel some of the employees to pay dues into the union. This tied up the entire plant.

Bituminous

Scottdale—The H. C. Frick Coke Co. recently ordered into operations 260 additional ovens. The plants affected by this order are Colonial No. 1, Continental No. 3, Edenborn, Hecla No. 3, Leisenring Nos. 1, 2 and 3, United, York Run, Hostetter and Whitney.

Connellsville—Nine hundred ovens were recently added to the producing capacity of the Connellsville coke region, bringing the possibilities of production up to 400,000 tons per week. This production has not been reached, but 371,000 tons weekly has been produced. The furnace ovens are operating at 76½ per cent. capacity, while the merchant interests are operating at 62.6 per cent. There appears to be no particular shortage of labor.

Monessen—A first aid contest to decide who shall hold the silver loving cup for a year will feature the annual picnic and outing of the miners of District No. 5, to be held on Saturday, Aug. 14, at Eldora Park. Over $300 in prizes will be awarded. Twelve teams are now entered in the first aid events, and probably more will enter. In addition to the cup, the members of the winning team will be given gold and silver medals.

Washington—Charged with violating the bituminous mining laws of the state by carrying black powder in excess of 5 lb. into the Penobscot mine of the Avella Coal Co., two Italian miners were recently placed under arrest on information placed by Mine Inspector C. J. Callaghan of the 26th District. The men were arraigned before Justice of the Peace J. F. Carmichael and held for court.

Herminie—Work has already been started on the grading and opening of the drift mine into the Waynesburg coal bed on the Mitchell farm near Herminie. E. G. Smith, of Irwin, has charge of the construction work.

WEST VIRGINIA

Bluefield—The Raleigh Coal & Coke Co. during June loaded 60,000 tons of coal, which is the largest one month's business ever enjoyed by that firm. Preparations are being made to increase the tonnage to 100,000 tons per month.

Mullens—The Mullens Smokeless Coal Co. recently shipped its first output. This operation is across the Guandotte River from the railroad the coal from the mine being transported across the river to the railway in buckets on an aërial tramway.

Parkersburg—The semi-monthly pay of the Consolidation Coal Co. for the first half of July was the largest since 1914, the miners in the Clarksburg Districts receiving $90,000. The past month was the best in the company's history but prospects for the current month are even better. Twenty-eight thousand seven hundred and fifty-six tons were recently mined in one day.

Moundsville—The Mound City Coal Co. has a force of men at work on a building which is to be used as a mine supply room. Here mine supplies of all descriptions will be kept ready for use at any time.

Gary—The No. 4 stable of the United States Coal & Coke Co. was recently destroyed by fire originating from an unknown cause. It is reported that 14 head of mules were lost in this fire as well as a considerable amount of hay and grain. The monetary loss is estimated at $4000.

Charleston—During the 21 months that the Workmans Compensation Law has been in effect in West Virginia, $136,000 has been paid in pension claims. The Eccles explosion has thus far cost $29,880, the Layland explosion $4000 and the Carlisle $590.

Prosecutions have recently been conducted in two of the mining districts of the state for violations of the law relating to the safety of operations. In one instance occurring at Yukon, McDowell County, a mine foreman was convicted of allowing miners to enter the shaft before the fans had cleared the atmosphere. In another case, 17 miners were found guilty of shooting coal from the solid. Each of the 17 were fined $10 and costs and warned not to offend again. The mine foreman who allowed the miners to enter before the mine had been cleared of gas was fined $50 and costs.

KENTUCKY

Lexington—The strike at the mines of the New Jellico Mining Co. in Bell County has been settled. The company granted a 10 per cent. increase to the men. There are still 600 miners out at other mines in Bell County.

Fleming—The Elk Horn Mining Corporation has received some large orders from the Great Lake region for early delivery and makes the announcement of increases in the output. The mines around Fleming, Haymond, McRoberts, Jenkins and Burdine are the most active since developments were first started. Already the railroads are taxed to handle the large tonnage. With increased output more trains will have to be added.

OHIO

Columbus — Ten thousand Hocking Valley miners, two-thirds of whom are idle and the other third earning only a fraction of normal income, have filed, through their officials, a petition with Governor Willis, asking that some means be devised for relieving the destitution of that region. One plan that had previously been proposed by the Governor was to begin construction on public highways throughout the Hocking Valley. The highway department announces that it is out of funds with which to prosecute this enterprise.

Wellston—The first shaft into the new coal region east of Wellston will be started as soon as the elevation of the coal measure can be ascertained by the drillers. The company has taken options on adjoining land which will be thoroughly drilled and proven, in order to determine the levels of No. 2, No. 4 and No. 5 coal beds. The first shaft will have an equipment capable of securing 2000 tons per day from the No. 2 measure. Six hundred men will be employed in the new Wellston mine.

INDIANA

Bicknell—Robinson Bros. of Lincoln who are sinking a shaft opening for a coal mine near Edwardsport, have reached the River vein. Later they will work a deep coal bed north of this mine.

ILLINOIS

Edwardsville—The suit in assumpsit for $15,000 by the Illinois Coal Operators Mutual Employees Liability Insurance Co., against the Lumaghi Coal Co., of Collinsville, has been dismissed at the request of the plaintiff. It is believed that a settlement was made out of court. The bill alleged that the defendant failed to live up to the terms of an insurance policy.

Judge J. F. Gillham, of the Madison County Circuit Court has issued an order directing the Illinois Coal Co., to produce its books in court to show how a dividend of $12,000 was dividend among stockholders on March 2, 1909, two days before suit for an accounting was filed by the Mount Olive and Staunton Coal Co. The Illinois Coal Co. was formerly a flourishing organization. Attorneys for the Mt. Olive and Staunton company have asked permission to file a bill of execution against the stockholders of the Illinois Coal Co. for $4,118.77, the amount of the judgment obtained in the suit for an accounting. The plaintiff company alleges that when the judgment was given there were no funds in the defendent company to satisfy the judgment.

Carlinville—The Superior Coal Co. has obtained an injunction against the Miller Oil Co. at Staunton and the Ohio Oil Co. in the same field to restrain them from drilling through the coal company's coal rights to reach the oil sands. The court proceeding has put a check upon the Macoupin County oil boom. It is expected that the case will be fought through to the highest courts and the mineral rights of the coal companies determined.

New Baden—The mine of the New Baden Mining Co. has been closed on account of damage to the shaft. It is expected to remain idle 10 or 15 days.

KANSAS

Topeka—John Pellegrino, state mine inspector, reports that the Western Coal & Mining Co., will open its mine in Franklin and expects to employ all the idle men there. The Sheridan Coal Co., is going to open mine No. 8 at Breezy Hill; the Western Coal & Mining Co., already has opened mine No. 14 at Fleming; and the Cherokee & Pittsburgh Coal & Mining Co., has leased mine No. 14 at Capaldo, and expects to start operations shortly.

Pittsburg—One miner was killed and another badly injured in a recent gas explosion at Mine No. 7 of the Sheridan Coal Co. near Mulberry. The plant had been idle several days because of water in the workings.

COLORADO

Denver—The long-pending suit of the Government against the Union Pacific Coal Co. will be heard shortly. The Government seeks to cancel the patents held by the company to 2400 acres of coal land in the vicinity of Durango that had been originally entered under the Timber and Stone Act.

FOREIGN NEWS

Berlin, Germany—It is reported that a mining engineer who went to Turkey, just before that country entered the war, for the purpose of hunting for coal deposits which might make the country independent of foreign sources has found three excellent coal measures. The Turks proceeded to develop these at once, and the German government now believes that the coal problem of its ally will not prove of embarrassment while hostilities last.

Wainwright Inlet, Alaska—It appears that the government can stop the whites from mining coal in Alaska, but not the natives. They have already mined several hundred tons from the bituminous seams near here, and have made arrangements to ship it to their villages. The Eskimos viewpoint since they have learned that black rock will burn, is that the rock was there before the government came along, and the Almighty must have put it there for them to use. Anyway, it burns much better than waterlogged driftwood.

Fernie, B. C.—A further inquiry into the explosion in the "B" North Mine, Coal Creek, which occurred on Jan. 2 of this year has been ordered by W. J. Browser, acting minister of mines in view of the commissioner's report on evidence taken at the investigation in March. This evidence, the minister declares, warrants a further investigation. The new inquiry opened with Judge Forin, of Nelson presiding as commissioner. The preliminary investigation found that the explosion was attributable to an accumulation of gas due to stoppage of the ventilating fan. The mine superintendent and mine foreman are charged with having been dilatory in their duties.

Juneau, Alaska—Discovery of an extensive coal field on Admiralty Island said to be the first of its kind found in Southeastern Alaska, has been reported. The coal was discovered about June 20 by Charles Sandman who at the time was engaged in cruising timber on the island. Having staked a claim Sandman hastened to Juneau where he interested some friends who are now financing the proposition. A patent has been applied for. According to the information obtained from Sandman the coal field is situated on the island 3 miles north of Killisnoo and 30 miles south of Juneau by water. The coal is said to crop out along the shore in such a position that it can be loaded into a steamship direct. Juneau operators are well pleased with the discovery.

PERSONALS

David Fleming, first resident superintendent of the Berwind-White mines, at Windber, Penn., after an absence of 15 years has returned to become the head of the Beacon shaft mine at Dunlo.

William J. von Bonies, mining engineer, of Louisville, Ky., formerly of Davies & von Bonies, engineers, of Louisville and Lexington, Ky., has given up that practice and accepted a position at Joplin, Mo.

James Matthews, president of the miners' organization in the vicinity of Shenandoah, Penn., has been presented with one of the pens used by Governor Brumbaugh in signing Senate bills Nos. 160 and 931, the approval of which acts brought the miners under the provisions of the Workmen's Compensation Law.

White L. Moss, of Pineville, Ky., has resigned his position as vice-president and general manager of the Continental Coal Corporation, whose operations are at Pineville and vicinity. The duties of the office were assumed by Maxwell S. Barker, of Louisville, Ky., chairman of the executive committee, pending the annual meeting held at Chattanooga, Tenn.

George Watkin Evans has been appointed to determine what areas of coal land shall be reserved by the government and what shall be thrown open to lease in Alaska. Mr. Evans is thoroughly familiar with both the Matanuska and Bering fields. While his name is mostly connected with the Matanuska field, owing to the fact that he was in charge of the government work in selecting and extracting the coal from this field to be tested to determine its availability for naval use he is even better acquainted with the Bering River coal field having been over the entire area many times.

OBITUARY

D. B. McClelland, vice-president, treasurer, and a director of Spang, Chalfant & Co., the Fayette Coal Co., and the Spang Land Co., died at his home in Pittsburgh on July 21.

James Elliott, of McAlester, Okla,, vice-president and general manager of the Haily-Ola Coal Co., of Hailyville, Okla., and receiver of the Great Western Coal & Coke Co., of Wilburton, Okla., and the Osage Coal & Mining Co., of Krebs, Okla., died recently.

J. W. Ganoe, a well-known merchant and coal operator died suddenly at his residence at Phillipston after returning from a convention of coal men at Buffalo, N. Y. Mr. Ganoe was 64 years of age, and a veteran of the Civil War. He is survived by his widow, four daughters, one son, two sisters and two brothers.

William H. Depew died at his home in Jermyn, Penn., recently, at the age of 66 years. Mr. Depew started work at the age of 16 years for John Jermyn, who owned the breaker known as Jermyn No. 1. This later became the property of the Delaware & Hudson Co., with which firm Mr. Depew remained after the transfer, becoming the head of the blacksmithing department for this company, which position he has held for the past several years.

Joseph R. Bailey, of Fairmont, W. Va., a former resident of Connellsville, was killed while crossing the railroad tracks at Rowlesburg, W. Va. Mr. Bailey came to Connellsville in 1900.

In 1907 he and W. G. McGinnis formed the Pittsburgh Steam Coal Co. and developed the Elizabeth mine. Later they purchased the Opekiska mine, of the Marietta-Stillwagon interests, holding it until about two years ago, when it was sold to the Connellsville Coal & Coke Co. Since then Mr. Bailey has been engaged in the coal and timber business in West Virginia.

RECENT COAL AND COKE PATENTS

Coke Oven. A. Roberts, Evanston, Ill. 1,132,685 Mar. 23, 1915. Filed Sept. 8, 1914. Serial No. 860,583.

Coal Device. D. Hilleman, St. Louis, Mo. 1,133,141 Mar. 23, 1915. Filed Apr. 7, 1914. Serial No. 830,275.

Mine Tipple Car. J. Cozilets, Coupon, Penn., 1,141,442, June 1, 1915, Filed July 14, 1913. Serial No. 778,967.

Miner's Safety Lamp. E. F. Koehler, Hudson, Mass. 1,132,522 Mar. 16, 1915. Filed Oct. 28, 1912. Serial No. 728,154.

Mechanical Stoker. J. E. Murphy, Winnipeg, Canada, 1,140,761, May 25, 1915. Filed Mar. 10, 1914. Serial No. 823,731.

Steam Boiler Furnace. C. E. Googins, Brooklyn, N. Y., 1,140,674, May 25, 1915. Filed June 15, 1914. Serial No. 845,134.

Coal Loading Machine. F. S. Converse, Binghamton, N. Y. 1,133,008 Mar. 23, 1915. Filed Aug. 10, 1914. Serial No. 856,023.

Mine Car Wheel and Axle. F. A. Sweet, Salt Lake City, Utah, 1,141,990, June 8, 1915. Filed Nov. 28, 1914. Serial No. 874,383.

Coal Washer. A. J. Sayers assignor to Link Belt Co., Chicago, Ill., 1,142,060, June 8, 1915. Filed Aug. 29, 1913. Serial No. 787,254.

Smoke Consumer. G. O'Neil, Moncton, New Brunswick, Canada. 1,131,944 Mar. 16, 1915. Filed Oct. 19, 1914. Serial No. 867,441.

Apparatus for Ejecting Ashes. W. S. Parsons, Ladywell, England. 1,131,951 Mar. 16, 1915. Filed Aug. 4, 1911. Serial No. 642,373.

Screening Conveyor. T. F. Webster assignor to Link Belt Co., Chicago, Ill., 1,142,060, June 8, 1915. Filed Jan. 27, 1912. Serial No. 673,708.

Miners Acetylene Gas Lamp. J. A. Gustafson, Idaho Springs, Colo., 1,142,699, June 8, 1915. Filed Aug. 29, 1914. Serial No. 859,259.

Coal Washing Apparatus. E. G. Burks, and N. Hayes, Birmingham, Ala. 1,132,422 Mar. 16, 1915. Filed July 3, 1914. Serial No. 848,985.

Mechanically Operated Grate for Furnaces. W. R. Wood, London, Eng., 1,141,226 June 1, 1915. Filed Nov. 28, 191 Serial No. 874,537.

Draft Regulator and Smoke Purifier. J. A. and M. L. McFerran, Louisville, Ky., 1,142,721, June 8, 1915. Filed Oct. 3 1914. Serial No. 869,463.

Mining Machine. F. L. Sessions, assignor to Jeffrey Mfg. Co., Columbus, Ohio. 1,132,800 Mar. 23, 1915. Filed Sept. 3, 1910. Serial No. 580,410.

Construction of Water Tube Boilers. R. Delaunay, Belleville, St. Denis, France. 1,132,458 Mar. 16, 1915. Filed July 20, 1914. Serial No. 852,077.

Water Tube Boiler. J. E. Bell, assignor to Babcock & Wilcox Co., New York, N. Y., 1,141,520, June 1, 1915. Filed Dec. 26, 1905. Serial No. 293,170.

Automatic Stoker. D. T. Williams assignor to Standard Stoker Co., Wilmington, Del., 1,142,293. June 8, 1915. Filed Oct. 29, 1913. Serial No. 798,009.

Mining Machine Car Truck. C. E. Davis assignor to Goodman Manufacturing Co., Chicago, Ill., 1,141,943, June 8, 1915. Filed Sept. 14, 1912. Serial No. 720,366.

Operating Device for Coke Oven Doors. C. V. McIntire, assignor to H. K. Koppers Co., Chicago, Ill., 1,141,132, June 1, 1915. Filed Dec. 8, 1913. Serial No. 805,216.

Mining Machine and Truck. E. R. Merrill, assignor to Jeffry Manufacturing Co., Columbus, Ohio, 1,142,348. June 8, 1915. Filed Sept. 12, 1910. Serial No. 581,489.

Coal Gas Generating Apparatus. H. A. Carpenter, assignor to Riter-Conley Mfg. Co., Pittsburgh, Penn., 1,140,798, May 25, 1915. Filed Jan. 2, 1915. Serial No. 118.

Gas Producer. E. A. W. Jeffries and G. H. Isley, assignors to Morgan Construction Co., Worcester, Mass., 1,142,100, June 8, 1915. Filed Mar. 2, 1908. Serial No. 418,656.

Baffle System for Stirling Boilers. D. S. Jacobus assignor to Babcock & Wilcox Co., Bayonne, N. J. 1,132,014 Mar. 16, 1915. Filed Aug. 12, 1913. Serial No. 784,313.

Furnace Stoker for Feeding Coal Dust or Other Comminuted Fuels. C. L. Heisler, Schenectady, N. Y., 1,140,817, May 25, 1915. Filed Jan. 20, 1913. Serial No. 743,202.

INDUSTRIAL NEWS

Garrison, W. Va.—The Roberts & Schaefer Co., of Chicago, Ill., recently closed a contract with the Webb Coal Mining Co. for the equipment of a Marcus patent coal tipple for immediate installation at Garrison.

Birmingham, Ala.—The United States Supreme Court in an action against the Louisville & Nashville, Nashville, Chattanooga & St. Louis, Tennessee Central and Illinois Central railroads has reduced rates on coal from Kentucky mines to Nashville from $1 to 80 cents.

Grafton, W. Va.—J. M. Shackelford, of Glenville, it is reported has sold all of his coal holdings in Gilmer and Braxton counties, consisting of about 2000 acres to Lloyd Beeghley and Andrew Admiston, both of Weston. The price paid is said to approximate $200,000. The coal is all of the Pittsburgh vein 8½ ft. thick.

Harrisburg, Penn.—The first monthly reports of coal production by the anthracite companies have reached the office of the Auditor General under the provisions of the tax act of 1915. At a recent conference of coal operators and state officials it was arranged that these reports should be as of the 20th of each month.

Harrisburg, Ill.—The Roberts & Schaefer Co., of Chicago, has been awarded a contract by Charles I. Pierce, president of the Saline County Coal Co. for the equipment of a Marcus patent coal tipple for installation in the Harrisburg, Ill. field. Also an order for the building of two modern bath houses at the mines at Harrisburg.

Portsmouth, N. H.—The entire Navy Yard fire department was recently called out to fight a stubborn fire in the forward bunkers of the United States auxiliary collier "Vulcan." The vessel carried approximately 12,000 tons of coal, 1000 tons of which it is believed have been destroyed. No material damage was done to the collier.

Billings, Mont.—Coal-bearing lands purchased in 1910 as grazing land for $2 per acre have been finally awarded to the purchasers, Yegen Brothers & Simonsen and their associates. The land is appraised by the government at $30 per acre, and is said to run rich in coal, but through some error, in the office at Washington, it was sold for $2 and the government has decided to issue the final certifications, thereby completing the sale.

Scranton, Penn.—The first real effect of the war on the labor situation has been noticeable recently, when 3000 Italian reservists employed in and about the collieries in this vicinity left the city on their way to Italy. The outlook is that quite an additional number will soon be on their way. Because of the dull times at the collieries the men are apparently taking advantage of the opportunity to get back home for a visit.

Rush Run, Ohio—Officials of the Beech Flats Coal Co. have been looking over their property in this section and it is believed anticipate making an important land deal. It is understood that this firm, together with the Blythe Coal Co. wishes to purchase three or four farms which adjoin the mining property of the two firms. As yet no deal has been consummated so far as is known. It is thought that part of this land will be stripped in order to secure the coal.

Whitesburg, Ky.—R. D. Baker, of Big Stone Gap, Va., and others are involved in an interesting coal and timber land litigation. Several years ago representatives of the Swift Coal & Timber Co. went into the Line Fork Creek section and purchased some 10,000 acres of coal and timber property. It developed that about 12 months before, R. D. Baker and others representing a Philadelphia corporation had taken options on the same property, the option still being good. A few weeks ago, the Swift Coal & Timber Co. began preparations to develop part of the holdings. Suit was then entered by Mr. Baker and others against this firm, claiming that they were the legal and proper owners. This is one of the largest coal and timber land litigations perhaps ever entered in eastern Kentucky.

Louisville, Ky.—Under a trust agreement filed with the Louisville Trust Co., holders of about $2,100,000 of bonds of the Continental Coal Corporation, are expected to acquiesce in payment of interest at the rate of 3 per cent. per year, instead of 6 per cent., for the next two years. According to M. S. Barker, chairman of the Executive Committee of the corporation, bondholders having about $900,000 of the bonds have sent in their consent already, while consent of 80 per cent. of the bondholders is required before the contract becomes effective. This much progress was made in 15 days and completion of the plan is thought to be likely. A semi-annual payment was due July 1, and this disbursement would be affected by the agreement. General depression of business is represented by the officers of the company as the reason for the temporary reduction. The bonds in question were issued in 1911.

Louisville, Ky.—First reviews of the forthcoming official report of C. J. Norwood, chief of the State Department of Mines, shows that 20,168,150 tons of commercial coal were mined in Kentucky in 1914, exceeding the output of the state during any previous year. The net increase is 743,968 tons over 1913, is explained by a big increase in production in Eastern Kentucky and in spite of a decrease in the production in western Kentucky, which showed a falling off of 664,242 tons. During the year there were 53 casualties in the mines of the state. The report also will show that the state had 270 companies operating a total of 364 mines at the end of 1914, located in 39 counties and employing from 32,000 to 33,000 miners. Prof. Norwood will urge the need of additional inspectors and states that he will call all present inspectors to a conference at Lexington, to consider means of making the best of the circumstances until the Legislature makes provision for more inspectors.

New York, N. Y.—Default having occurred in the payment of interest coupons due July 1, 1915 to the holders of Kanawha & Hocking Coal & Coke Co. 50-year first mortgage five per cent. sinking fund gold bonds issued under mortgage to Morton Trust Co., trustee, dated July 1, 1901, a committee has been formed to protect the interests of the bondholders. This committee is of an opinion that an effective demand should be made forthwith upon the companies which guaranteed the principal and interest of the bonds to make good the default of the interest payment and in order to do this bondholders are requested to deposit their holdings with the Bankers Trust Co., No. 16 Wall street. The committee consists of Daniel E. Pomeroy, chairman, vice-president, Bankers Trust Co.; Walker Buckner, vice-president, New York Life Insurance Co.; Lewis L. Clarke, president, American Exchange National Bank, and Stacy C. Richmond, of Winslow, Lanier & Co.

Columbus, Ohio—A gathering of railroad officials and Ohio coal operators, to the number of about 70, considered the question of coal rates from Ohio fields, at Columbus, on July 19 and 20. The conference was of an informal, friendly nature, to discuss the matter of raising the differential between Ohio and West Virginia. The operators held to their contention that under existing conditions there must be relief in the matter of rates or the bulk of the mines would have to remain idle. It was the belief of some of the railroad men that Ohio producers in some districts had allowed their markets to get away from them through suspension of operation, and that present troubles were due as much to labor as to rate conditions. A committee of 14, composed of railroad men and operators was appointed to present a scheme of action. Another conference will be held at Cleveland shortly when the committee is expected to make a partial report. Every mining district was represented on the committee, as were the following railroads: Hocking Valley, Baltimore & Ohio, New York Central lines, Pennsylvania lines, Wheeling & Lake Erie, and the Wabash-Pittsburgh Terminal. The railroads are suffering large loss of revenue through idleness of Ohio mines.

Coal Trade Reviews

General Review

Anthracite situation continues discouraging. Bituminous slow and export business erratic with competition more aggressive. Pittsburgh district firmer due to activity in steel. Full summer dullness prevails in Middle West.

Anthracite prices show no indication of bracing up, although some of the large companies are making an effort to increase operations which would indicate that they believe the dullest part of the year has passed. The individual companies are making heavy concessions on the circular, but they are finding the going hard, most purchasers preferring to deal with the large companies in order to strengthen their connection with them in anticipation of labor troubles next spring. In the meantime the current situation continues discouragingly dull. The storage capacity of the large companies is being taxed to the limit, while the independents are moving a tremendous volume of coal to Tidewater where stocks are already abnormal. The Lake movement continues to decline, and there are persistent rumors of a shortage of storage room at the upper ports.

There is a total absence of any spot demand in the bituminous market and the past week has been one of the worst of the summer. Practically the entire movement is being applied on contracts. Export business is erratic; the Hampton Roads piers are consistently breaking all records, while the movement out of Baltimore has taken a heavy slump and shipments generally are confined more closely to direct contracts while it is noted that a few options for export tonnage have not been taken up. Competition for this business is also becoming more keen, due to the complete lethargy in the general market.

Pittsburgh district operators are slightly firmer in their views as regards prices, due to the beneficial effects resulting from the increased operations at the steel mills. The bituminous movement is apparently increasing and with the large grain shipments now getting underway, it is likely that the pressure on the railroads may be of sufficient proportions to affect the trade. The Lake trade continues discouraging, the only cheerful feature being the possibility of an increase in the August movement.

Generally negative conditions still prevail in the Ohio market. The harvesting of the largest crop in the history of the state is not relieving the pressure in any way although it may help some when the rail movement starts. Industrial conditions are slightly better than during the first half of the year, but this is offset by the extreme caution on the part of the buyers. The stocking season is much behind, and all attempts to force action in this line have met with little success.

The full mid-summer dullness prevails in the Middle Western market, but prices are running somewhat higher than last year, due to the careful restriction in shipments. Intermittent buying of screenings by the large consumers has caused a relapse in this branch. General commercial conditions show some improvement but this is offset by the extreme conservatism in the coal business which is further accentuated by the backwardness in the crops. Heavy war orders continue the most encouraging feature of the market.

A Year Ago—Anthracite trade touches the low point of the year. Firmer tone and improved sentiment in bituminous. Stocks exhausted and buyers finding they have overstayed the market.

BUSINESS OPINIONS

Boston News Bureau—If the new strength of war stocks foreshadows the closing up of additional business, then the market is in a position to receive a fresh impetus, but otherwise an unhealthy situation prevails. The international situation is bound to hang fire for several weeks. In the meantime the index to industrial conditions is best furnished by the heavy advances in the prices of steel products along with tremendous bookings. These tell their own story.

Modern Miller—A very small percentage of winter wheat crop was threshed this week. In a few favored localities threshers were able to work, but in general the wheat is still standing or in the shock drying out. More activity is expected next week. Rain has fallen in Nebraska, Kansas, northern Oklahoma, northern and southeastern Missouri and Ohio. In Illinois, Indiana and Kentucky the crops are rapidly drying out.

Iron and Steel—The speculative orgy in the market for steel stocks has attracted more attention than the improvements at the steel mills, which is noteworthy. The leading interest is operating about 93% of its ingot capacity, compared with 91% a week ago, and some of the independent mills are now at full rated capacity. It is estimated that at least 25% of current operations are for war orders or the like. There is an unusual program of new steel-plant construction projected in and around the Youngstown district. Prices of billets have again advanced, and on some special commodities prices are unusually high. The activity of the steel mills is so great that the situation in ferro manganese promises again to become acute. Activity in the machine-tool industry continues on just as large a scale as ever.

Southern Lumberman — Enlarged activity in industrial lines, settlement of certain local labor trobules with continued absorption of idle working men, further heavy war orders, increase in bank clearings, and the good crop outlook, are all contributing factors.

American Wool and Cotton Reporter—Manufacturers are cheerful over the openings on lightweight goods. The turning point in the market has arrived, it is felt by some. Prices of goods at the openings were based on present market prices for wool. The goods opened at higher prices than a year ago, and a fair volume of sales was consummated.

Dun's—Apart from the development of further labor controversies, the general situation maintains its favorable aspects. Recent settlement of labor troubles in the building trades in the West has been followed by the adjustment of the local clothing strike, but fresh disturbances have arisen here and elsewhere, notably at oil plants in New Jersey.

Marshall Field & Co.—Although weather conditions have not been conducive to normal retail selling throughout the country, the volume of current wholesale distribution has about equaled that of the same period last year. Fewer merchants have visited the market than a year ago.

Bradstreet's—Growing activity in industrial quarters turning out metals and their products, prospects of big crops, optimistic sentiments as to the future, and better collections, contrast with midsummer quiet in the larger merchandising lines, unrest in labor circles, some conservatism, generated by international political matters, and quite slow buying for fall account.

ATLANTIC SEABOARD

BOSTON

Prices on Hampton Roads coals practically unchanged. Export trade still spotty and coastwise market drags. Georges Creek now in plentiful supply. Pennsylvania grades dull and anthracite very quiet.

Bituminous—No improvement can be reported in the market for Pocahontas and New River. There has been no price movement of any kind and those shippers who were offering concessions a week ago are doing so today. Receipts here are about normal but practically every ton arriving is being applied to contract purchases and not being absorbed by any spot market. The latter simply does not exist. It is a good sign that so little coal is being forced on this territory and it gives reason to hope that if things do start up in the fall there will be room here and there for coal. The fact that the trade is in no worse shape than when last reported is also ground for encouragement.

Agents who distribute coal for inland delivery from Tidewater points are still selling at minimum prices. There is much rivalry for this trade in the larger ports like Boston, Providence and Portland, and it is believed that some of those who have rehandling plants of their own are seeking in this way to discourage competition on the part of shippers who must use the facilities offered by the railroads.

While the volume of coal moving off-shore is still large, it is mostly on old sales. New business is not coming in with quite the push it had earlier in the season.

Georges Creek is now in ample supply at all points and contractors in New England are beginning to get their full share of this popular grade. If the off-shore demand improves as it is almost certain to do later on it is likely that Georges Creek will again be in arrears in the coastwise trade.

With the Pennsylvania grades trade is also in a dull state. While for some weeks the quality coals had all the business wanted, the operators are now again looking for orders.

Water Freights—There is little to add to last week's report. Rates depend on conditions that change almost daily. There is a surprising amount of rechartering: i.e., shippers who have tonnage under charter are in several cases turning over barges to other shippers at current market rates; 40c. is still the minimum freight on small barges, New York to Long Island Sound ports like Providence and New Bedford.

Anthracite—July business this year is somewhat ahead of 1914, but there is no life to the demand. The last week of the month is usually less dull and while little is said it is realized that July will stand up pretty well for tonnage, considering we are now in the midst of summer dullness.

Prices on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.40@2.85	2.92@3.02

Boston†	....	....	....	3.55@3.68
Providence†	....	....	....	3.45@3.68

* F.o.b. †On cars.

NEW YORK

Bituminous contract coals moving freely. Spot market quiet. Good demand for export and bunker fuels. Anthracite situation dull. No demand at Tidewater.

Bituminous—Contract coals continue to move freely but shippers report practically no spot demand. Demand for export and bunker coals remains fairly active. New inquiries are being received from France, Spain and Italy and some contracts are reported as having been closed. The end of the month should see as large if not larger export tonnage than in June.

Production in the Pennsylvania regions has been at about half capacity. The local situation shows no improvement. There is a great quantity of unsold coal at the docks while the harbor contains many filled bottoms. Some of the cheaper grades can be bought at about $2.35 f.o.b., fair grades at 15c. more, while the choice grades are quoted at $2.65 to $2.80. Some of the larger New York companies with Philadelphia connections have received inquiries from foreign countries and are preparing to make shipments.

Current quotations are on the following basis·

	South Amboy	Port Reading	St. George	Mine Price

Western Maryland	....	2.35@2.40	2.35@2.40	.80@ .85

Anthracite—With the passing of the two dullest months of the year, handlers of anthracite coal are looking forward to increased business. A reflection of this optimism may be seen in the efforts of a couple of the large companies to operate their mines six days this week. So far demand has not increased at tidewater and there was not the customary rush of orders during the last week of the month to save the discount.

Shippers are disposing of much coal inland and the Lake trade is calling for regular shipments. The Tidewater docks are well loaded and the number of filled bottoms about the harbor has not decreased. Independent miners continue to send all their surplus coal to Tidewater. The companies are reported as storing considerable of their product.

Concessions continue to be made on some of the prepared sizes. The average price on individual coal has made no material change in several weeks. Occasionally a bargain can be picked up at lower figures than the average quotation.

The steam-size situation is practically at a standstill. There is any quantity of the buckwheat coals on hand. The better grades of Nos. 2 and 3 are very scarce. Pea coal is being stocked.

Current quotations follow:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.85		$4.90

Barley	1.75@2.00	1.45@1.70	1.80@2.05	1.50@1.75

PHILADELPHIA

Anthracite shows slight improvement, although extreme dullness continues. Nut size remains a burden, with stove the most active. Pea moving fairly well, but other steam sizes are weak. Bituminous has the poorest week of the year.

Anthracite—While there has been a very slight improvement, the trade shows no real prospect of bracing for some weeks yet. This is the dullest season of the year and most dealers are only buying to meet actual needs, although some continue to stock up because of the extremely low prices.

This is particularly true of pea; several dealers continue to buy heavily of this size, taking the stand that they can make a larger margin of profit at the existing prices with less capital invested, than if they put their cash in the domestic grades. Plenty of pea is still moving at $1.50 and there is no trouble at all to buy first grade coal at $1.75.

Chestnut continues to be the real drug of the market, with egg and stove the most active. A large sale of this latter size has been reported at April circular, but this reduction was made on account of carrying a good tonnage of chestnut with it. Chestnut has been freely offered in several instances at 10c. off April circular. The general price fluctuations are from 10c. below April circular to 10c. below current circular for the family sizes.

Collections continue to be a great source of worry, both to the operator and the dealer, and some of the dealers who are urged to take in coal at attractive prices state that they cannot collect enough money to even pay the freight. The steam sizes continue to follow in the trend of the other low prices and can readily be bought at from 10c. to 25c. off the circular. However, the small steam users who have been accustomed to buy their fuel as needed at the prevailing market prices are becoming a little uneasy over the labor outlook and are asking for contracts. Even with offerings at extremely low prices, many of the dealers are declining to buy from the individuals, placing what few orders they have with the larger companies, whom experience has taught them can take care of them in times of trouble in the mining region.

Reports are coming in daily from the mining regions that the men are prepared for the strongest fight—should it come to that—they have ever made. A suspension of two months would benefit the business, as such a condition would enable the market to right itself as to the extremely low prices that have been prevailing for a long time.

The prices ruling the past week, to which should be added the state tax of 2½% per ton, are as follows:

	City	Tide		City	Tide
Broken	$3.20	$4.45	Pea	$2.50	$3.25
Egg	3.45	4.70	Buckwheat	1.25	2.25
Stove	3.70	4.70	Rice	.85	1.75
Chestnut	3.85	4.95	Barley	.50	1.50

Bituminous—The bituminous trade has probably experienced its worst week so far this summer. Mines are on very short time, with practically no demand except on contracts. This continued inactivity of the domestic market has led some of the operators who have never touched export trade to inquire into the possibilities of that line, and it is altogether likely that there will be stronger competition for this trade in the future. The tide shipments this week have continued in good volume to both European and South American ports and the prospects are that the tonnage will continue to increase, although the lack of vessels continues to be more than ever a serious question.

The prevailing prices are as follows:

Georges Creek Big Vein	$1.65@1.75	Fairmont gas, mine-run	$1.15@1.25
South Fork Miller Vein	1.50@1.60	Fairmont gas, slack	.65@ .75
Clearfield (ordinary)	1.00@1.20	Fairmont lump, ordinary	.85@ .95
Somerset (ordinary)	1.00@1.15	Fairmont mine-run	.75@ .85
West Va. Freeport	.85@ .95	Fairmont slack	.45@ .50

BALTIMORE

Falling off in export movement but large movement expected later. Market remains soft, and prices low.

The feature of the coal trade during the past ten days has been the falling off in the export movement. This became rather pronounced the first week of this month but the following two weeks showed somewhat of a gain, although much below the same period of June. Last week saw another slump, and the outlook is probable that only about 200,000 tons will be moved from Baltimore to foreign ports this month; this is a loss of about 100,000 tons from the previous month. Call for bunker fuels is becoming heavier all the time, however, and the tonnage for July will run between 55,000 and 60,000 tons.

Many charters for loading the next 60 days or so are being made, however, and there are some who believe that a new record for foreign shipment will be made during that period.

The domestic trade remains dull, despite talk of activity among firms making war orders. Coal is offering very cheap at the mines. While better grades are moderately firm in Maryland, West Virginia and Pennsylvania at from $1.10 to $1.40, poor to ordinary fuels can be bought at 75 to 85c.

HAMPTON ROADS

Export shipments continue heavy, particularly to Italy. Trial shipments of high volatiles to South American ports.

Coal shipments from Tidewater continue heavy to Italy with a few shipments to South American ports. There is still some shortage of New River and Pocahontas and few shippers are accepting prompt orders. The coastwise movement has been mostly to New England ports although some small shipments have gone to Savannah, Jacksonville and Charleston. Prices on all of the standard grades of New River and Pocahontas remain about at the circular, although there is some shortage.

In addition to the smokeless coals going foreign there has also been some small shipments of high volatile grades to South American ports; these, however, have been more in the nature of trial parcels with a view to introducing American gas coals and it is not believed any large movement can be expected as yet for this coal. The outlook still continues bright for a record month for July, and unless vessel tonnage now due is delayed the coming week's dumpings should be one of the heaviest of the month.

Railroad Tonnages—Dumpings over the local piers for the past several weeks compare as follows:

	Week Ending				
Railroad	June 26	July 3	July 10	July 17	July 24
Norfolk & Western....	213,279	211,017	174,822	180,090	197,913

Totals............	380,989	291,828	308,686	375,662	......

VESSEL CLEARANCES

The following steamers have cleared from Hampton Roads July 16 to 23, 1915:

Norfolk

Vessel	Destination	Tons
Berwind	San Juan, P.R.	3015
Vinland	Rio	5477
Queen Helena	Santa Liberata	5900
Ocland	Cristobal	4800
Tordenskjold[1]	Cristobal	5500
Mariorga Goulandris	Spezia	5186
Gemma	Genoa	4470
Clara A. Davis	Maceio, Brazil	1096
Andrea	Savona	5000
Eleanora Maersk	Copenhagen	2677
Polynesia	Leghorn	2633
Luigi Ciampa	Civita Vecchia	5000
Sava (bark)	Naples	1641
Harald	Curacao	4500
Wm. E. Litchfield	Puerto Plata	736
Ellen S. Little	Pernambuco	2000
Torrington	Genoa	7500
Florence Howard	Pernambuco	1318
M. D. Cressey	Bahia	2975
Hornelen	Buenos Aires	4930

Newport News

Vessel	Destination	Tons
Rhydiven[2]	Taranto	6700
Campeiro	Maddelena	4400
Nolisment	Genoa	7500
Dorington Court	Spezia	7000
Magnus Manson	Pernambuco	2410
Apsleyhall		6300
Verdun	Rio de Janeiro	7200
Malm	St. Jago	1700
Hackensack	Tiburon	3200
Panaghi Vagliano	Italy	4200

Note—Steamers are indicated by **bold face** type, others being barks and schooners.

[1] Smokeless Fuel Co. [2] Berwind-White C. M. Co.

The following vessels cleared with coal from New York Harbor during the week ended July 21:

Vessel	Destination	Tons
Matura	Port of Spain	140
Geo. B. Cluett	St. Anthony	87
L. P. Whitmore	St. John	438
Siberia	Frontera	50
Timandria	Rio de Janeiro	455
Francis Sawyer	St. John	598
Jost	Yarmouth	350

Note—Steamers are indicated by **bold face** type, all others being schooners.

Clearances for foreign ports from Baltimore for the week ending July 24 were as follows:

Vessel	Destination	Tons
Andrea Costa	Italy	4,885
Driebergen	Cuba	2,802
Oceano	Italy	5,777
Urubamba	Peru	146
St. Dimitrios	Greece	5,220
Styliani Bebis	Italy	5,514
Drammensfjord	Norway	2,907
Cleanthis	Italy	4,738
Totals		31,989

OCEAN CHARTERS

[1] July and Aug. [2] Or Baltimore. [3] Option Buenos Aires or La Plata $8.28 Aug.

Note—Steamers are indicated by **bold face type,** all others being schooners.

OCEAN FREIGHTS

The number of steamers available for coal has decreased materially and the freight market is considerably firmer, owing to the increased demand for steamers for grain. Owners are not willing to accept shippers' views on these grain freights, but shippers are advancing their ideas, and probably a number of steamers will be chartered for grain in the near future.

This grain demand makes it difficult to quote probable freight rates on Mediterranean coal with any degree of certainty. We would quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana...............	$2.00@2.25	Bermuda..............	**$3 00**
Cardenas or Sagua......	**2.75@3.00**	Vera Cruz.............	3.25@3.75
Cienfuegos............	2.75@3.25	Tampico..............	3.25@3.75
Port au Spain, Trinidad.	3.50	Rio..................	8.40@8.64
St. Lucia..............	**3.25@3.50**	Santos*..............	8.40@8.88
St. Thomas............	3.00	Montevideo...........	8.22@8.34
Barbados...............	**3.50**	Buenos Aires or La Plata	8.28@8.40
Kingston..............	2.75@3.00	Rosario..............	8.64@8.88
Curacao...............	3.25	West Coast of Italy.....	8.88@9.60
Santiago..............	2.50@3.00	Barcelona**...........	8.16@8.64
Guantanamo...........	2.50@3.00	Valparaiso or Callao....	6.25@6.50
Demerara..............	**4.25@4.50**	Marseilles............	8.64@9.12

Note—Rates noted in **bold face** type are only approximate.
* Consignees paying dockage dues. **Spanish dues for account.
W. W. Battie & Co.'s Coal Trade Freight Report.

Note—Charters for Italy, France and Spain read: "Lay days to commence on steamer's arrival at or off port of discharge. 24c. per net register ton per day demurrage."

LAKE MARKETS

PITTSBURGH

Manufacturing demand increased. More export demand for Connellsville. Prices a shade firmer. Operations at 50 to 55% of capacity.

There has been a further improvement in demand for coal from manufacturers, particularly in the iron and steel industry, which is now operating at more than 90% of capacity, in the case of western Pennsylvania and eastern Ohio, though the steel industry as a whole is operating at somewhat under 90%. The increased demand noted is almost wholly on contracts and does not operate to stiffen the market materially.

The demand for Connellsville coal for export has increased and operators who have participated in this trade of late are somewhat firmer in their views as to prices. Shipments in the Lake trade continue light and altogether unsatisfactory, but in some quarters predictions are made that August will show a material improvement. As a result of heavier manufacturing demand and light Lake shipments slack is a shade stiffer, and Youghiogheny gas slack readily brings 55c., slack from other divisions going at about 50c. Mining operations in the district are at 50 to 55% of capacity.

While prices are not quotably changed except on slack the market seems to be firmer all around, at the following levels for prompt coal: Slack, 50@55c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. On contract to Apr. 1 the market on mine-run seems to be from $1.05 to $1.15.

BUFFALO

Increased activity in bituminous and still more anticipated soon. Price advances will be slow as the natural output is large and all operators are eager to increase their trade. No improvement yet in anthracite.

Bituminous—The volume of bituminous moving appears to be steadily increasing and there should be a constant improvement from now until fall. Grain will soon begin to move and it is expected that there will be enough demand on the railroads to affect coal. There is no better call for slack, but there are not quite so many reports of cut prices and the general improvement is no doubt helping it some.

The Canadian situation is not materially improved; in fact the latest report from there notes the shutdown of a mill that had for a long time bought coal in considerable quantity here. The additional tariff, the reduction in the price of Canadian coal and the lessened consumption, all contribute to cutting down sales in that direction. Prices continue on the basis of $2.70 for best Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack, with slack less firm than sizes.

Anthracite—The demand does not improve. All branches of the trade appear to be dull now, so that the mines have no other alternative than to run slow and they are turning out less coal than for a long time. There is a fairly good report from some of the independent mines. By making an extra effort to push their coal on the road and by preparing it as well as they can, they are able to keep running. If they can do that now they should do a fair trade till the fall demand sets in.

There is considerable dropping off in Lake shipments which, till within a week or two, had kept up well. There is report that storage space is short at the receiving ports. The vessels have loaded only 80,900 tons here during the past week.

TOLEDO

Pocahontas supply still less than the demand and prices are holding to list. Domestic and steam grades slow. Lake movement still light.

A little stronger Lake market and other lines at a standstill are the salient features of the local market. Domestic trade is slow and even the anthracite movement is extremely light in spite of the fact that this is the period when contract coal is usually being put in. The threshing season is now on full with one of the biggest crops known in this section, but the additional demand has scarcely been noticed.

Kentucky coal seems to have held up as well as anything in the domestic lines. Anthracite is selling off the circular, which is an unheard of situation at this point. West Virginia prices are so low that they are moving the best; Pocahontas No. 3 is the exception this grade holding at full list prices. The Lake shipments are holding up well and there was a little spurt during the past week due to the regular August increase in the circular. There is little demand for smokeless coal outside of the Pocahontas grades and the situation is generally weak. Little Youghiogheny is sold on this market and Pittsburgh No. 8 is going at the buyers' price.

COLUMBUS

Production shows no increase and conditions are generally unsatisfactory. Buyers cautious and a reaction in prices seems imminent. Lake movement a big disappointment.

Efforts to force the backward stocking season are not meeting with much success in the case of the domestic coals. Production in Ohio fields has increased little, if any. West Virginia and Kentucky operators also, find conditions very unsatisfactory in this market. Under these circumstances there is considerable sacrifice of prices.

There is a slightly better feeling in the steam trade most factories working better time than during the first half of the year. This is offset in a measure by the cautious buying of public service plants and other large consumers, particularly in the matter of fine coal. The opinion is generally held that prices, which have so far been well maintained are going to break in the near future. The production of domestic lump will be much increased shortly, owing to limited stocking up to the present time, and this will create a surplus of screenings. Absence of any large Lake shipments either in the Hocking Valley or Eastern Ohio has been a big factor in holding up West Virginia nut, pea and slack to from 15 to 20c. above normal.

It now seems almost a certainty that the Hocking valley will have no Lake season in the real sense of the word. Beginning at about this date last year, when the new mining scale was signed, about 600,000 tons were sent to the docks before navigation closed. The dock movement at Toledo is slow. During the week ending July 19 but 51,069 tons were handled. The total tonnage for the season up to that date is 961,462. Slow movement by rail to the interior in the Northwest still keeps the upper docks in a congested condition.

Prices in Ohio fields are:

	Hocking	Pomeroy	Kanawha
Rescreened lump	$1.50	$1.60	.....
Inch and a quarter	1.35	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine run	1.10	1.10	1.05
Nut, pea and slack	.70	.75	.65
Coarse slack	.60	.70	.55

Mines have been working at about the following percentages of full capacity.

District	Week Ended July 3	July 10	July 17	July 24	District	Week Ended July 3	July 10	July 17	July 24
Hocking	25	20	25	25	Cambridge	20	25	35	25
Jackson	25	15	25	20	Masillon	15	25	30	25
Pomeroy	30	45	40	40	Eastern O.	40	60	50	55
Crooksville	55	30	20	20	Average	30	31	32	30

CINCINNATI

Improving demand for prepared grades, especially for the Lake ports, but steam business is still slow, with virtually no market.

A slightly improved domestic market is noted and the Lake movement is also picking up quite perceptibly. The certainty of a normal domestic consumption is moving the coal ,although the volume is restricted. The market, however, is still very far from normal. The increased production of screenings resulting from the domestic improvement has weakened the steam market still further and heavy price concessions are noted both on contract and spot coal. While the machine-tool and related lines are running overtime, as a result of war orders, few other manufacturers have much to do.

CLEVELAND

Coal receipts increased somewhat, but prices continue firm and slightly stronger on fine coal. Retailers book orders for number of orders ahead.

Receipts of coal are larger than at the opening of last week, but the demand pretty well cleaned up the market Monday. Pittsburgh coal brought $1.55 and Youghiogheny as high as $1.65. Sales for shipment are being made at slightly better prices, and the demand for fine coal seems to be growing. The large steam consumers who have been dependent upon orders for war materials are continuing to take as much fuel as they have been and manufacturers of lines not sold as war material are taking a little more coal.

The demand for coarse coals continues light. The market has been cleaned up and the low priced Ohio No. 8 that was offered a week ago has disappeared. There is some West Virginia No. 8 at $1.80 for three quarter, but not enough to disturb prices.

The Lake business shows no change; it will be three weeks at least before it begins to increase.

Retail dealers are booking considerable business, but the delivery is being delayed as customers are not taking the coal. There seems to be no hurry to take coal that commands a discount for delivery and payment prior to Sept. 1.

Quotations for shipment are:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	Ohio No. 8
Lump	$3.45	......	......	....	......
Lump, ¾ in.	.....	$2.15	$1.90	$1.85@1.90	$1.85@1.90
Egg	3.45	......	......	....	......
Mine run	2.65	2.05@2.10	1.80	1.80	1.75@1.85
Slack	......	1.60	1.55	1.55	1.55

LOUISVILLE

Mine operations continue much curtailed. Substantial cut in retail prices being considered.

Negative conditions continue in the Kentucky coal trade, with little or no improvement in any direction. Mines in Eastern Kentucky are reported to be averaging from two to three days a week, while those in the western part of the state are making about a day less. The demand from the cotton seed crushing mills in the South is developing, but the ice factory trade throughout the whole section is less than normal. The retail stocking, movement is not a big item, as yet, and it is stated that a sharp reduction in the retail price is to be made.

Prices, f.o.b. mines are based on from $1.35 to $1.90 for block, while nut and slack range 30 to 40c. and 50 to 60c. according to grade. Western Kentucky screenings are to be had in considerable quantities.

COKE

CONNELLSVILLE

Better outlook, additional merchant furnaces being expected to blow in, and quotations are stiffer. Production and shipments approximately the same as at the beginning of the month.

Prospects have improved for an increased demand for furnace coke as the pig-iron market has taken such a turn as to suggest that several additional furnaces will soon blow in. Ella furnace at West Middlesex, controlled by Pickands Mather & Co., is expected to blow in early in August, while the third of the Shenango furnaces is likely to go in at about the same time.

An Eastern consumer has contracted for 6500 tons of furnace coke a month for three months, the price being in the neighborhood of $1.75. For longer delivery periods the operators are disposed to quote on a sliding scale basis, depending on the price month by month of basic pig iron at valley furnaces. Spot furnace coke has stiffened again as shipments on contracts are somewhat better and there is little free coke available. We quote: Prompt furnace, $1.70; contract furnace to Oct. 1, $1.75; contract furnace to Jan. 1, $2; prompt foundry, $2.25@2.40; contract foundry, $2.25@2.60, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ending July 17 at 371,144 tons, an increase of 30,402 tons, and shipments at 365,615 tons, an increase of 35,542 tons. The increases represent the recovery after the holiday week.

Buffalo—There is some advance in the price of coke, though it does not appear to have materialized in this market to any great extent. So long as steel continues to do well there will be a liberal output of coke, though prices may not be very strong. There is frequent report of new ovens firing up, which shows confidence in the market, though it is easy to overdo it. Quotations are stronger on the basis of $4.25 for best Connellsville foundry and $3.30 for stock coke.

Chicago—Coke prices have shown somewhat of a tendency to stiffen during the past week, with the greatest strength in foundry sizes. Byproduct sizes are in better demand, and prices have steadied. Quotations are as follows: Byproduct, $4.55@5.10; Connellsville, $4.75@5; Wise County, $4.65; gas coke, $3.75@3.90, furnace, $4.65@4.75.

MIDDLE WESTERN

GENERAL REVIEW

Demand quiet with prices fairly well maintained. Screenings slightly softer. Anthracite still backward.

Midsummer dullness has prevailed this week, and the expected revival of buying over the month end has not materialized. There is but little spot coal on tracks. Shipments to the country districts have not been so large as expected, due to the backwardness in the crops. General commercial conditions show betterment, but extreme conservatism prevails in the retail trade and among large industrial buyers.

Prices are holding firm because of the close restriction of shipments, although some operators state that current quotations do not allow them sufficient margin to show a reasonable profit. Nevertheless, it is admitted that prevailing prices are better than they were at this time last year. It is anticipated that August orders will be larger and at better prices, because of the small shipments thus far. The movement of Lake coal has increased during the past two weeks.

CHICAGO

Market somewhat heavier and prices lower. West Virginia grades continue the leaders. Anthracite unusually weak.

Franklin and Williamson County domestic shipments have been smaller this week, and it is reported that some coal has gone forward at from 10c. to 15c. per ton under circular prices, although generally the $1.50 price is maintained. Saline County domestic lump usually sells at $1.35, but an increasing number of shipments are noted from Williamson County at $1.25. Most of the screenings from Southern Illinois mines have been averaging 75c. per ton.

In the Springfield district orders for domestic lump have been very slow, although the operators are endeavoring to maintain the $1.50 price. It is reported that a number of sales have been made at 25c. under this figure during the past week. Screenings from the Springfield district have been steady at around 70c.

The output of Indiana domestic coals has increased slightly. Industrial shipments from the Indiana mines show little betterment, but the operators are confident that the fall trade will bring a decided revival in this class of business. The demand for Fourth Vein Indiana coal has been steady at fair prices, while Fifth and Sixth Vein grades have been very quiet. Some shipments for threshing trade have been moving to Iowa and Northwestern points.

Prepared sizes of Pocahontas and West Virginia smokeless coals continue strong, egg coal being easier than the others. Mine-run has stiffened, and most of this grade is selling at $1.25. Splint coals show no improvement, and prices quoted show a wide range. Splint nut and slack has been as low as 45c. per ton, f.o.b. cars at the mines for spot shipment.

The Pennsylvania smokeless demand has receded, but there is no demurrage coal to be absorbed. The demand for egg and nut has been very slow.

The circular price for Hocking lump is $1.50, but to meet the strong competition from West Virginia and Kentucky coals, shipments have been going forward at an average discount of 25c.

Kentucky grades are still in a bad way. The demand for Kentucky block has been more active, but there is practically no movement of other sizes.

Anthracite is fully as backward as bituminous grades. Lake shipments have declined in volume, being much less than for several weeks past. Shipments to far Western points have been made this week at discounts of from 25c. to 35c.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.
Lump......	$1.35@1.50	$1.25@1.50	$1.35@1.50	$1.25@1.50	$1.40@1.50

INDIANAPOLIS

Screenings are lower, the supply exceeding the demand temporarily. Retailers more active. Steel and related industries very busy and consuming large quantities of coal.

An easing off in the price for screenings is the only feature of interest in the Indiana coal industry. Nos. 5 and 6 are now selling at 65 to 70c. Operators are unable to account for this, though the cause apparently lies in Chicago. The buying there is not constant and if big purchasers stay out of the market for a few days, the effect is immediately noticeable. During these periods, the supply exceeds the demand and some sellers, alarmed by the surplus, are tempted to make concessions.

The demand for domestic lump is slightly better, the retail yards having been forced to replenish supplies. The movement as yet to the railroads has not shown the acceleration due to crop-marketing times, as yet the weather having been a delaying factor. The activity at Gary, Kokomo, Anderson and other cities where there are steel manufactories has increased. At Kokomo, where the auto factories are working on war, as well as domestic business, the factory buildings are not adequate and tents have been erected. Retailers report an increasing movement to consumers' bins.

ST. LOUIS

Some domestic coming in but screenings continue to drag. Mt. Olive mines suspend operations for 30 days.

Domestic orders are beginning to come in for lump and egg coal, cutting off the demand for nut, which has become a drug on the market. Screenings are still at the bottom of the price list for some unexplained reason. The Mt. Olive mines are closed down for thirty days and consumers of this grade are being supplied with Staunton coal. There have been numerous changes in prices during the past week and quotations are now as follows:

	Wilm. & Frnk. Co.	Sparta	Mt. Olive	Standard
6-in. lump	$1.25@1.35	$1.25	$1.25@1.35	$0.95

KANSAS CITY

The retail market has shown very little activity during the past week, though it has picked up to a slight extent. It is understood that prices will be advanced on the first of August. The wholesale market has been slightly better and retailers are pushing strong for business by energeticly advertising their product.

Prices for July delivery are as follows:

Bonanza smokeless (semi-anthracite)	$6.00	Penn. anth. (furnace)	$10.50
Cherokee lump	4.25	Penn. anth. (stove)	11.00
Cherokee nut	4.00	Arkansas anth. (furnace)	8.00
Missouri block	4.00	Arkansas anth. (stove)	8.50

PRODUCTION AND TRANSPORTATION STATISTICS

IMPORTS AND EXPORTS

The following is a comparative statement of coal imports and exports of the United States for May, 1914-15, and for the eleven months ending April, 1913-14-15, in long tons:

	May		Eleven Months		
Imports from:	1914	1915	1913	1914	1915
United Kingdom	551	957	8,750	10,684	33,919

Williamson & Pond Creek	48,052	55,311	84,086	75,573
All other railroads	129,446	195,845	251,339	282,790
Grand total	1,904,752	2,200,551	2,434,614	2,680,465

BALTIMORE & OHIO

The following is a statement of coal and coke tonnage moved over this system and affiliated lines during June and the previous two months:

	April		May		June	
	1915	1914	1915	1914	1915	1914
Coal	2,159,914	2,131,812	2,564,481	2,357,119	2,883,959	2,380,795
Coke	289,369	343,962	297,897	301,163	329,130	298,237
Total	2,449,283	2,475,774	2,862,378	2,658,282	3,213,089	2,679,032

I. C. C. Decisions

I. C. C. Nos. 5919, 5920—Alpha Portland Cement Co. vs. Baltimore & Ohio R.R. Co., et al. Baltimore & Ohio R.R. Co., et al. vs. Pennsylvania R.R. Co

1. Rate of $2 per gross ton for the transportation of bituminous slack coal in carloads to Martins Creek, Penn., from mines in the Fairmont region of West Virginia and in the Westmoreland region of Pennsylvania, not found to be unreasonable or unjustly discriminatory.

2. The requirement of a differential between slack and other sizes of bituminous coal not found to be justified.

I. C. C. No. 6796—San Toy Coal Co. vs. Akron, Canton & Youngstown Ry. Co., et al.

1. Complainant attacks as unreasonable and unduly discriminatory defendants' rates on bituminous coal in carloads from San Toy, Ohio, and other points in the Crooksville, Ohio, coal district to Chicago, Ill., and to points in the states of Illinois, Indiana, and Michigan. Upon the facts disclosed of record: **Held,** That the rates unjustly discriminate against shipments from mines of complainant and others located in the same district in favor of mines located in the middle district of Ohio. Defendants required to remove the discrimination.

2. Complaint is also made of rates from San Toy and other points in the Crooksville district to Lake Erie ports for transshipment; **Held,** That the evidence fails to show that the rates complained of are unreasonable or otherwise in violation of law.

I. C. C. No. 6271, Monroe Coal Co. et al. vs. Chicago & Eastern Illinois Ry. Co. et al.

Rate of 87c. per ton on coal to Chicago from mines in the Sullivan-Linton group of Indiana found not to be unduly discriminatory as compared with the rate of 77c. applicable to the same destination from mines in the Brazil-Clinton district of Indiana. (For a detail analysis of the Illinois and Indiana freight rates see p. 1056 of Vol. 7.)

I. C. C. No. 7408—Reeves Coal Co., vs. Pere Marquette R.R. Co., et al.

A shipment of bituminous coal en route from La Follette, Tenn., to Vermilion, S. Dak., was ordered reconsigned to Ghent, Minn. Defendants failed to effect the reconsignment, and higher charges were collected than would have accrued if complainant's instructions had been followed. Reparation awarded.

FOREIGN MARKETS

GREAT BRITAIN

July 16—The two important events of the week in the coal industry have been the issue of the text of the new Price of Coal (Limitation) Bill, which has naturally been freely and widely discussed, and the strike of the miners in South Wales. Both have interfered with business materially. With regard to the former, the announcement in the House of Commons yesterday disposes of the controversy as to whether the Bill applies to coal not yet delivered under existing contracts. It does not. Contracts made before the passing of the Act are unaffected by it. As for the strike in South Wales, a speedy resumption of work is expected, but it is pointed out that should the men prove deaf to the appeals of patriotism and reason the Government, while unable to punish thousands in any other way might lay an embargo upon the funds of the unions, and make it penal to either distribute or receive money which there is reason to believe is to be used for strike pay. The stoppage of supplies should prove a potent check to the strikers if such action becomes necessary.—"The Iron & Coal Trades Review."

July 16—The whole of the Welsh coalfield being on stop since yesterday, business has come to a standstill. Hopes are entertained that better counsels will prevail, and that the meeting today between the Government and the representatives of both sides will be the means of arranging matters so that work can be resumed at once. Quotations are nominal.

Freights—Chartering is, if course, also at a standstill, but some little business is being done in anticipation of an early settlement of the dispute. Rates are approximately as follows:

Gibraltar	$3.84	Naples	$5.37	St. Vincent	$4.80
Marseilles	4.64	Alexandria	6.00	Rio de Janeiro	6.72
Algiers	4.27	Port Said	5.88	Monte Video	6.00
Genoa	5.28	Las Palmas	4.56	River Plate	6.24

Financial Department

Lehigh Coal & Navigation Co.

President S. D. Warriner reports for the year 1914 as follows:

As a result of the inauguration of operations at the new power plant of the Lehigh Navigation Electric Co., the Lansford power house of your company has been closed and power is now being purchased from the Lehigh Navigation Electric Co. The increased amount of current available has permitted a more complete electrification of the plants of your company at points where economies may be realized. An electric hoist has been installed at No. 5 Shaft and is now in successful operation. The new shaft at Rahn Colliery has been equipped with two sets of electric hoisting apparatus, and electric pumps and air compressors are being installed. On the completion of this installation, the boiler plant at this colliery will be abandoned. The increased use of electric fans has allowed the abandonment of long steam lines, thereby securing material economy.

RESULTS FOR CALENDAR YEARS.

	1914—Gross	—1913	1914—Net	—1913

x Includes stocks in treasury, $29,700 yearly, and bonds in treasury, $1,816,000 in 1914 against $393,813. y After adding sundry accounts adjusted, $146,763.

The sales of coal during 1914 amounted to 3,572,641 tons, an increase of 43,547 tons compared with the year 1913. Market conditions in 1914 were not satisfactory, owing in part to the mild weather during the early months of the year, and, while mining was continued during the summer with a fair degree of steadiness, in the latter months an overproduction in the market caused more or less suspension of mining operations. The slight increase in the sales of coal for the year, in the face of the unfavorable market conditions, was due to the energetic development of additional markets for your company's coal.

The net revenue derived from coal during the year was $761,373, an increase of $296,627 as compared with 1913. This increase was due to the economies realized in the more efficient operation of your company's mines as well as to the higher average rate of production per breaker hour operated.

The production of coal in 1914 from the lands of the Alliance Coal Mining Co., in which your company owns a substantial interest, was limited entirely to the operations of the tenants of that company under lease, the operation of the Alliance Colliery having been suspended throughout the year.

The total tonnage carried on canals during the season of 1914 was 349,586 gross tons, of which 242,587 gross tons were anthracite coal. There were 14,321 gross tons more of anthracite coal transported in 1914 than in 1913, and 17,976 gross tons more of miscellaneous tonnage, the latter increase being due to increased shipments of coal recovered from pools in the Lehigh River. The net loss resulting from canal operations for the year was $35,160, as compared with a net loss of $57,645 for the year 1913. The amount charged to operation on account of depreciation of plant and property was $18,992, as compared with $18,000 in 1913.

As mentioned in the last annual report, the Panther Creek R.R., formerly operated by your company in the Panther Creek and Nesquehoning Valleys, was sold to the Panther Creek R.R. Co., which was subsequently merged and consolidated with the Lehigh & New England R.R. Co. Your company is, therefore, no longer engaged, directly or indirectly, in the railroad transportation business.

During the year, your company increased its holdings of Lehigh & New England R.R. Co. stock by the purchase of 27,100 shares, and now owns 119,950 shares of the par value of $5,997,500. Dividends on this stock aggregating $425,600 were received during the year; this amount, together with the rentals paid by the Central R.R. Co. of New Jersey, and other dividends and interest received upon railroad stocks and bonds owned by your company are included in miscellaneous revenues.

The construction of the Lehigh Navigation Electric Co.'s power plant at Hauto, Penn., and its sub-station at Siegfried, Penn., together with the main transmission and distribution lines, was completed and placed in full operation on May 1, 1914. The plant is being operated steadily at about half its capacity, producing an average of over 200,000 kw.-hr. per day, which is sold to consumers with which connections have been made during the year. The amount of power sold is gradually increasing, and negotiations are under way which it is hoped will soon provide a market for the entire capacity of the present installation.

Note—For previous annual report of this company see Vol. 5, p. 754.

⁂

The Consolidation Coal Co. in 1914

Retiring directors of the Consolidation Coal Co. were reëlected at the annual meeting of the stockholders. Under the company's charter the stockholders also vote directly for officers, who were reëlected as follows: President, J. H. Wheelwright; vice presidents, F. S. Landstreet and G. T. Watson, and chairman, C. W. Watson. There was no other business transacted. No reference was made to Rockefeller interests.

The annual report for the year ended Dec. 31, 1914, showed the income account as follows:

	1914	1913	1912
Total income	$14,828,980	$15,443,246	$14,520,416
Net	3,392,645	3,826,703	3,746,890
Interest and sinking fund	1,382,913	1,366,974	1,243,531
Balance	*2,009,732	2,459,729	2,503,357
Dividends	1,500,000	1,500,000	1,358,865
Surplus	509,732	959,729	1,144,492
Previous surplus	8,774,252	7,814,523	7,014,023
Less adjustments	70,656	....	....
Total surplus	9,213,328	8,774,252	8,159,415

*Equal to 8.03% earned on $25,000,000 capital stock outstanding, compared with 9.8% earned in 1913.

The balance sheet of Dec. 31, 1914, shows total assets $74,782,841, of which coal lands, mining and railroad equipment owned is valued at $53,915,030. Stock and supplies on hand amount to $1,607,862, bills and accounts receivable $5,955,452 and cash on hand $1,555,227. In its liabilities the company includes $25,000,000 outstanding capital stock and $6,190,500 stock authorized but not issued, and bonded indebtedness is $29,916,000. Bills payable amount to $2,782,633.

In 1914 the total tonnage of bituminous coal mined by the company and its subsidiaries was 9,562,515 gross tons, a decrease of 397,296 from 1913. Coke manufactured last year amounted to 58,202 tons, a decrease of 17,848 from 1913. Coal mined by lessees in 1914 totaled 479,971 gross tons, 271 less than in the previous year.—"Philadelphia News Bureau."

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

✚Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared.

No.	Purchaser	City	State	Tonnage	Page
944	Brighton Foundry Co.	Chicago	Ill.		40

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

✚**No. 801—Henderson, Ky.**—Two bids have been received on this contract (Vol. 7, pp. 1005, 1126), which provides for furnishing the Municipal Electric Light Plant with about 9000 tons of coal. The Peoples Coal Co., which operates in this immediate vicinity, has bid $1 per ton, and the St. Bernard Mining Co. 85c. A severe fight is being made to award the business to the Peoples company because of the fact that a great many of the miners working for that concern are residents of Henderson. The question is now in the hands of a committee which will probably act on it shortly. Address Supt. L. P. Hite, Municipal Light Station, Henderson, Ky.

✚**No. 848—Chicago, Ill.**—While it was expected that awards on this contract (Vol. 7, p. 1049), which provides for furnishing the local Board of Education with its fuel requirements during the ensuing year, would be made on July 2, the matter was deferred until July 7, and on that date was again deferred for an additional two weeks. No information can be obtained as to when the contract will finally be placed. Address Secy. L. E. Larson, Bd. of Edu., Tribune Bldg., Chicago, Ill.

No. 894—Richmond, Ind.—All the bids submitted on this contract (Vol. 7, p. 1086), which provides for furnishing the Board of Public Works with approximately 10,000 tons of nut and slack coal, have been rejected. Requests for new bids will be readvertised. Address Pres. Alfred Davis, Bd. of Pub. Safety, Richmond, Ind.

✚**No. 905—Logan, Ohio**—Bids have been received on this contract (Vol. 7, p. 1126), which provides for furnishing the local Board of Education with approximately 400 tons of coal, as follows: Charles Vories, 1¼-in., screened, $2; Hocking Valley Brick Co., 2-in., screened, $2.15; Barthelson & Son, 1¼-in., screened, $2.10; Richard Barthelson, 1¼-in., screened, $2.12½; Helm Clay Products Co., 1¼-in., screened, $2.05. Address Clk. Herbert R. Harrington, Logan School Dist., Logan, Ohio.

1010—Kansas City, Mo.—This contract (p. 77), which provides for furnishing the fuel requirements of the Kansas City Soap Co., will be let about Aug. 15 if satisfactory propositions are received, and otherwise the company will continue to buy in the open market. Address H. L. Fetters, Kansas City Soap Co., Shawnee and Railroad St., Kansas City, Kan.

1066—Pella, Iowa—Bids on this contract will be received until 6 p.m., Aug. 3, instead of July 20, as previously announced (p. 116). Lump, mine-run and steam coal are required and quotations should include cost of delivery in the bin at the light plant. Address City Clk. A. C. Kuyper, Pella, Iowa.

1088—New York, N. Y.—Bids have been received on this contract (p. 117), which provides for furnishing the Department of Bridges with about 250 tons of both No. 1 buckwheat and mine-run coal as follows:

	Buckwheat No. 1	Mine-Run
Burns Bros.	$3.25	$3.30
Gavin Rowe	3.48	3.48
John F. Schmadeke, Inc.	3.51	3.61

Address Bridge Comr. F. J. H. Kracke, Municipal Bldg., New York City.

New Business

✚**1131—Wellington, Ohio**—The Municipal Electric Light Plant at this place usually contracts some time in the fall for their annual requirements of coal aggregating approximately 900 tons of three-quarter lump. The customary price is about $2.35 per ton, and the business is done on a competitive basis. Address Supt. C. E. Gadfield, Municipal Elec. Lt. Plant, Wellington, Ohio.

✚**1132—Bloomington, Ill.**—The Board of Education at this place received sealed bids until 4 p.m., July 26, for furnishing approximately 1000 tons of bituminous lump coal. The storage capacity of the school buildings is to be filled prior to Sept. 1, and payments will be made Jan. 1 and July 1. The successful bidder will be required to furnish a satisfactory bond for $6000. Address Chn. R. E. Williams, Bd. of Edu., 602 Peoples Bank Bldg., Bloomington, Ill.

✚**1133—Springdale, Penn.**—The Board of Education will receive bids until 6 p.m., Aug. 3, for furnishing approximately 4000 bu. of mine-run coal to be delivered in the basement of the school buildings. Address W. A. Clowes, Jr., Boro. of School Bd., Springdale, Penn.

✚**1134—Butte, Mont.**—The Board of Education at this place usually receives bids about Sept. 1 for furnishing the coal supply amounting to approximately 3000 tons per year. Lignite coal is used principally and the usual price is about $4.50 per ton. Address District Clerk, Box 1413, Butte, Mont.

1135—Louisville, Ky.—The annual contract of the Louisville Provision Co. for their coal supply involving about 2400 tons of nut and slack coal expires on Sept. 1. The company requires delivery by wagon. Address J. M. Emmart, Louisville Provision Co., 916 East Market St., Louisville, Ky.

1136—Bloomington, Ind.—The trustees of Indiana University are requesting bids for furnishing the School of Medicine and the Robert W. Long Hospital with coal during the ensuing year. Specifications are on file at both the medical school and the University. Address John W. Cravens, Bd of Trustees, Bloomington, Ind.

✚**1137—Jefferson City, Mo.**—Sealed proposals will be received until Aug. 2 for furnishing the Missouri State Penitentiary with about 25,000 tons of coal during the year beginning Nov. 1. No. 1 Illinois washed egg coal and 6-in. Missouri and Illinois lump are required. Bids should be made f.o.b. Penitentiary switch. A bond for $10,000 will be required for the faithful performance of the contract, and all bids must be accompanied by a certified check for $1000. Address Warden D. C. McClung, Missouri State Penitentiary, Jefferson City, Mo.

+1138—Cuyahoga Falls, Ohio—Sealed proposals will be received until Aug. 5 for furnishing the local schools with either Pittsburgh, Youghiogheny, or Bergholtz three-quarter lump coal. Bids may be submitted on either one or all three of the buildings involved. Address Secy. H. N. Rook, Cuyahoga Falls School Bd., Cuyahoga Falls, Ohio.

+1139—Marion, Ohio—The Board of Education received sealed bids until noon, July 26, for furnishing about 480 tons of coal required at the different school buildings during the ensuing year. Bids were requested on Hocking, Sunday Creek or Pomeroy domestic lump, or coal of equal quality. Address Clk. Jeanette L. Hutchinson, Bd. of Edu., Marion, Ohio.

+1140—Beaver Falls, Penn.—The School Board at this place will receive bids until 5 p.m., Aug. 1, for furnishing and delivering 1600 bu. of three-quarter inch Pittsburgh forked coal to be rescreened at the car. Address Secy. H. J. Shaefer, Beaver Falls Bd. of School Dir., Beaver Falls, Penn.

1141—Princeton, Ill.—Bids will be received until Aug. 2 for supplying the Court House and Jail with coal during the ensuing year. Address County Clk. James Fletcher, Bd. of Supervisors, Princeton, Ill.

+1142—Sprague, Wash.—The Board of Education will receive bids until Aug. 20 for furnishing 75 tons of washed steam coal and 16 tons of lump coal. Address Clk. J. F. Hall, School Dist. No. 6, Sprague, Wash.

+1143—Spokane, Wash.—The Board of Education at this place usually contracts for their annual fuel requirements some time in August. The call for bids is advertised, and the customary price is about $5 per ton. British Columbia mine-run coal is used and about 1500 tons is required. Address Board of Directors, School Board, Spokane, Wash.

+1144—Nelsonville, Ohio—The Board of Education at this place will receive bids until noon, Aug. 26, for furnishing the mine-run coal required at the several school buildings during the ensuing year. Address Clk. E. B. Beard, City Bd. of Edu., Nelsonville, Ohio.

+1145—Galesburg, Ill.—The City Government will receive sealed bids until 4 p.m. for furnishing its fuel requirements during the period ending Apr. 30, 1916. Bids for the Poor Departments and other city buildings, excepting the Water and Electric Light Plant, are to include cost of delivery, and bids for the Water and Electric Light Plant are to include delivery to the shed at the water-works. All bidders must furnish a sample lot of the coal they propose supplying sufficient to run the plant 24 hr. A certified check for $100 must accompanying each bid, and the successful bidder will be required to furnish a bond for $2500. Address City Clk. William L. Boutelle, Galesburg, Ill.

+1146—Wichita, Kan.—The Board of Education at this lace usually contracts for their annual fuel requirements some time in August. About 2500 tons of bituminous and semi-bituminous coal is required. Bids on the current contract were as follows, Weir City Coal being bid on exclusively: Mill, $3; lump, $4.40; nut, $3.60; slack, $2.75 to $3. Address Board of Education, City Hall, Wichita, Kan.

1147—Philadelphia, Penn.—The Martin & W. H. Nixon Paper Co. at this place usually contract for its annual fuel requirements, involving about 1500 tons of mine-run bituminous, on Aug. 1. The company has a storage capacity for 1000 tons, and deliveries are by rail at the rate of approximately 50 tons per day. Address Pur. Agt. J. O. Hayes, Martin & W. H. Nixon Paper Co., Manayunk, Philadelphia, Penn.

+1148—Tingley, Iowa—The school board at this place received bids until July 23 for furnishing 1000 bu. of Illinois and Centerville coal to be delivered in the bins. Address Secy. H. W. Edwards, Tingley, Iowa.

+1149—Broken Bow, Neb.—Bids will be received until noon, Aug. 10, for furnishing Custer County with its coal requirements during the ensuing year. All bids must be accompanied by a certified check for $25 and quotations are required on nut coal, f.o.b. sidetrack at Broken Bow. Address County Clk. R. E. Waters, Broken Bow, Neb.

+1150—Muscatine, Iowa—Sealed bids will be received until 1:30 p.m., Aug. 2, for furnishing approximately 400 tons of bituminous coal for use in the County Institutions. Bids should be on four- and six-inch lump coal, f.o.b. cars at Muscatine. About 200 tons must be delivered during August. Address County Audr. H. C. Shoemaker, Muscatine, Iowa.

+1151—New York, N. Y.—Bids will be received until 11 a.m., Monday, Aug. 2, for furnishing and delivering 23,700 gross tons of anthracite and semi-bituminous coal for the Board of Education. Blank forms and further information may be obtained on application. Address Supt. of School Supplies Patrick Jones, Bd. of Edu., 59th St. and Park Ave., New York, N. Y.

+1152—Minot, N. D.—The School Board of Harmony School District, No. 151, will receive sealed bids till 2 p.m., Aug. 14, for furnishing the coal requirements at School No. 2 of that district during the ensuing year. Address Clk. Cole Larson, School Bd. Harmony School District, Minot, S. D.

+1153—New Philadelphia, Ohio—The Board of Education will receive sealed bids until noon, Aug. 5, for furnishing the coal required at the several school buildings during the ensuing school year. Bids are requested on screened forked coal. Address Clk. A. A. Stermer, Bd. of Edu., New Philadelphia, Ohio.

+1154—Kingman, Kan.—The Board of Education will receive sealed bids until Aug. 2 for furnishing 200 tons of Cherokee nut, one-half the deliveries to be made during August, and the balance during the Christmas vacation. Address Clk. Beulah Russell, Bd. of Edu., Kingman, Kan.

+1155—Harvey, N. D.—The Board of Education will receive sealed bids until 8 p.m., Aug. 2, for furnishing 100 tons of the best grade Hocking Valley coal. Bids are to include cost of delivery in the boiler room at the High School. Address Clk. P. J. Reimer, Bd. of Edu., Harvey, N. D.

1156—Marcus Hook, Penn.—The Pure Oil Co. at this place will receive bids until Aug. 1, for furnishing from 7500 to 10,000 tons of bituminous coal. Address Purchasing Agent, Pure Oil Co., Lafayette Bldg., Philadelphia, Penn.

+1157—Brookings, S. D.—The City Government will receive sealed bids until 8 p.m., Aug. 2, for furnishing the annual coal supply during the ensuing year. Quotations should be made f.o.b. cars at Brookings and deliveries are to be made in box cars. Bids are also requested for hauling the coal. Address County Audr. G. H. Stoddard, Brookings, S. D.

+1158—St. Clairsville, Ohio—Sealed proposals will be received until 1 p.m., Aug. 16, for furnishing the coal requirements of Belmont County Court House and Jail during the ensuing year. A satisfactory bond or certified check for 25% of the amount bid must accompany all proposals. Address County Audr., Emerson Campbell, St. Clairsville, Ohio.

+1159—Plains, Penn.—Sealed proposals will be received by the Board of Education until 7 p.m., Aug. 9, for furnishing the coal required at the local school buildings during the ensuing year. Address Secy., James J. Judge, Bd. of Edu., 5 S. Main St., Plains, Penn.

1160—Kansas City, Mo.—The Park View Hotel at this place will be in the market about Sept. 1 for approximately 200 tons of semianthracite, nut and slack coal. Address Manager, Park View Hotel, 10th and Paseo St., Kansas City, Mo.

+1161—Colorado Springs, Colo.—The Board of Education of this place will contract about Sept. 1 for its annual requirements of coal, amounting to approximately 3000 tons of mine-run lignite. The current contract is being filled at about $2.50 per ton. The call for bids is advertised and deliveries are to be made as required. Address Board of Education, D. E. Graff Bldg., Colorado Springs, Colo.

1162—Delphi, Ind. — Sealed proposals will be received until Aug. 3, for furnishing the County Poor Asylum, Jail and Court House with approximately 250 tons of anthracite and Hocking Valley or some other grade of soft coal. The coal is to be delivered as required. Address Aud. M. G. Huan, Carroll County, Delphi, Ind.

1163—Carthage, Mo.—The Board of Education will receive bids until Aug. 3, for furnishing 250 tons of Nevius coal to be delivered in the bins of the various buildings. Address Chn. W. F. Maring, Supply Com. Bd. of Edu. Carthage, Mo.

1164—Fargo, N. D.—The Board of Education will receive bids until 8 p.m., Aug. 4, for furnishing 2000 tons of screened lignite coal to be delivered at the different school buildings as required, during the period ending June 1, 1916. Bids are also requested on 200 tons of Pocahontas mine-run. All bids must be accompanied by a certified check for $100. Address Secy. E. G. Guthrie, Bd. of Edu. High School Bldg., Fargo, N. D.

1165—Greensburg, Penn. — The Board of Education of Greensburg will receive bids until Aug. 4, for furnishing and delivering No. 1 screened coal and good stock coke, to the different buildings as required. Address Secy. Harry E. Blank, Bd. of Edu., Greensburg, Penn.

1166—Emporia, Kan.—The Board of Education will receive bids until Aug. 2, for furnishing its coal requirements during the ensuing year. Address Clk. M. N. Champe, Bd. of Edu., Emporia, Kan.

1167—Guthrie Center, Iowa—Bids will be received until noon, Aug. 3, for furnishing the Guthrie County Court House with coal during the ensuing year. Address Chn. W. H. Neal, Bd. of Supervisors, Guthrie County, Guthrie Center, Iowa.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

No. 363—Toledo, Ohio—This contract (Vol. 7 pp. 566, 955), which provides for furnishing the local Water Works with approximately 6000 tons of coal for use at the Broadway Pumping Station, has been awarded to the **M. A. Hanna Co.** at $1.90 per ton. Address Supt. P. R. Cook, Water Works Dept. Toledo, Ohio.

+No. 726—New York, N. Y.—This contract (pp. 76, 157) has been awarded as follows: **William Farrell & Son,** Item No. 1, $6819.50; **Bacon Coal Co.,** Item No. 2, $3510; **Commercial Coal Co.,** Item No. 3, $3708. These were the lowest bids on this business. Address Fire Comr. Robert Adamson, Municipal Bldg., New York City.

+No. 810—Oelwein, Iowa—This contract (Vol. 7, p. 1006), which provides for furnishing the City Government with approximately 900 tons of coal, has been awarded to the **Norwood White Coal Co.** on steam coal at $2.03 per ton. Address City Clk. E. H. Burlingham, Oelwein, Iowa.

+No. 824—Detroit, Mich.—This contract (Vol. 7, p. 1049), which provides for furnishing the local Board of Health with coal, has been awarded to the **United Fuel & Supply Co., William E. Besancon** and **Daniel Sullivan.** About 2000 tons of bituminous mine-run and 500 tons of anthracite will be required. Address Secy. John F. McKinley, Bd. of Health, 223 St. Antoine St., Detroit, Mich.

No. 929—New Orleans, La.—The price at which this contract was awarded (Vol. 7, p. 1127, Vol. 8, p. 42) was $2.65 per short ton. The contract calls for Pratt washed nut and slack coal, with a guarantee of 14,500 B.t.u., not to exceed 6% ash or 3% moisture. The contract covers the year from July 1. It was awarded to the **Tennessee Coal, Iron & Land Co.** through its agent, Frank S. Walsh, of New Orleans. Address Fred W. Matthews, Charity Hospital, New Orleans.

Contract Notes

St. Louis—Bids for supplying coal to the City of St. Louis for all city institutions, departments and offices except the waterworks for the twelve months ending July 31, 1916, were opened July 9, at noon. The bids were as follows, the probable successful bid being noted in **full face** type:

	Lump Coal											Nut		Washed						Coke	
	Four Courts and Courthouse	Industrial School	Engine Houses	Parks	Infirmary	All other City offices	Workhouse (car)	Asphalt Plant (car)	Harbor Boat	Harbor Boat (wagon)	Robert Koch Hospital (car.) [1] Carterville egg. [2] Smokeless. [3] Youghiougheny. [4] Anthracite.

Because the bids for delivering lump coal to the harbor boat by wagon were higher than that of the Boehmer Coal Co. for delivering lump to all other city offices, the contract under the harbor boat classification was awarded to the Boehmer Co. under the other classification. The Stephan Coal Co. bid $5 on Pennsylvania smokeless but as the specifications called for West Virginia smokeless the contract will go to the Polar Wave Co. on its bid of $5. Comparison with last year's figures shows that the prices are, on the whole, a little lower. The quantities estimated to be required during the year are as follows: Sanitarium Pumping Station, 20,000 tons nut; City Hospital, 12,000 tons washed; City Hall, 10,000 tons washed; Robert Koch Hospital, 3000 tons lump; Work House, 3400 tons lump; Industrial School, 2600 tons lump; Infirmary, 1500 tons lump; Harbor Boat and other offices, 2500 tons lump; coke, 3500 tons; anthracite coal, 250 tons; Youghiogheny coal, 250 tons; Carterville egg, 600 tons; smokeless coal, 600 tons. Address Supply Comr. J. B. Thomas, City Hall, St. Louis, Mo.

+Louisville, Ky.—Contract of the American Creosoting Co. for 3000 tons of screenings per annum has been let to the **Consolidated Indiana Coal Co.** until Apr. 1, 1916.

Corinna, Me.—Burrill & Clark at this place purchase about 600 tons of steam coal per annum as required. They have a storage capacity of 200 tons and deliveries are made by water and rail. Address E. R. Clark, Corinna, Me.

+LeSueur, Minn.—The city contract at this place has been awarded to the **St. John Grain Co.,** on "Orient" egg coal to be shipped from Franklin County, Ill. The price was $1.35 per ton f.o.b. cars at mines.

Fairview, Okla.—The Local Electric Light Dept., consumes approximately 1680 tons of mine-run coal per annum which usually costs about $3.68 per ton. The business is let on competitive bids. Address Supt. P. H. Wimpey, Fairview, Okla.

Putnam, Conn.—The Putnam Light & Power Co., at this place buys its coal under a 100,000-ton contract made by the Saylesville Bleacheries, at Saylesville, R. I. The business is let on competitive bids, and New River coal is used. Address Gen. Mgr. R. Y. Thurston, Putnam Light & Power Co., Putnam, Conn.

Rock Rapids, Iowa—The Municipal Electric Light Plant at this place consumes about 1400 tons of coal per annum which is bought entirely in the open market. Iowa steam coal is used principally, and the cost is about $3.25 per ton. Address Supt. W. F. Gingrich, Municipal Electric Light Plant, Rock Rapids, Iowa.

Carrollton, Ky.—The Light Department at this place consumes about 2200 tons of bituminous nut coal which usually costs about $2.75 per ton. The business is not done on competitive bids. Address R. L. Bartlett, Carrollton, Ky.

Bayfield, Wis.—The Bayfield Light, Power & Water Plant, at this place consumes about 400 tons of Pittsburgh screenings per annum, the coal being required only during three months. The business is not done on a competitive basis and the approximate cost is $2.30 per ton. Address Supt. F. M. Herrick, Bayfield Light, Power & Water Plant, Bayfield, Wis.

Watkins, N. Y.—The Watkins Municipal Light & Water Plant, consumes about 1200 tons of bituminous coal per annum which is bought at approximately $2.30 per ton. No contracts are made and the business is done on a competitive basis. Address Supt. Charles E. Dennis, Watkins Municipal Light & Water Plant, Watkins, N. Y.

Waukon, Iowa—The Interstate Power Co. at this place consumes about 700 tons of washed screenings per annum, which is usually bought at approximately $3.40 per ton. The coal is not bought on competitive bids. Address E. B. Gibbs, Interstate Power Co., Waukon, Iowa.

Erie, Penn.—Bids for furnishing the local Fire Department with coal during the ensuing year were opened on July 1, as follows: Burnwell Coal Co., $5.15, anthracite f.o.b., and $5.90 in bin; G. B. Gebhardt, $5.77½ for anthracite f.o.b. and $2.75 for Pittsburgh coal; Erie Coal Co., $5.15, anthracite f.o.b., and $5.65 in bin; Wittman-Pfeffer Co., $5.15, anthracite f.o.b., $5:65 in bin, and $3.75 for Pittsburgh coal; Momeyer Coal Co., $5.15, anthracite f.o.b., and $5.65 in bin; Guelcher Bros., $5.15, anthracite f.o.b., and $5.90 in bin; Mutual Coal Co., $5.25, anthracite f.o.b., and $5.70 in bin; W. L. Scott Coal Co., $6, anthracite f.o.b., and $6.35 in bin; Saltsman Coal & Supply Co. and the J. F. Siegel Coal Co. each bid $5.15 per ton, anthracite f.o.b.

+Portland, Ind.—The contract for the coal needed to operate the city light and power plant for the coming year will be let to the **Southern Coal & Coke Co.,** of Knoxville, Tenn. The coal will be purchased at 90c. per ton the freight rate being $1.55, making the total cost of $2.45.

COAL AGE

Vol. 8 NEW YORK, AUGUST 7, 1915 No. 6.

What is a Mining Engineer?

A MINING ENGINEER *is an individual who cherishes hopes that some day—the day when he will be able to call himself a superintendent or consulting engineer—he may be able to earn as much money per month as does the average coal digger or other indispensable personages connected with the mining industry.*

OCCASIONALLY a mining engineer manages to get control of a modest bank account by capitalizing some of the information he has gathered from various sources at various times as to values of undeveloped mineral tracts. On such occasions, however, some employer or past employer is certain to come forward to insist that the engineer betrayed a trust in using information that he was supposed to acquire for the benefit of anyone who might wish to use it except himself.

If an executive officer absorbs general information given to him by his engineer and then passes it on to a son or other relative having no connection with the company and allows him to make the most of it, his directors may censure him on the ground that he is giving too much attention to outside business, but the director hasn't yet been born who would class such procedure as a betrayal of trust.

And the reason is not far to seek—directors do not expect employees to mortgage themselves body and soul when they seek employment. Truth is, directors are not fond of defining too closely the rights of individuals in the employ of others, because directors realize that they, too, are only individuals in the eyes of the law.

Mining engineers are considered the logical referees in all cases where disputes arise between land owners and leasing companies, and their decisions are seldom questioned even though one of the parties to the dispute is the employer of the engineer.

In times of labor troubles mining engineers are pressed into service as mine guards, and in slack times, when they begin to find enough idle time to brush up on the theory of their profession, they are permitted to assist the clerical forces—mining engineers are so good at figures, you see.

But in times of extreme prosperity, when dividends begin to pile up and stock values change daily, many coal companies conveniently forget that the mining engineer might be willing to share in the general improvement and do it as uncomplainingly as he shouldered the gun for guard duty.

Possibly he might be willing to use part of the easy money that came his way to prepare one of his sons to follow in his footsteps, even though up to the present writing a mining engineer, son of a mining engineer, is almost a curiosity.

Ideas and Suggestions

Day-Labor Cost of Operating Coal Mines

By George S. Brackett*

The price paid the miners and loaders for placing the coal on the mine car at the working face is the largest single item in the costs of operating bituminous coal mines. The next largest is the day-labor expense. The former is practically fixed for each region and does not vary. Every ton of coal produced costs just so much, and regardless of the management it remains the same. It is not subject to adjustment by the ability of the superintendent or foreman. It is entirely eliminated from any discussion as to methods of reducing the cost of production, being an item beyond the management's power to change. The royalty charges are also fixed and not amenable to adjustment. The supply account is much the same from month to month, as the necessary material must be purchased as needed. Extra expenditures for material may be postponed temporarily, but in the long run from year to year little change can be made in the supplies used at the mine.

The superintendent's ability to handle and operate a mine successfully hinges principally on the one item—the day-labor cost of operation. This he can reduce or raise at will within certain limits. He can improve the underground conditions while better market prices rule or reduce the amount of labor done during dull times. The success or failure of the mine depends largely on this labor cost. It is subject to more variation than any other cost item on account of its being dependent almost entirely upon the individual ability of the management, and this quality has as many variations as there are individuals.

The question of what this cost should be is much disputed, and many estimates are made based on any one or group of mines. Each superintendent knows what he is doing himself, but there is more or less reticence in exchanging figures with neighboring mines.

Establishing an Average

An average value for this cost of labor is important, and the impracticability of obtaining average figures over large sections for periods of considerable time has led to much misunderstanding and criticism of the local management. The average cost is not what, in the opinion of a few men, the work should be done for, nor is it a few months' test run. It is a figure covering a long period of time, allowing for considerable mining difficulties and embodying some allowance for the labor necessary to the general maintenance and repairs of the mine and plant. It should include a wide variety of conditions, both favorable and adverse. Granting that this average can be established, the benefit to the operators is evident.

The accompanying diagram is compiled from published figures of 454 mines in Pennsylvania and West Virginia. The number of mines entering into the average is so great that any inaccuracy that may occur in the report from any one mine would be inappreciable in the result. Any temporary conditions such as an unusually high or low cost simply influence the result in making the figures represent average conditions through long-time operation. Also mines were selected which worked over 230 days in the year, so that the estimate may be taken as of mines producing their capacity and maintaining their equipment and mine conditions.

The foundation of the diagram is the mean force of day employees requisite at the mine for a period of one year; and the average daily shipments are based on the annual production. Some mines included in the average may be going through that period of reconstruction and betterment that is advisable periodically. Others may be using every means of economy. In fact, the figures may be taken as being very fair operating expenses covering a considerable period of time and variable conditions. They do not represent the cheapest mine nor the most expensive. Certain mines must necessarily call for higher labor costs than others, but these conditions are known, and any such allowance made to fit the individual case. Although the figures include an average amount of rock work they do not represent exceptions; and they represent the average haul over the large number of mines.

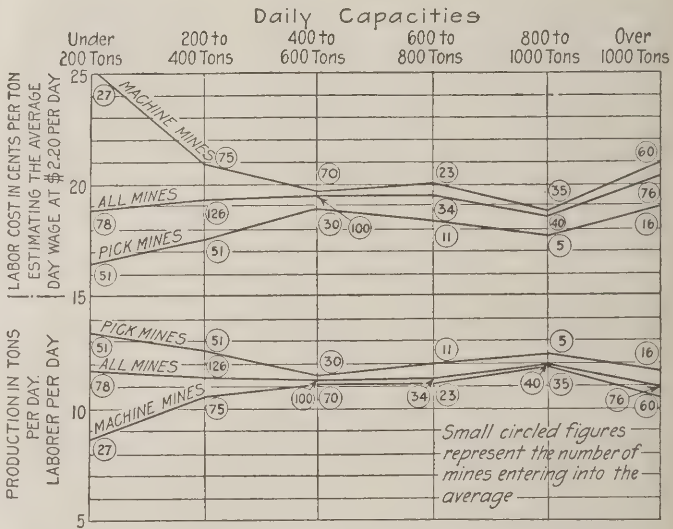

DIAGRAM SHOWING LABOR COST OF PENNSYLVANIA AND WEST VIRGINIA COAL MINES

Basis of the Calculation

The basis of the diagram is the number of tons output per day-employee or day-laborer per working day. It does not take into consideration any extra-time track men, drivers and others who may be working while the mine is idle. It is customary for some day-men to work in idle time on something that may be then more easily done. Although this is a small percentage of the regular day-labor expenses it is something, and it would accordingly increase the cost given in the diagram. In explanation of the chart, it may be added that the force of miners or loaders necessary to produce the tonnage is not figured in the day-labor cost, the coal being loaded on the mine car at the working face by the requisite number of miners. The coal is hauled by drivers, track laid and repaired by trackmen, doors opened by trappers; these, with the motormen, brakemen, dumpers, trimmers, car shifters and all other day-labor necessary to move this tonnage from the working face to the loaded railroad car, are represented on the diagram in the "Production in Tons per Day-Laborer per Day" and "Labor Cost in Cents per Ton, Estimating the Average Day Wage at $2.20 per Day."

---

*Flemington, W. Va.

Calculating an Average Cost per Ton

Firebosses are included when employed, also shopmen and carpenters; but not the superintendent or mine foreman or the mine-office force. It is simply the bare day-labor cost. The cost per ton is derived from the tons per day-man per day. The greater the tonnage the less the cost. The averages given in the lower half of the diagram show that the production per day-man runs from 8.7 tons for the low-capacity machine mines up to 13.4 tons for the low-capacity pick mines. These are the extremes in the averages.

To reduce these figures to cents per ton, an average day wage throughout the industry must be assumed. This average varies in different regions, and the upper half of the diagram may have to be readjusted to a small extent to fit the prevailing wage scale. Curiously the average production per day-man per day remains practically unchanged throughout many thicknesses and characters of coal—for the central Pennsylvania thin steam coals, western Pennsylvania thick gas and coking coals, thick steam coals of southern West Virginia and the thick and thin gas coals of central and northern West Virginia.

If any variation from this is to be noted it is in a little greater efficiency in the regions where the higher wage rates are in effect. For this reason a moderate average day rate was established; namely, $2.20 per day—little higher than the existing average in the low-rate regions and lower than those existing in western Pennsylvania. Considering this, I doubt very much if the costs per ton shown on the diagram can be changed materially for a wide range of mining conditions and wage rates throughout the bituminous coal regions.

Great Variation in Production

There is an almost inexplicable variation in the production per day-laborer per day when individual mines are considered, extreme cases running from 20 tons down to 5 tons. This indicates some confusion in this mine-labor item and the lack of any well-founded base for what this cost really should be.

It will be noticed that 51 pick mines with a capacity of less than 200 tons daily were operated with a labor cost of 16.6c. per ton—the cheapest group of mines. The interpretation is that these mines are so small and simple in their organization and so few men are employed that it is almost impossible to blunder in their operation. The only explanation advanced as to the rise in costs in pick mines up to 400 or 600 tons capacity is that these mines outgrow the crude management of the smaller mines up to that point; and from there up to the 1000-ton mark the more experienced management is in evidence.

Small capacity machine mines are a failure, as the cost of the power house and appliances are prohibitive for such small tonnages, and the operating costs of these mines decline generally up to 1000-ton capacity. There is little variation in this decline, as their equipment calls for experienced men in the start.

The reason for the increase in cost of all mines over 1000-ton capacity can only be speculation, but the evidence points to their being too large for almost any human being to exercise the proper supervision. Large mines are almost always equipped with the most modern labor-saving appliances, and their labor costs should be correspondingly less.

⁂

Temporary Center Post

The majority of accidents in the bituminous mines of Pennsylvania occur from falls of roof at the working faces. This fact has led to devising means whereby the danger at these places might be reduced. About a year ago the state inspectors having charge of the mines in the coke region decided after much investigation, to enforce the placing of a temporary center post at the working face of all places, regardless of whether the apparent condition of the sustaining roof appeared to require it or not.

Instructions to this effect were sent to all the operators and met with but little opposition. The inspectors did not claim that the center post was necessary at every face and admitted that in many places it appeared ridiculous to require it; but they did maintain, and rightly, that there should be no exception. It is well known that where the roof is naturally bad it is impossible always to judge just how safe the roof really is. Places that appear almost absolutely safe are sometimes the most dangerous.

It was to guard against these unseen as well as the known dangers that made the placing of the center post imperative in *all* places, in the judgment of these inspectors.

By this method a post is set in the center of the place within a foot or two of the face, by the miner before he begins to dig or load coal. As he advances in his work during the day, he will set another post if the face advances more than 3 ft. from the first post. In this manner the workman is always protected from falls of roof. The cost is small, as the post, being only temporary, can be set in a few minutes by the miner, and may be used time after time.

At one group of mines where the roof is very treacherous it is known that several accidents have been prevented in the last year through this precaution, and there were probably many more of which we do not know.

One of the inspectors is authority for the statement that the setting of a center post has reduced his accidents fully 40 per cent. All of the operators agree that this is one of the best orders put in force in late years, and this region will show a decrease in fatalities at the working faces in the next report.

Mining With a Conveyor System

By J. F. K. Brown*

SYNOPSIS—By installing 300-ft. conveyors and changing the general plan of operation of the mine, not only was mining rendered more safe, but the output was increased and the costs lowered.

The method of operation by conveyor herein described has been in use in a number of collieries belonging to a company working some comparatively thin measures in one of the coal fields in Scotland, and has proved its success and applicability through a period of at least 10 years. In some respects the method adopted was unusual in that while conveyors are in operation by themselves no coal-cutters are employed, undercutting being done by hand. Present-day practice always considers conveyor work an adjunct to machine mining; but here is a case of conveyor practice by itself. Another distinctive feature is that the opening and development of the mine for additional faces, as well as running the usual long-wall faces with the conveyor, are being done with a conveyor wall.

The coal seam on the average is 3 ft. 9 in. thick, but owing to the presence of stone bands is rather broken up, a correct section being as shown in the accompanying drawing. This means that after removing 31 in. of coal there remains to be disposed of somewhere about 14 in. of stone. The thick stone parting near the bottom of the coal is a yellow-white sandstone that breaks in flat squares, eminently suited for building the road pillars in longwall working.

The roof, which is an important factor in any mine's success, and particularly so in this case, consists of 10 to 12 in. of a strong "bind" (shale), above which is at least 5 ft. of a "mealy" soft "bleas"—also a local term for a shale—which possesses no adhesive powers of its own, and invariably flows into the workings wherever the shale immediately below it gives way.

Above this "mealy" shale is a thick bed of a heavy blocky sandstone. This naturally exerts a considerable downward pressure through the fine shale and on the "bind," which forms the only stiff parting in the roof, unless the whole 5 ft. of the "bleas" was taken down up to the sandstone above. To do this made too high a working, and proved too costly to practice; consequently efforts were always made to keep the "bind" unbroken.

In working under the old system, "dooks," or "deeps," were driven direct to the dip, the inclination being 8 deg. These "dooks" were driven in the solid coal, with pillars turned off every 150 ft. on the dip and 60 ft. on the level course. Every 300 ft. levels were broken off right and left, and a longwall face commenced two pillar lengths from the center deep, in a fan-shaped fashion, which as it opened out gradually edged uphill until its upper corner worked along the waste of the level above, and the face stretched from one level to another.

In driving the "deeps" three roads were allowed—one for haulage and intake air current while the two on either side where needed for return air. In order to operate the longwall faces at low cost, slants were driven uphill from the lowest level, and from the slant levels parallels to the main bottom level turned into the coal face, these being a distance of 40 ft. apart.

Every 200 ft. along the bottom level a fresh slant would be commenced, the object being to cut off the continually lengthening tramming levels and so provide a shorter haul to the level below, whence horse haulage conveyed the coal to the "deep."

As the working was only 45 in. high, it was necessary in all cases to "brush" the roof every night on each face 4 or 5 ft., and sometimes back-brushing 70 or 80 ft. behind the face could not be avoided in the levels. In some cases also it was necessary to brush slants owing to the rapid sinking of sandstone rock after the "bind" was once broken. Naturally, this brushing had to be carried up to the sandstone above the coal, and as much of the material thus brought down was fine and "crumbly," it had to be hoisted to the surface and disposed of there, all of which spelled loss in capital letters.

The building of the needed pack walls was done with the "bind" from the road heads, the stone from the seam itself, and partly from the sandstone taken down in back brushing. It was found by practice that this way of setting out working in semicircular fashion amounted practically to an invitation to the roof to fall in heavily in the center, where the lines of pressure converged.

By This Method the Roadhead Was Unsafe

In this method of operating the seam the "bind" was fractured in the regular course of working, and in such a manner as to create a series of parallel breaks running sometimes across the strike of the coal bed, or at any angle thereto. These breaks had a tendency to extend in advance of the coal, rendering the roadhead, unless special precautions were taken, an unsafe working place in comparison with the rest of the face.

Possibly owing to the dip and the nature of the overhead strata, there was also noticed a decided "creep" of the roof downhill, and in the course of a few weeks the rise side of each of the levels would start to press out the "mealy" shale, necessitating constant cleaning of the road. This also created trouble due to large holes or caves being left, which had afterward to be supported with fresh packing or timber. In short, troubles from the roof were constantly recurring, resulting in excessive costs.

Under these circumstances the officers in charge decided to experiment in the introduction of conveyors. With these in operation they expected to be better able to control the roof, not through the actual installation of this or any other machine, but through the regularity of working imposed by the fresh conditions introduced by the conveyor's advent.

The coal was still cut by hand. The chief idea of the introduction of the conveyor was to secure a better, safer and more easily handled working section, which would improve the speed of extraction and reduce the cost, mainly through a considerable reduction in the number of dead-work men in each section.

---

*149 Park St., Sydney, N. S.

During the ordinary longwall methods of working the following men were employed in the section: Miners, 14; brushers, 7; trackmen, 2; timbermen, 3. The output was 45 tons.

The miners trammed their own coal to the main level. In the layout of the workings for the conveyor there was little actual difference in the direction of development. The faces still extended across the strike; but in place of the three parallel deeps a longwall face was laid out at an angle between the dip and strike, so that the left-hand end was the most advanced, which allowed the coal and water to gravitate to one point. The driving and formation of pillars were thus dispensed with, and the longwall system of extraction became a developing system as well.

Levels were laid out every 300 ft., and those lower down the deep, being started at a later date, were naturally behind the others, a distance that varied with the speed of travel in the advancing face.

Formerly seven or eight roads were used in the waste in each section after the coal had been extracted, but in the new system only two roads were so maintained—the main working haulage level and one other a distance of 40 to 45 ft. below it. To reach the latter, short angle deeps or slopes were driven at frequent intervals, each slope being superseded by a fresh one; but special care was taken to arrange that no part of this bottom road was cut off or abandoned unless the face from the level below was in advance of the portion thus cut off. Instead of building the walls on the down side of this level as a continuous wall, spaces were left every 10 ft. or thereabout, the length of the pack being taken along the face rather than along the road.

BOTTOM ROAD IS MADE A "SAFETY VALVE"

The object of driving this bottom road was solely for the purpose of obtaining a "safety valve" for roof pressure. As already stated, the roof had a decided tendency to creep downhill, and since with the conveyor working the roof "bind" was not broken at all, except by its own weight back in the waste, it was found that this movement downhill was, if anything, increased. In order therefore to provide some space into which the pressure of the roof could exert itself without causing damage to the main level, this second level was driven, and with well-built pack walls on the main level, the roof rode over it, to break in the level below.

It might naturally be inferred that the lowest level should have been the haulage road, since otherwise coal would have to be raised to the road above. In practice it was found that the cost of constantly repairing the roof and floor of the lower level when used as the haulage road was exceptionally heavy, and the idea was then adopted of moving the main road to a level higher up and allowing the roof pressure to exhaust itself into the old road. This arrangement worked satisfactorily. The extra cost of lifting the few tons of coal extracted from the face below to the level of the main road was more than compensated for by the lesser upkeep of the haulage road.

All timber, tools or other material needed for the men of the lower section is brought in by the main level of the section above, and through this lower level and the opening in the pack wall, is passed into the top of the conveyor, and hence down to the man or men requiring it. This saves considerable handling and hauling of material and supplies up a long conveyor face, and is an improvement over the old method of hauling timber to the face.

Each conveyor face is approximately 300 ft. long, at right angles to the strike, and consequently parallel to the dip and rise. The top of each face abuts on the lower waste side of the level above, at a distance of not more than 100 ft. back from the upper conveyor. Each section works in conjunction with the other, and is kept back or advanced so that this distance is maintained.

The stretch of face that is in advance of the conveyor line is worked as a two-roaded longwall section by hand to keep ahead of the conveyor, and is double-shifted. Pack walls in the conveyor face are built only on the

SKETCH OF ROLLER PATHS

SOME OF THE DETAILS OF CONVEYOR OPERATION top side of the main haulage level and in the advance face. On the whole length of the conveyor face no stone is built into position. The rock from the seam is cast back, but is not specially built into packs.

Instead a regular system of face timbering, that must be strictly adhered to, is in vogue. In this method props are set in line and at regular spacing up and across the face, the actual distance being determined by experience. This is maintained irrespective of the roof breaks, or any irregularity in the roof. Under the old system, patches of bad roof developed, but under the new arrangement, these seldom appear, and where they do, they are attended to not by putting the regular system out of line but by the addition of extra timber.

The object of this regular propping is to obtain and hold control of the roof. This has been successfully done, in a manner that could not be attempted before, and which was only made possible by the straight lines of the conveyor face. When the ordinary longwall working was in operation, the pressure of the roof was upheld upon a series of solid packs. This caused the pressure to exert itself in several directions simultaneously into the waste spaces, into the roads, into the opening between the coal and the pack walls, etc. These spaces were unequal in size and area, the supporting points were various distances apart, and so the pressure was unequally distributed, which in turn developed lines of force that ran apparently in any direction and were not, nor could they be, intelligently directed.

In the conveyor face, owing to the long stretch of free roof available, these lines of force are controlled and directed by the regular propping, and the result is the overflowing of the roof pressure in places designed for it—namely, the lower level and the waste space left behind the coal—and not into the roads and the actual working face where falls of roof can be well dispensed with.

The timber used at the conveyor is drawn as regularly as the conveyor is shifted, and as progress is more rapid than under the old system, the roof does not need to stand so long before the men operate under fresh cover. The setting of the props in a straight line, using timber pointed on the top, produces a "line of break" parallel to the face, and at each succeeding setting of the props the roof breaks at that point and falls into the waste, while the resulting pressure from the overhanging and supported piece has a beneficial effect on the breaking out of the coal. It is a fact proved in practice that this break can be accurately regulated so as to produce just the right pressure on the face of the coal.

Floor Is Lifted Instead of Brushing the Roof

At the bottom of the conveyor, or conveyor head, the layout of the roads is as shown in the sketch, and instead of the roof being broken to get the needed height the floor is lifted. The end of the conveyor projects over the roadway from the bottom of the seam, and is continually discharging into cars placed underneath it.

The amount of bottom that has to be lifted depends on the height of the cars in use; in this case 30 in. It must be lifted the full width of the double road. This will be understood when it is considered that the tonnage at this one point is 65, and that it is being delivered at a regular rate into cars, the arrival of which is intermittent. A double road is therefore necessary, both for storage purposes and to provide a passby for the empty and loaded cars. Horse haulage has been adopted from the conveyor head to the rope haulage in the "deeps."

In the operation of the conveyor face the number of men employed was somewhat as follows: Miners, 12; conveyor attendants, 5 per night; deadwork men, 2; timbermen are included with conveyor attendants.

Output, 55 Tons

In arranging the conveyor the machine is set up parallel to the line of the coal, a foot or so therefrom. A certain length of the seam is allotted to each miner, who commences at the top end of his particular length, with a breaking-in shot, if that is required. He afterward works downhill, loading out and breaking down with the conveyor operating past him, on his right- or left-hand side, but not at his back. On the 300-ft. face 12 men were at work regularly, this giving a space of 43 ft. to each man and a production per day of 55 tons.

Timber, tools and supplies come from the level above, and run down the conveyor to the man requiring them. Loading is continuous and from any point. Contrary to hand-mining practice, there has been no excessive loading periods. As a rule, and in this particular colliery, the "getting" on the whole length of the face is by contract. Otherwise it is only by measurement that each man's tonnage can be ascertained. Contracting puts each face output in the hands of one man, and the number of cars from each section can easily be reckoned at the haulage end by the usual means.

In this mine there are in all nine faces almost exactly similar. A feeling of friendly rivalry was introduced between the operators of the various faces, and at some periods of the year a bonus was paid the contractor who successfully extracted the greatest tonnage in any one fortnight. Generally speaking, the men welcomed the change from the old method to the new one. Contracting also was popular and satisfactory to both men and company. The men, after they had experience with the conveyor, were eager applicants for a contract, and the company had less overseeing work to do.

Shaking Conveyor Is Employed

The conveyor in use is of the shaking type, and has been adapted from continental practice. The height from the floor to the edge of the pan is only 9 in. This means that the workman is required to raise the coal only slightly over this height, instead of a former 29 in., which accounts for more work with decreased effort. The width is only 18 in., and this allows of the distance from coal face to waste line of props being kept at a minimum.

As shown, the conveyor rocks back and forth on rollers working in specially arranged paths. These are so designed as to cause the machine to fall sharply at the end of the forward stroke, whereby the motion imparted to the coal is continued in the material itself, while the conveyor draws back for the next stroke. The number of strokes is approximately 60 per minute, and the regulation of their length is an important feature in the design affecting the output and being influenced by the grade. In this case the grade is considerably in favor of the coal.

The principal dimensions of the driving engine are as follows: Horsepower of engine, 12; air consumption at

60 strokes per min. and 60 lb. pressure, 18 cu.ft.; stroke of engine, 5 in.; diameter of cylinder, 7 in.; weight of engine, 572 lb.

The theory of the machine is exactly that of a shaking screen. Movable sides are provided that can be taken out and placed across the conveyor, thus acting as chutes for the divergence of the coal or other material from the traveling pan. This has proved useful on not a few occasions, as any useless material can be readily shelved off the conveyor at any convenient point without the necessity of removing it by hand or loading it into cars at the foot, for disposal elsewhere.

The conveyor pan is built in 6-ft. sections which are easy to handle in confined spaces and simple to put together.

The engine, driven by compressed air, is a simple, plain, air cylinder, with broad bed-plate, which may be bolted to planks, which are in turn wedged against the roof by timber. The total width is 18 in., and the length 24 in. Connection to the conveyor is through a lever action and rigid attachment, the cylinder being placed at right angles to the line of the conveyor.

The pack walls on the top side of the driving road are uniformly built in line, 2 ft. or so back from the edge, this space being utilized for the engine. Air is furnished from a power-driven air compressor that stands in a little recess in the side of the road. The principal dimensions are as follows: Horsepower, 15; r.p.m., 960; amperes, 16.5; voltage, 500; cycles, 50; air pipe, 1½ in.; cylinders, 4; strokes per min., air cylinders, 480; pressure, 70 lb.; space occupied, 5 ft. 6 in. by 3 ft. 5 in. The air is passed through an 18-ft. hose to the air cylinder of the conveyor.

On the whole this arrangement has proved simple and reliable. The air cylinder is easily moved and held in position, while the air compressor may be shifted when the full length of hose is run out. The compressor runs on a bogie fitted with wheels to the gage of the road, and can, if desired, be placed in advance of the conveyor in the road driven ahead.

Rate of Advance Was Increased

The rate of advance changed from 160 ft. in six months under the old system to 270 ft. over the same period under the conveyor system. This is not remarkable compared to machine working advances, but it represents a considerably increased rate of extraction for handwork. The operation of each face in the colliery is regular and at the same rate, the only determining factor being the number of men employed.

Some extra organization is needed with such a conveyor face, in that it is necessary to see that the face is maintained in a straight line. This implies that it must be stripped every second or third day, depending on the rate of working from top to bottom. Otherwise there is left a "nose" of coal that interferes with the lining up of the conveyor when the time comes for shifting it. This coal has to be removed at the cost of extra labor and time.

Shifting of the conveyor takes place every second night, so as to get under the fresh rock as soon as possible; but this is governed by the rate of cutting and loading. The air engine is moved at the same time as the conveyor, but the compressor only when the length of hose is reached. The operation of shifting is accomplished by a night force of eight, who also shift the compressor when necessary and set all timber required.

Getting the conveyor ready for removal is done by unbolting the sections, after which whatever timber is to be moved is drawn section length, by section length, each section being in turn inserted in the space thus made, until the whole conveyor roughly occupies the new line, when the whole is again reconnected. The timber is again set section by section behind the conveyor, while the outside line, next the waste, now no longer required, is drawn. The original setting of the timber is done by the miners when working downhill in loading out the coal, the conveyor serving as the measurement line.

The opening-out section to the dip is operated at an angle to both the strike and dip and rise with the intention of causing any water made to gravitate to one point where it can be easily handled by a pump. Should the conveyor be placed at too flat an angle with the strike, it is apt to crawl up on the miners and has to be strongly stayed in position. There is also the trouble of the coal running entirely on one side of the conveyor and dropping over, if working extra full.

The exact angle at which the best and quickest work is performed is really a matter of experiment. There is no difference between the opening-out section and the other conveyor section in the actual operation method. It is true there are two fast ends, and consequently the coal cost is a fraction more than from the other faces; but it is much less than the rate formerly paid per ton for driving "deeps."

As this deep face proceeds it opens out on either side fresh conveyor faces that are ready to commence operations across the dip and rise without preliminary straightening or other work that would have been needed had the old policy been still in operation. The roof pressure is of course much greater in and about the center road; but once the roof has settled there is absolutely no further trouble.

Costs Were Decreased

A comparison of the costs of operation and performance accomplished by the old and the new systems has worked out much as follows:

	Hand Operation	Conveyor Operation
Tons, per man	3.2	4.6
Length of face	300 ft.	300 ft.
Tons, per section	45	55
Length of face, per man	43 ft.	40-50 ft.
Number of miners	14	12
Number of deadwork men	12	2
Number of conveyor men	...	1
Shifting conveyor	.. (Average per night)	4
Number of roads to maintain	7	2
Tons per road	6.4 Main level Bottom "	49.00 6.00
Time stripping	9 hr.	9 hr.
Distance bottom level in advance	....	40 ft.
Costs		
Cutting Shooting Loading	0.72	0.72
Brushing	0.41	(Done by squad shifting conveyor.)
Maintaining roads	0.08	0.08
Tramming	(Included with shooting and loading)	(Included for lower level in tonnage rate)
Shifting conveyor	....	.15
Operating conveyor	....	.03
	$1.21	$0.98

It will be seen that the saving in cost finally effected is entirely due to the elimination of roof troubles, which the conveyor system made possible. There are now installed 10 conveyor faces, and because of their success they are likely to be extended.

Coal Holdings of the New York Central R.R.

A phase of the New York Central's investments one hears little enough about is its coal-land holdings and developments. Few, if any, of these have reached the stage of paying direct money returns as dividends, and probably they will not for an indefinite time to come. The reason is that they have been acquired almost solely with a view to creating a fuel reserve for the Vanderbilt system. Cost of locomotive fuel or of power-house fuel, as the case may be, is becoming a more serious problem to most railroads every year. Apparently the Vanderbilt roads have solved it as far as it can be solved.

Among the investments of the Central is all the stock, $825,000, of the Clearfield Bituminous Coal Corporation, owning and controlling coal lands and mines in central Pennsylvania. It owns in fee 47,000 acres and leases 12,000 acres, besides owning the equity in various tracts aggregating about 80,000 acres subject to underlying mortgages. The corporation produces no commercial coal, its entire present output being taken by the Central and affiliated roads. The company does not wholly meet its fixed charges, but it is the means of assuring the eastern half of the system an ample fuel supply at reasonable prices.

West Virginia Properties

In 1905 the Pittsburgh & Lake Erie reached into the break-up of the ambitious Gould project for an eastern seaboard system and pulled out the remaining properties of the Little Kanawha Syndicate at a price approximating $8,600,000. These consisted of a variety of scattered short railroads in West Virginia and some really valuable coal lands. Subsequently the Pittsburgh & Lake Erie sold a half interest in these properties, equally divided between the Pennsylvania and the Baltimore & Ohio, practically at cost. The Monongahela R.R., which connects with the Pittsburgh & Lake Erie and is owned jointly by it and the Pennsylvania, has been extended south to the Pennsylvania-West Virginia state line. From that point the construction of the Buckhannon & Northern, one of the syndicate roads, has lately been completed to Rivesville, W. Va., and in the Fairmont district.

By means of the joint route just described and trackage over the Baltimore & Ohio the Vanderbilt lines and the Pennsylvania reach a tract of 57,000 acres of coal land about to be opened up. For portions of this tract the owners have been offered a price per acre that represents a valuation of $12,000,000 on the whole. The three big systems are working in harmony to divide the traffic here created, with the lion's share to the chief owner, the Central's subsidiary.

Sources of Coal Further West

Aside from the Fairmont tract, the syndicate holdings include at least one other West Virginia coal area of importance, besides odds and ends of railroad and right-of-way which will presumably become useful as the industrial development of West Virginia proceeds. In comparison with the value of the coal and that of a fuel supply, the carrying charges on the original investment are insignificant.

Further west there are additional coal reserves, the Big Four having recently acquired 37,000 acres and the Lake Shore 74,573 acres of coal lands in Illinois. The Lake Shore's purchase involved an expenditure of $2,399,659. Here, as elsewhere, the primary object of the acquisition is the assurance of an adequate fuel supply, though commercial coal is being produced from some of these properties.

Everyone knows that the New York Central lines are not largely carriers of coal; that is, coal is under 30 per cent. of their tonnage as against 50 per cent. to 60 per cent. for such coalers as the Baltimore & Ohio, Pennsylvania and Norfolk & Western. But everyone does not know that they have a firm foothold in the three most important coal fields in the country, with something like 300,000 acres of coal lands owned or under lease. Possibly they, with other railroads, will some day run up against an amended and fortified commodities clause, so far as the commercial working of these fields is concerned. But by that time the location of mine branches will presumably have assured them the traffic from these holdings or parts thereof under other ownership. It is not likely that they will be prevented from exercising the ordinary business prudence of retaining a stock of unmined locomotive fuel.—"Boston News Bureau."

Coal Resources and Imports of Chile

Coal mining in Chile has shown a steady development in the past 10 years, says Consul General Leo J. Keena in *Commerce Reports*. In 1904, 751,628 metric tons were mined in the republic, and in 1913, 1,283,450 metric tons. The 1913 production, while less than that of 1912 (1,334,407 metric tons), was 95,397 metric tons greater than that of 1911. The price of locally mined coal in 1904 averaged $4.38 per metric ton and in 1913, $6.94 per metric ton.

The following is a list of the coal-mining companies in Chile in 1913, with the location of the mines and their gross production in metric tons of 2204.6 lb.:

Companies	Location of Mines	Production in Tons
Anibal 20 Zañartu	Tome	2,000
Cia. Carbonifera de Lirquén	Penco	30,000
Cia. Minera de El Rosal	Penco	18,000
Cia. de Lota y Coronel	Lota	291,308
Cia. de Lota y Coronel	Coronel	41,692
Cia. de Lota y Coronel	Coronel	12,763
Cia. de Lota y Coronel	Coronel	14,017
Cia. Carbonifera y de Fundición Schwager	Coronel	370,000
Suc. Rojas Miranda	Lota	10,000
Cia. Carbonifera (Los Rios de Curanilahue)	Carampangue	11,977
Cia. Carbonifera (Los Rios de Curanilahue)	Lebu	183,673
Cia. Carbonifera Victoria de Lebu	Lebu	16,000
La Cia. de Arauco (Ltd.)	Carampangue	37,032
La Cia. de Arauco (Ltd.)	Lebu	180,270
Cia. Carbonifera (Los Rios de Curanilahue)	Lebu	49,828
Cia. Carbonifera Millahuillin	Valdivia	600
Agustin Ross	Punta Arenas	14,200
Total		1,283,450

These mines employed 8414 persons, of whom 5929 were underground workmen. The average daily wages paid for underground work were approximately $1 United States currency per day.

The imports into Chile of steam, gas and other coals during the past five years were as follows: 1910, 1,293,000 tons; 1911, 1,367,874 tons; 1912, 1,524,652 tons; 1913, 1,540,747 tons; and 1914, 877,650 tons. The quantity given for the year 1913 is in accordance with the annual statistical returns of the Chilean customs authorities and came from the following countries: United

Kingdom, 924,430 tons; Australia, 457,873 tons; United States, 98,979 tons; Germany, 45,477 tons; Belgium, 13,413 tons; Netherlands, 575 tons; total, 1,540,747 tons.

The quantity given for 1914, 877,650 tons, may be taken as a fair approximation to the imports for that year, though the official statistics are not yet available. The total may be divided as follows: English coal, 453,999 tons; Australian coal, 407,601 tons; United States coal, 16,050 tons; total, 877,650 tons. During the second half of 1914 the imports were as follows: Australian coal, 257,204 tons; English coal, 192,493 tons; United States coal, 16,050 tons; total, 465,747 tons. The statistics for 1914 have been obtained from commercial reports compiled in the port of Valparaiso, which is the center for the coal import trade of Chile.

Decline in Use of Permissibles

The total production of explosives in the United States during the year 1914, exclusive of exports, according to figures compiled by Albert H. Fay, of the United States Bureau of Mines, was 450,251,489 lb., or 225,126 short tons, as compared with 500,015,845 lb., or 250,008 short tons for 1913. The production for 1914 is segregated as black powder, 206,099,700 lb.; "high" explosives other than permissible explosives, 218,453,971 lb.; and permissible explosives, 25,697,818 lb.

The figures represent a decrease as compared with 1913 of 23,839,831 lb. of black powder, 23,932,573 lb. of high explosives and 1,987,952 lb. of permissible explosives.

Mr. Fay says: "In the year 1902 only 11,300 lb. of permissible [or rather short-flame] explosives were used in coal mining, whereas in 1913 the quantity of permissibles so used was 21,804,285 lb., as compared with 19,593,892 lb. in 1914. The quantity of permissible explosives used in the United States is larger than in a number of foreign countries. In 1912 it represented about 5 per cent. of the total quantity of explosives produced and in 1914 5.7 per cent. The total amount of explosives used for the production of coal in 1914 was 220,622,487 lb., of which about 8.9 per cent. was of the permissible class, as compared with 9.5 per cent. in 1913."

Reasons Why Anthracite Mining Is Expensive

There are some important differences in the cost of mining anthracite and bituminous coal with which the general public is not familiar. The following table shows the total production of explosives in pounds in the United States, according to the United States Bureau of Mines, and the amount of the various kinds of explosives used in Pennsylvania to produce 91,626,964 tons of anthracite coal and 172,965,652 tons of bituminous coal in 1913:

	Black Powder	High Explosives	Permissibles
All mines in the United States	194,146,747	241,682,364	27,685,770
Pennsylvania anthracite region	44,001,660	16,093,035	3,323,645
Pennsylvania bituminous region	14,652,931	696,162	6,715,028

Thus it can be seen that the anthracite region used almost as much "permissible" explosive in proportion to coal produced as the bituminous region. The presence of gas in sufficient quantity to be detected on an ordinary safety lamp makes the use of permissible explosives advisable, if not absolutely necessary, to prevent explosions being caused by the flame of the black powder so commonly used for blasting coal. The mining of anthracite consumed over three times as much black powder and 23 times as much "high" explosive as the mining of bituminous coal, despite the fact that only half as much coal was produced.

The figures given are probably reasonably correct, though the operators only know what powder they sell to their employees and keep no track of what is purchased from other sources. However, the amount so purchased is probably not large. Of course the larger consumption of powder partly arises from the fact that the anthracite miner "lets powder do the work." If the bituminous operator invariably shot his coal off the solid, he could pay his pick miners a lower rate per ton and would nevertheless pay them more per day if he could only sell the product. The greater consumption of powder in the anthracite region is therefore not without its advantages in the production of cheap, though less marketable, coal.

In addition to this heavy charge for explosives, anthracite has to be put through an elaborate process of manufacturing, and this is one of the reasons why 20 per cent. of the cost of preparing the coal for market is incurred after the coal has been removed from the ground. Great factories, called "breakers," erected for this purpose cost $200,000 to $400,000 and even $500,000. As compared with these mammoth structures the "tipples" of bituminous mines are relatively inexpensive.

Lake Vessels Transferred to the Ocean Trade

Following the decision of the Interstate Commerce Commission that package freight vessels owned by railroads on the Great Lakes must be disposed of, the roads have opened negotiations for the sale of their vessel property to ocean companies. The Erie Railroad Co. has already sold four and the Western Transit Co. is calling for bids for putting one of its ships in shape to go to the coast.

W. J. (Fingy) Conners, a millionaire of Buffalo and owner of a stevedore company operating in a number of lake ports, is at the head of a syndicate negotiating for the remaining package freight boats on the Lakes. Sixty-two package freight boats are affected by the commission's order.

The Erie has sold to William G. Davidson, president of the Staten Island Shipbuilding Co., the steamers "Owego," "George F. Brownell," "John G. McCullough," and "Granville A. Richardson." The "Owego" is 325 ft. long, 41 ft. beam, and 14 ft. deep, with a gross registered tonnage of 2611. The "Brownell" is a duplicate of the "Owego." The "Richardson" is 256 ft. long, 41 ft. beam, and 28 ft. deep, with a gross registered tonnage of 2237. The "McCullough" is 255 ft. long, 40 ft. beam and 21 ft. deep, with a gross registered tonnage of 1895. The "Owego" has been cut in two and is on her way to the coast. The "Richardson" and "McCullough" can go as they are. The "Brownell" is being remodeled at Buffalo, N. Y.

The ships that cannot be taken to the coast because of the limited size of the canals will remain under independent management. The ships that have been sold were built between 1888 and 1893. The newer boats, about 20 in all, are mostly too large for the canals.

Coal Handling at Panama

SYNOPSIS—This summer will see the completion of the two great coal-handling plants on the Panama Canal. The plant at Cristobal, on the Atlantic side, has a storage capacity of 400,000 tons, and that at Balboa, on the Pacific side, a little over 200,000 tons, divided into piles. The Cristobal plant will be capable of handling 2000 tons per hour and the Balboa plant about one-half that. The total cost, substructure and superstructure, will be about three and a half million dollars. Some wet-storage capacity is provided.

For military and commercial reasons it becomes necessary to provide in the Canal Zone great coal-handling plants. At this time it is not possible to estimate closely the quantity of coal these plants will handle yearly, but based upon the expected canal traffic and the amount of coal transferred at the entrance of the Suez Canal, it is assumable that in time the Isthmus may be expected to handle upward of one million tons a year.

Two plants are provided, one at Cristobal, Fig. 1, on the Atlantic side of the Isthmus, and one at Balboa, Fig. 2, on the Pacific side. The former will have a solid storage capacity of 485,000 tons, while the capacity of the latter will be 215,000 tons. This is based on short tons of 2000 lb. each, or on 40 cu.ft. per ton. If, however, the coal is divided into piles, as it probably will be, it will reduce the capacity below these figures. For example, in case the coal at the Cristobal plant is divided into 37 piles, the collective capacity will be not far from 400,000 tons. Of this storage capacity, and at the request of the Navy Department, 100,000 tons of wet storage is provided for at Cristobal and 50,000 tons at Balboa. The wet-storage capacity is to provide for the permanent storage of large amounts of coal without it being subjected to the deterioration in quality that occurs in long exposure to the air, and it also will avoid the loss in damage through spontaneous combustion, although the machinery is so equipped that burning coal may be easily transferred to places where it can do little damage. Wet-storage may not be used except in case of war.

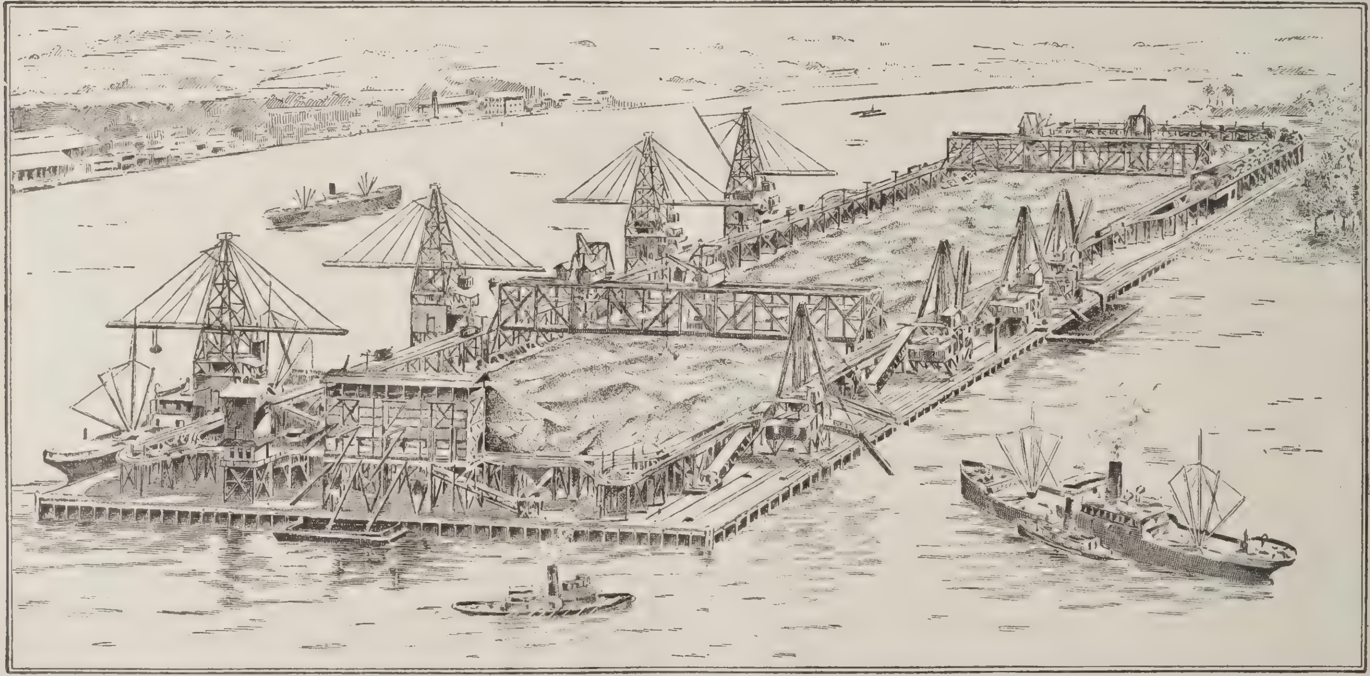

FIG. 1. COAL-STORAGE PLANT AT CRISTOBAL, CAPACITY 485,000 TONS

The plans and sectional elevations, Figs. 3 and 4, indicate clearly how the plants are laid out.

The substructure of the Cristobal plant is made up of three large wharves. One at the long side of the pier is designated as the unloader wharf, and at the other side is the reloader wharf. The connecting wharf between the two at the water end of the coaling plant is known as the end wharf. A depth of 41 ft. at mean sea level has been provided for a distance of 1965 ft. along the unloader and the reloader wharves, and also at the end wharf. The plant has about 2500 lin.ft. of berthing space, with 41 ft. depth at mean sea level, and as the tide does not fall more than one foot below sea level, deep-draft vessels can be accommodated at any stage of the tide. The decks of all wharves are 10 ft. 6 in. above the mean sea level.

Referring to Figs. 1 and 3, the coal pile is spanned by two movable steel structures, known as the stocking and reclaiming bridges, which are capable of traveling the length of the pile, or about 1000 ft. These bridges are of heavy steel construction and supported on 32 wheels at each end, the unloader wharf affording support for one of them and the reloader wharf for the other. These bridges are a little over 315 ft. long. The upper chord of each supports moving units known as bridge diggers, each of which consists chiefly of a bucket that can command any part of the storage pile. It will be seen from Figs. 1 and 3 that while the bridge moves longitudinally of the pile, the bridge diggers move longitudinally of the bridge.

On the unloader wharf there are provided four great unloader towers, a good view of which is shown in Fig. 3. These have a travel of slightly more than 1000 ft.

and command the length of deep-water berth on the unloader side of the plant. Their function is, of course, to unload coal from colliers and barges. The reloader wharf affords support for four moving units known as reloaders, and the maximum range of travel of these is such that they command practically all of the deep-water berth on the reloading side of the plant. The end wharf affords support for a wharf bunker of 15,000 tons' capacity, which is provided for the supply of coal to tugs and other comparatively small craft, thus making it unnecessary to start the plant to furnish small amounts of coal. The unloaders are operated by steam, while the remainder of the plant is operated by electricity. All parts are electric lighted throughout.

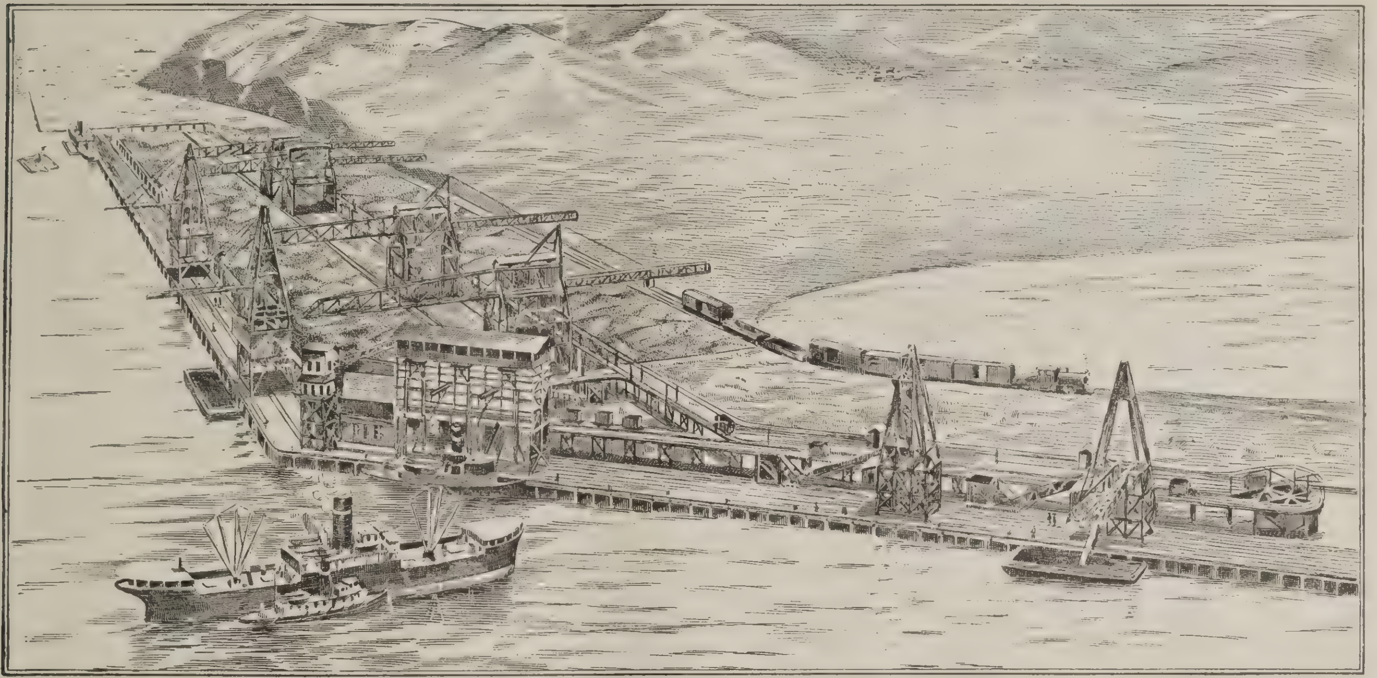

FIG. 2. COAL PLANT AT BALBOA, CAPACITY 215,000 TONS

The Panama Canal supplies electric current for the coal plant at 2300 volts to a substation on the west bank of the plant. The current is kept down to 440 volts for power and 110 for lighting, some of the necessary transformers being located in the moving units themselves and the remainder in the substation mentioned. The 2300-volt current will be supplied from the main Cristobal substation and will be brought to the coaling-plant substation, submarine cables being used to effect a crossing of the French canal which separates the coaling plant from the mainland.

An interesting point to note is that the tracks on stocking and reclaiming bridges are of the standard 5-ft. gage of the Panama Railroad, and they will be connected at the south end to the lines of this railroad. Thus there will be four parallel lines of standard-gage tracks extending the full length of the plant and connecting two of the main lines of the Panama Railroad. This will, of course, effect the convenient transportation of coal to and from the storage plant by rail.

Briefly, the substructure consists of steel and concrete decks supported by concrete cylinders 6 ft. in diameter, founded on solid rock. The spacing of the cylinders is largely dependent on the spacing of the rails for the support of the moving units, and the design of the deck framing has also been largely influenced by the position of the superimposed load. The deck-structure framing consists of steel plate-girders and beams. In all there was required about 5000 tons of structural steel and 18,000 cu.yd. of reinforced concrete. To support these decks, which have an area of about 200,000 sq.ft., 306 concrete cylinders, 6 ft. in diameter and ranging between 50 and 75 ft. in length, were required. These foundations were necessary inasmuch as the loads to be carried will, in many cases, be very heavy; for example, a load imposed on the substructure by one end of the stocking and reclaiming bridge can reach a maximum of nearly 1000 tons. The substructure of the Balboa plant is similar to that at Cristobal.

For loading and stocking, coal is taken from colliers or barges by one or more of the unloaders, which are equipped with $2\frac{1}{2}$-ton buckets and have a normal rated capacity of 250 tons per hour each, or the four unloaders at Cristobal have a combined unloading capacity of 1000 tons per hour. The coal is delivered to cars running on the elevated railroads. Each car has a capacity of 10 tons and runs at a speed of 200 ft. per min. The cars are stopped and started by a trackman on the viaduct, no attention being necessary when they are in motion.

As shown in the drawings, the cars open at the bottom and are dumped by the trackman. Throwing of switches is avoided, as the cars are started and travel to the desired point over a predetermined route. For stocking, the cars must dump at some point over the coal pile, and this is done from a track at about the level of the lower chords of the stocking and reclaiming bridges, which track is connected with one of the elevated tracks on the viaduct, paralleling the bridge track by means of a sliding switch that moves with the bridge and guides the cars onto the bridge.

The coal is reclaimed from storage by one or more of the four bridge diggers that run on the top chords of the restocking and reclaiming bridges. Each of these bridge diggers is equipped with a 5-ton bucket and has a normal

FIG. 3. PLAN AND SECTIONAL VIEWS OF THE COAL-STORAGE PLANT AT CRISTOBAL, PANAMA CANAL

capacity of 500 tons per hour, giving a total hourly capacity of 2000 tons. The reclaimed coal is delivered by suitable hoppers and valves in cars that transport the coal to the desired points, which may be near the unloaders, wharf bunkers, or to parts of the storage pile, by means of the stocking and reclaiming bridge.

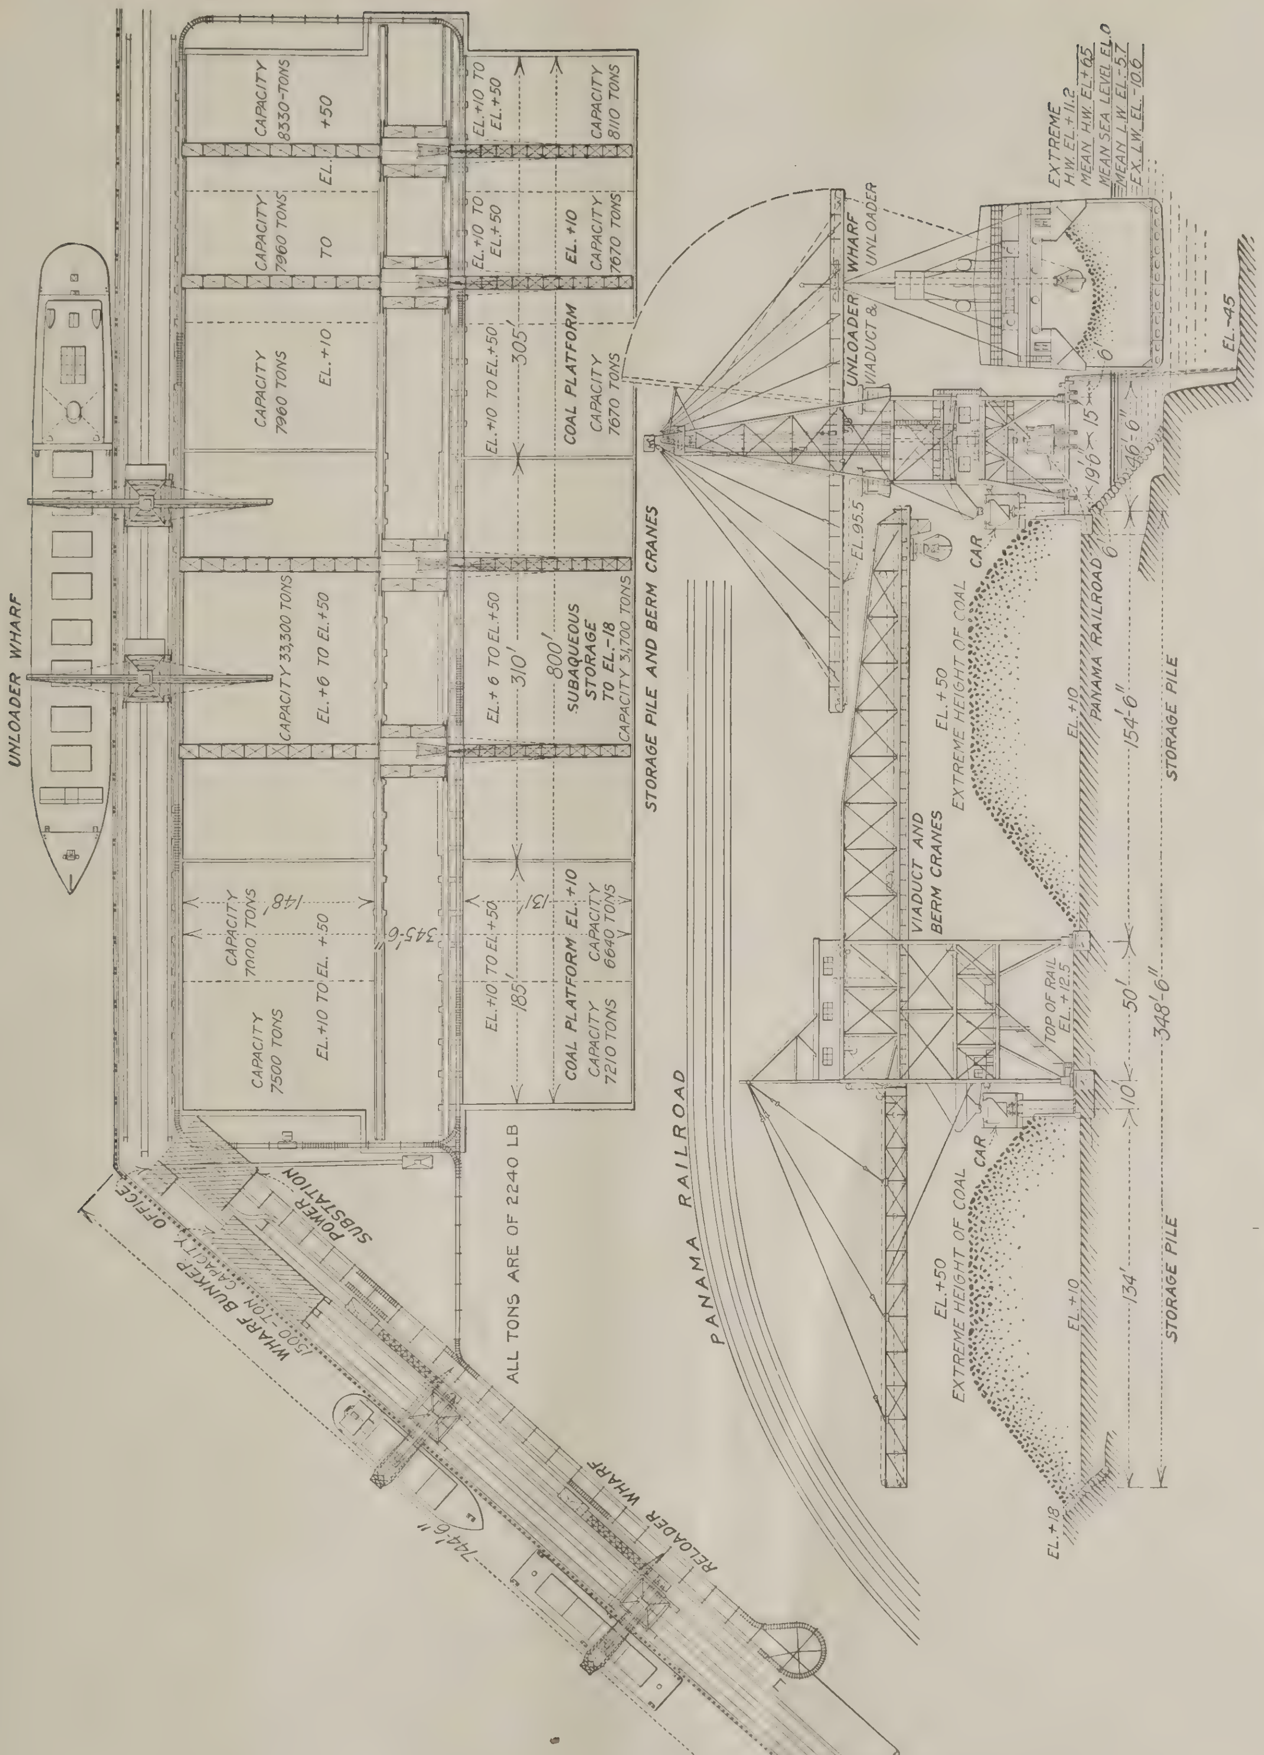

FIG. 4. PLAN AND SECTIONAL VIEWS OF COAL-STORAGE PLANT AT BALBOA, PANAMA CANAL

The wharf bunker receives its coal by means of a series of belts fed from a hopper into which the coal is dumped from cars. The reloaders are also supplied with coal by belts. Each reloader is provided with an appendage known as a trailer, consisting essentially of a hopper supported on wheels, which receives coal from the cars and delivers it to an inclined belt supported by a truss that connects the wheeled hopper to the reloader proper. The trailer therefore travels with the reloader. From this inclined belt the coal is delivered to a second belt, carried by the reloader proper, and supported by a hinged truss capable of considerable range of motion in a vertical plane and fitted at its swinging end with a hinged telescopic chute. The hinged truss and chute are raised and lowered by a steel-wire rope passing over sheaves secured to the tower structure and actuated by drums.

It will be seen that these reloaders have a considerable range of point of discharge and that they take the place of the heavy and expensive wharf bunkers usually provided in large coal-handling plants. They are comparatively inexpensive and afford a range in capacity of discharge equal to that of a high wharf bunker.

The coal is weighed by semiautomatic scales provided at points along the elevated railroad, and the operating routes are such that a car must pass over a scale before reaching its point of discharge. A set of standard railroad scales is also provided for the railroad track at the wharf level, so that the weight of coal delivered to standard-gage railroad cars by the unloaders may be duly ascertained and recorded.

Signals and Capacities

A complete system of communication and signals, both visible and audible, is provided. Electric illumination is profusely provided, so that work may be carried on at night. It is not expected that the unloaders will be able to be worked at the same capacity at night as in the day, but every signal device, illumination, communication, control, etc., has been provided to reduce the loss of time to a minimum.

To provide for the safety of those operating the machinery, it was specified that no operation calling for high speed should require the simultaneous thought or action of more than one man. In the design of the machinery, consideration was given to the possibilities of protecting operators from the fumes and gases when removing burning coal. It was also stated in the specifications that each plant and the arrangement and character of its component parts should be such that failure of one part only should not bring the entire plant to a standstill. This referred especially to the conveyor system, wherein bypasses, intermediate storage hoppers, parallel lines, etc., should be provided to enable the handling of coal into and out of storage to proceed continuously and at as great a percentage of the normal rate as practicable, in the event of a breakdown of any part.

The operations of which the various elements of the plant shall be capable are of interest. Each unloading tower is capable of mining coal from the vessels and depositing it in the hopper built into the tower, whence it may be delivered through chutes to the conveying system or to standard 5-ft. gage railroad cars. The tower must also mine coal from the vessels and deposit it by buckets or shovels on the storage pile behind the towers; and it must mine coal from the storage pile behind the towers and deposit it in the hopper built into the tower; and it must mine coal from the storage pile and deposit it by buckets or shovels aboard vessels.

Each stocking and reclaiming bridge must be capable of restocking coal into any part of the storage pile by means of a part of a conveyor system supported by the bridge, and must reclaim coal from any part of the pile and deliver to the conveyor system. In addition to this it must be capable of stocking and reclaiming simultaneously, each at full normal rated capacity.

Functions of Conveying System

The conveying system has many duties. It is capable of receiving coal from a single unloading tower, or group of towers located anywhere on the wharf and transporting it to any part of the storage pile. It also receives coal from a single unloading tower or group of towers located anywhere on the wharf and transports it direct to the reloaders, which may be spaced at any interval along the unloading wharf, and delivers it to one only, or distributes it among any number of reloaders. The aim is to distribute the coal approximately equally among any number of reloaders in action. The conveying system can also receive coal from a single unloading tower or from two towers located anywhere on the wharf, and transport it direct to the wharf bunkers. It was stipulated in the specifications that the capacity of the conveying system leading to the wharf bunker must be sufficient to handle the maximum discharge from two unloading towers. The system is capable of receiving coal from a single unloading tower or group of towers located anywhere on the wharf, as when unloading but one vessel and transporting it to any part of the pile, while at the same time coal is being reclaimed from any part of the pile and being conveyed to reloaders or to the wharf bunker. It also is capable of receiving coal simultaneously from two vessels located anywhere along the unloading wharf and transporting it from both vessels to the same part of the pile, to the reloaders direct, or to the wharf bunker direct. If coal from both vessels is being transported to the storage pile, it is possible simultaneously to reclaim coal from any other part of the pile, by means of running the bridge or bridges, and transport the coal to the reloaders direct, or to the wharf bunker direct. The system is also capable of taking coal from any part of the storage pile and depositing it at any other point of the pile by the use of the bridges.

The plant at Balboa has only about half the capacity both in storage and in handling as has the plant at Cristobal. From the foregoing description and from the illustrations the differences in the two plants are readily seen.

All of the machinery, with the exception of the six unloader towers—four for Cristobal and two for Balboa—were furnished by the Bergen Point Iron Works, the contract price being $1,347,392. The unloader towers were furnished by the Hunt Construction Co., the contract price being $485,736, making a grand total of $1,833,128 for the machinery. These figures, with a statement in the specification to the effect that "the fact that the cost of substructure which will be furnished by the Commission will be the greater part of the cost for the entire plant should be kept in mind in the design of the coal-handling installations," would indicate that the total cost of both plants exceeds $3,500,000.

⁂

Inspection of Illuminants in Alabama Mines—The law enacted by the legislature of Alabama in 1911, regulating the inspection and use of illuminants in mines and sales of illuminants for the use of miners, and devolving the duty of inspection upon the chief mine inspector, is constitutional. (Alabama Supreme Court, ex-parte Burgin, 68 Southern Reporter, 49.)

Meeting of the Rocky Mountain Coal-Mining Institute

Mention was made in an earlier issue of *Coal Age* of the summer meeting of the Rocky Mountain Coal-Mining Institute, which was held at Trinidad, Colo., June 8-10. A full account of the meeting was held over, pending the receipt of complete and corrected copies of the papers that were read.

The meeting was called to order by President Weitzel. The members were welcomed to Trinidad by Mayor Taylor and A. L. Bramson, the latter a representative of the local board of trade. The transaction of routine business occupied the morning session. In the afternoon R. C. Hills, of the Victor-American Fuel Co., read an interesting paper entitled "Coal and Coal Fields of the Rocky Mountain Region."

The second day of the convention was devoted to a trip to Cokedale, Segundo, Primero and Tercio in a special train over the Colorado & Wyoming R.R. On this trip were 290 members and friends. The party arrived back in Trinidad at 6 o'clock in the evening.

The third day was devoted partly to business and to the reading of a paper on "Advantages of Social Welfare" by David Griffiths. Following Mr. Griffiths' paper was another on "The Use of Electric Safety Lamps" by A. E. Thompson. The afternoon of June 10 was devoted to a visit to the Victor-American Fuel Co.'s mines at Hastings and Delagua. The party returned at 6 p.m. and attended a banquet at the Cardenas Hotel at 9 o'clock, 158 members being present.

The membership of the Rocky Mountain Coal-Mining Institute now totals 485, which is quite remarkable for the short time the institute has been in existence.

The paper on "Advantages of Social Welfare" by David Griffiths follows:

The word "welfare" has a broad, comprehensive meaning. The Universal dictionary defines the word as follows: "The state of faring well; a state of exemption from misfortune, trouble, calamity, or evil; the enjoyment of health and prosperity; wellbeing, success, prosperity." So the word "welfare" covers all that can be done for the protection, comfort and happiness of our coal miners and their families.

In no other line of endeavor during the past decade have corporate interests and employers of labor shown so much zeal and interest as they have in the welfare of their employees. It is a world-wide movement. Its object is to create harmonious relations between employees and employer for the purpose of obtaining greater efficiency and averting industrial conflicts. Much has been done toward this end for the coal miners of Colorado, and much more can be done that will stand to produce the desired results.

As an example of what can be accomplished along these lines, I will quote in brief an article that I read some months ago in one of our magazines:

> A few years ago an English syndicate purchased a large vineyard and orange grove in southern California. After the preliminary work of organizing, the directors of the organization selected an old English horticulturist of wide and varied experience in the plantations of the West Indies to take charge of the property. He in turn engaged several subordinate officers from the agricultural colleges who were theorists and not practical men. The manager and the overseers were paid a handsome salary and they lived on the fat of the land. To do the manual labor on the farm they hired about 200 coolie laborers to whom they paid 50c. per day and their maintenance. The laborers lived in hovels, shacks and dugouts that were vermin-laden and unsanitary.
>
> Their food was of the poorest and quite scanty. Year after year with theoretical management and coolie labor the enterprise was a financial failure. Finally the board of directors came to the conclusion that some kind of a change had to be made or dispose of the property. Rather than dispose of the property at a great loss, the board decided on placing a young, progressive American in charge of the property, who had but very little experience with grapevines or orange trees, but had made a study of the welfare of employees. He in turn selected two experienced grape and orange growers as overseers. Their first move was to provide the laborers with clean, wholesome and palatable food and plenty of it. Then they went to work and built commodious living quarters for about 80 men. After this was done they advanced the wages from 50c. to 75c. per day and started a system of elimination whereby the indolent, unclean and inefficient had to leave the service.
>
> While these improvements and somewhat drastic changes were going on, the board of directors were very uneasy. However, the manager insisted that the money expended and the changes made would in the end bring about the desired results. The first year under the new management a great sum of money was expended on betterments and equipment. The second year a small profit was made on the whole investment. The third year 75 men well-fed and otherwise comfortably provided for did all the manual labor on the farm with the exception of harvest time, and instead of having an overseer over 15 or 20 men the two overseers did all the directing. The manager and overseers dined at the same table as the laborers, and their living and sleeping quarters were alike. Peace, law and order reigned supreme. Harmony and mutual interest was their slogan. Now under the complete revolution of affairs the syndicate is receiving a handsome interest on the money invested, and they would not dispose of the property for double the money they originally paid for it. Moral: Treat your employees right and just and your success is assured; or, any reasonable amount of money spent on the welfare of employees is a good investment.

Granting that the foregoing illustration is an extreme case, if such good can be accomplished in other industries it goes without saying that much good can be done on the same lines in our coal mining communities. Some of you will be apt to say that the comparison is not well-taken and that there is as much difference between running a farm and a coal mine as there is between running a wheelbarrow and a linotype machine. However, I believe that you will all agree that the principles involved are similar in both cases.

Purpose of Welfare Work

This welfare movement goes under various names and is carried on in various forms, but it has one common purpose; that is to obtain the coöperation and good-will of the employees. If we hope for the movement to attain the fulfillment of its purpose the employee must receive just and honest treatment, he must be considered an essential factor for its success, and he must have some recourse for his real or imaginary grievances.

The success of the movement for the welfare of the coal miner does not depend so much on the owner, president or general manager as it depends upon the treatment of the employee by the local management. It is surprising what ill-feeling, bitterness and hatred can be created by an irate superintendent or mine foreman when dealing with his subordinates.

It cannot be expected that the employee will be loyal if he is abused and brow-beaten by his superior in office. We do not want to forget that the men in subordinate positions are human and should be treated as such and that an Italian, Greek, Jap or Negro, or any other man irrespective of nationality, color or creed, if worthy of being in the service in any capacity, is entitled to a civil answer and courteous treatment.

Under no circumstances or conditions has a superintendent or mine foreman the right to abuse or ill-treat an employee. The boss at all times has the right to advise, to censure and even to dismiss from the service men who have violated any law, rule or regulation whereby their own lives or those of their fellow-workmen are jeopardized. To the unemployed, as well as to the employed, the superintendent should be courteous and civil; especially should he be so to a man when he is seeking work. The sober, honest, industrious workingman is not seeking work from choice, but from necessity, and as such he deserves sympathy and a patient hearing. We ought to remember and practice the wise proverb, "A soft answer turneth away wrath, but grievous words stir up anger."

Clerks and weighbosses should be civil and courteous to all employees, as an offensive word from them is ofttimes far reaching in its evil effects. Our camp-store manager, as a rule, is a much-maligned man and he has an uphill job to counteract the prejudice against the company stores. However, he should at all times be civil and courteous to his patrons, not only for the sake of their patronage, but because of the evil influence any other course will have upon all employees.

Camp physicians should not only be attentive, but sympathetic, as a kind word in time of affliction goes a long way toward bringing about happy relations between employee and employer. I think that just, honest, kind and sympathetic treatment of the employees is the principal factor of success in any of our mining communities. Never has there been a truer saying than that made by the immortal Bobby Burns, "Man's inhumanity to man makes countless thousands mourn."

NEED OF DECENT SURROUNDINGS

The safety and sanitary conditions of our mines are not perfect, but considering the adverse geological conditions and the comparatively short period of experience in coal mining they will compare favorably with older countries. If we expect to gain the good-will and confidence of the employee we must provide for him healthy and sanitary conditions to work in and be ever careful and vigilant as to the protection of his life and limb.

I believe that the dwellings in our coal camps will bear favorable comparison with any of the coal-mining communities in any of the other states in the Union where the mines have been operated for the same length of time. In the early history of coal mining in Colorado, and I presume in all other states, the pioneers of the industry had to live in tents, adobes, dugouts or log cabins.

Colorado's climatic and topographical conditions are not very favorable, her populace are varied and transient, and water, the life-giving element, is scarce and difficult to obtain at any cost. In some of our coal camps, however, where conditions are favorable and where the life of the mine will justify the expenditure, I think it would be a good move to give our wives and daughters modern conveniences in the home. If pantries, clothes closets, screened doors and windows, water in the house, sewer connections, etc., are essential in other communities they are also essential in our coal-mining camps. I do not know of any people who are more deserving of such modern conveniences than the wives and daughters of our miners.

The bath-houses that have been built in our various coal camps have removed a great drudgery from our homes and are much appreciated by those who are favored with this modern convenience. Recently much attention has been given and much work has been done in fencing and arranging for lawns and gardens around the dwellings. The beautification of our environment will tend to draw into our communities a better class of workmen and will encourage thrift and individual responsibility. There is no doubt that the man who spends his time at the altar of Demon Rum or in absolute idleness when not at his regular work is not as good a citizen and not as desirable a workman as he who spends his spare time in his garden among his flowers or in otherwise improving his surroundings.

THE ADVANCE OF PROHIBITION

The use of alcoholic liquors and the toleration of saloons in our mining camps is a menace to their prosperity. I am glad to say that the days of the saloon in Colorado are numbered and that prohibition is gaining ground the world over. The Russian has given up his vodka, the Frenchman his absinthe, the Englishman has made the price of liquor prohibitive and the American Navy has abandoned the use of whisky; to cap the climax, Colorado has gone dry and placed in her statutes one of the strongest prohibition laws in existence.

With the removal of the saloon from our mining camps will come the necessity of providing suitable places for the relaxation of the mind and body of our coal miners. With this end in view, clubhouses, moving picture shows and playgrounds have been advocated. Some of the clubhouses are now in operation and others are in course of construction. Moving-picture shows are shown weekly in the southern field, and playgrounds for young and old are being made in many of our camps.

Probably a word of explanation on the clubhouse movement would not be amiss. The clubhouse is erected by the company and turned over to the employees free of rent. Light and fuel are furnished free. For the purpose of encouraging thrift and collective responsibility the management and control of the club are left entirely in the hands of the employees. The movement as yet is in the experimental stage, but it is the general opinion among employees that it will prove to be a success.

Moving-picture shows, if conducted on sound lines, can be made very instructive. It is the silent pedagogue of the age. The anti-fly, pure milk, anti-drunkenness and social justice films are the most powerful teachers in the country. The drama films encourage kindness, virtue and courage. The life of a miner at best is serious and solemn, so a good sprinkling of humorous films, like "Tillie's Punctured Romance," would be very agreeable in our coal camps, for a good hearty laugh is often much better for the human system than the doctor's pills. The moving-picture shows in our isolated mining camps are well patronized and are a source of good clean amusement.

EDUCATING THE CHILDREN

I have every reason to believe that the education of our children in the coal-mining camps is as efficient and thorough as it is in any other community, but I am inclined to believe that we have too many abstract themes and theories and that we are losing sight of the practical and applicable side of life. Education is an achievement, and to obtain it you must strive for it, and what is the use of our sons and daughters striving for education if it cannot be made helpful to their future existence.

What is the good of a workingman's son or daughter mastering geology, trigonometry or astronomy if he or she cannot make a living from it? Would it not be much better for our daughters to be taught how to make a palatable and wholesome layer cake than to be able to enumerate the sedimentary rocks in the Cretaceous period? Would it not be better for them to know of the hardy cereals and vegetables that will grow prolific in our arid lands than to be able to classify the flora of the Carboniferous era? Would it not be better for them to know how to mix and bake a baking of bread than to be able to take a theodolite out on the plains and calculate the altitude of Pike's Peak by trigonometry? It would be far more serviceable for them in future life to be able to trace a pattern over a piece of dress goods and know how to run a Singer sewing machine and make the lock and hem stitch so as to be able to make their own skirts and dresses than to be able to trace the elliptical orbit of Halley's comet in space.

I do not wish to be understood that our sons and daughters should be debarred from getting such special knowledge as I have mentioned; indeed, they should be encouraged to do so if they show any inclination or aptitude for such special knowledge, providing that their chances would be good in the future to make a living from what they had striven so hard to obtain. However, happy indeed is the possessor of the knowledge of the varied themes and theories that are taught in our schools, because a broad education makes us bigger and better and happier, and coal miners' children are as much entitled to these enjoyments as anyone else.

YOUNG PEOPLE'S ORGANIZATIONS

The Sunday School, Boy Scouts and Camp Fire Girls in connection with this welfare movement are deserving of more than a passing remark. They are the coming Americans. To them we must look for the permanency of the movement. Into them are imbued the physical, mental and moral qualities of mankind, and in years to come the result of their training will bear fruit.

The past legislature has aided the welfare movement by giving us the industrial commission and the compensation laws. It is too early to criticize or pass judgment as to the efficiency and equity of the said statutes. However, similar laws are in effect in other sections of the country and have proven to be effective in preventing industrial troubles and rendering aid to the needy in time of affliction.

A SOLUTION FOR MANY TROUBLES

Treat your employees honestly and justly; protect and safeguard them while at work; give them comfortable homes to live in; remove alcoholic liquors from our camps and give their children education on practical lines, and our miners, or the majority of them, will be contented and our homes will be havens of happiness. To the extent in which we succeed in this will we make our coal-mining communities immune from the ravages of industrial conflicts and their evil consequences. It is my firm belief that in the camps where this welfare work will attain the highest degree of perfection will be found the most desirable workmen and the best citizens, and the financial success or failure of operations will be measured accordingly.

It is not to be expected that we will ever attain to Tom Moore's utopian standard of conditions in or around our coal mines or that our coal miners and their families will ever be as happy as the flock herders of Arcadia, but much can be done to bring about such conditions so that all the powers of the Black Prince cannot sever the harmonious relations between the contented employee and the kind and honest employer.

In conclusion, I wish to say that nothing is too good for the honest, industrious coal miner and his family. I have confined these disconnected remarks on welfare of coal miners to the State of Colorado, and more particularly to the company that I have the honor to serve. I hope and trust that they will be accepted in the same spirit as I have written them and that they will aid in bringing about happier and closer relations between employee and employer.

[*The other papers, "Coal and Coal Fields of the Rocky Mountain Region," by Mr. Hills, and "The Use of Electric Lamps," by Mr. Thompson, will appear in "Coal Age" next week.—Editor.*]

Ballads of a Coal Miner--IV

The Wise Guy

Written Expressly for
Coal Age

By BERTON BRALEY

* * *

"YOU can't tell me nuthin'," the pitboss, he says;
"You can't tell me nuthin' a-tall,
I don't need advice from no hunkies like you—
An' if I do need it, I'll call;
I guess I kin tend to my business o.k.
Without no attention to nuthin' you say.

"You can't tell me nuthin'," the pitboss, he says;
"I reckon I'm on to my job,
An' I'll thank you to keep your suggestions to home,
You miser'ble ignorant slob;
I haven't no time fer to hear your idees;
I guess I'm the boss an' I'll do what I please."

Yes, that was the way that the pitboss come back
When I made a suggestion, polite,
But the Super he heard what the pitboss had said
An' he wasn't contented—not quite.
"Hold on there," he says, when the pitboss got through,
"I guess I'll horn in with brief word or two."

"They can't tell you nuthin'," the Super repeats,
"Then Lord help you, brother," says he,
"For the guy who imagines he's knowin' it all
Aint quite the right pittboss fer me.
If YOU can't learn nuthin' from no other man,
I'll go get a feller for pitboss who can.

"We haven't no use fer the feller," he says,
"That thinks he has knowledge to burn,
Who scorns all suggestions that comes from his men
An' won't never listen an' learn.
'They can't tell *you* nuthin'—them words makes me tired,
An' I'll tell you something right now—you are fired!"

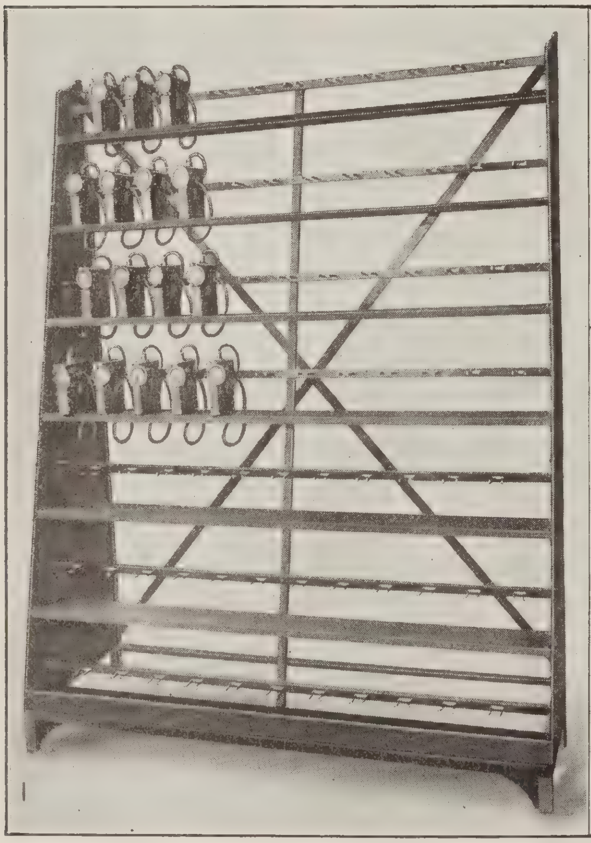
A New Electric Safety Lamp

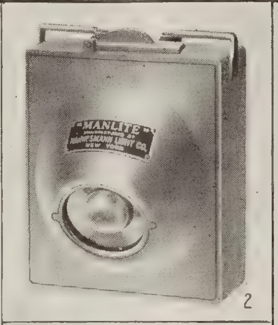
SYNOPSIS—A lamp based on the design which received first prize in a recent British competition has been entirely remodeled. It now not only appears as a cap lamp, but is much lighter than before. The manufacturers are willing to lease the lamps, agreeing in their contract to charge, clean and maintain them for every shift.

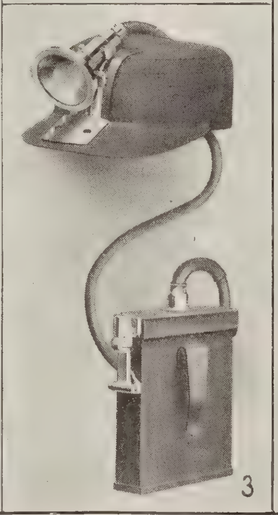
The United States Bureau of Mines has just awarded approval No. 11 to the Manlite electric safety mine light. This approval covers not only safety, but efficiency and practicability in general service. The lamp is manufactured by the firm which a few years ago introduced the Ceag electric safety hand lamp.

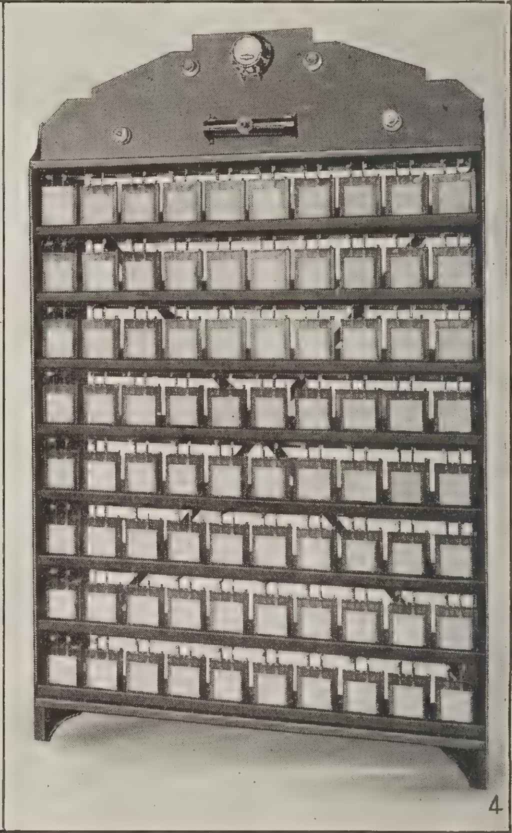
Improvement of Battery with Use

The lamp was approved only after passing exhaustive and severe tests in accordance with the exacting conditions which have been formulated by the engineers of the Bureau of Mines which are set forth in schedule 6A.









MANNESMANN MINE LIGHTING EQUIPMENT

Fig. 1. Lamp rack. Fig. 2—A lamp for use on a mule. It throws the light at the correct point on the track. Fig. 3—Lamp as worn on cap with battery for attachment to belt. Fig. 4—Charging rack

The lamp complete, including the battery, cable and head piece, weighs only 3½ lb.; of this the head piece weighs only 4 oz. The light is brilliant, but soft, and at the same time absolutely steady and unflickering for at least 12 hr. per single charge of battery. The curves of discharge of the latter on page 219 show how it improves in service.

On the first discharge the voltage falls to 1.8 in a little more than 8 hr. The second discharge reaches the same point in a little over half as long again. The progress is thereafter not so rapid, but by the twelfth discharge the voltage is maintained at over 1.8 for more than 15½ hours. By the thirty-seventh discharge that period is extended over the sixteenth hour.

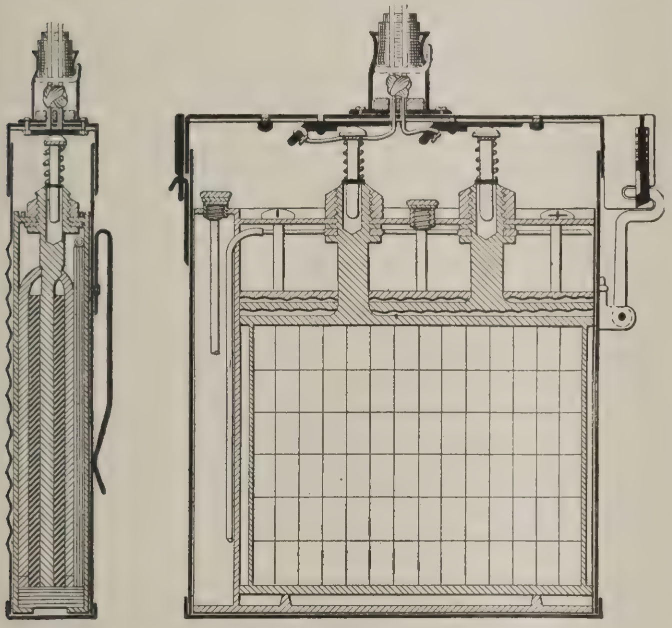
But these curves are based on a discharge of 1 amp., whereas the lamps only use 0.78 to 0.83 amp., and consequently the voltage is maintained for much longer periods than those mentioned. The curve of charge with 2 amp. on page 220 shows a slow increase in voltage till the fifth or sixth hour, when the rise becomes quite rapid till the seventh hour.

The batteries will supply light after 10 charges and discharges for 20 hr. at a stretch. This is not shown merely by laboratory observations and by deductions from curves, but by tests duly authenticated by mining companies which have used the outfits. This remarkable result is obtained despite the light weight of the battery.

The battery is of the lead-sulphuric acid type, the plates or electrodes being designed and constructed with a view to long life and dependable service. These plates are contained in a transparent case of remarkably tough and flexible material, which successfully withstood the dropping tests conducted by the Bureau of Mines under schedule 6A.

The use of a transparent container is a distinct advance in this type of accumulator construction, as it permits the attendant to observe at all times the condition of the electrodes, the quantity of precipitated sediment and the level of the electrolyte, all of which have an important bearing on the service rendered and on the life of the plates of any storage battery. No other electric mine cap-lamp battery on the American market possesses this highly desirable and important feature.

The container is also absolutely non-spillable, being fitted with a unique siphon device which prevents the spilling of the electrolyte irrespective of the position in which the battery may be placed. The battery container proper is carried in a case constructed of nickel-steel. It is of rigid construction and exceptional strength and is fitted with a self-contained magnetic lock which can only be opened in the lamphouse. Thus the miners are prevented from tampering with it. The entire battery and case is so convenient and light in weight that miners have declared that after a few hours' use they are not aware that they are carrying a battery on their belts.



CROSS-SECTION OF BATTERY WITHIN NICKEL-STEEL CASE

The conductor cable is of a special alloy of the highest conductivity and flexibility and is highly insulated. The cable is inclosed in a chrome-leather sleeve possessing great durability. The head piece, carrying the bulb, is unique in its simplicity and remarkable for its sturdy construction and extremely light weight. The shank of the head piece carries a safety device which absolutely prevents the ignition of explosive gases or mixtures even though the head piece be completely shattered.

The bulb employed, and approved by the Bureau of Mines, has a guaranteed life averaging 600 burning hours. It is held in the burning position by a perfectly ground crystal lens carried securely in place by the lens holder, the whole being sealed so that the miners cannot tamper with it.

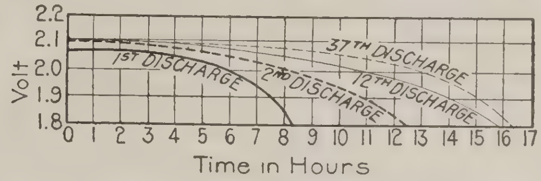
Miner Cannot Use Battery as Cigarette Lighter

There are no exposed terminals or parts of the entire equipment from which a spark or arc can be drawn, and the miner has access neither to the battery, conductor cable nor head piece and can extinguish the light only by breaking the lens. The outfit is therefore absolutely foolproof, as well as proof to dust and water.

The factors in this mine lamp which appeal to the practical mining man are safety, brilliancy and steadiness of light, simplicity of construction, economy in maintenance and adaptability to withstand rough usage. The equipment at the same time is no impediment to the miner when working.

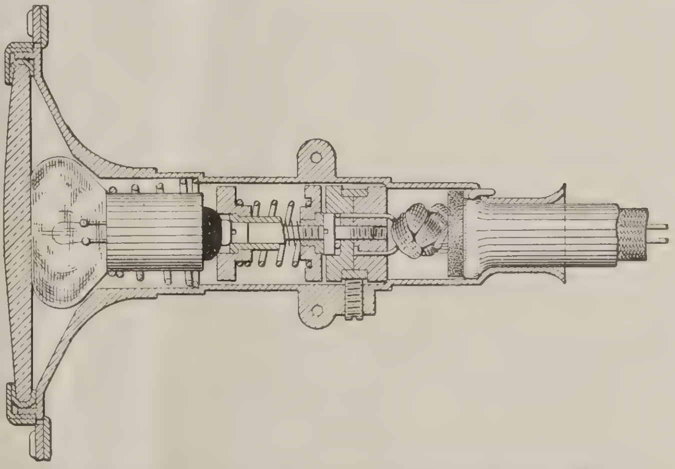
The fact that the lamp has been approved is a guarantee that it is absolutely safe even in the presence of explosive gas. The further fact that some thousand of these lamps have already been in continuous use for several months by the foremost mining companies is a convincing assurance that the lamp is efficient and practical in general service underground.

Accurate figures of the actual cost of upkeep of the lamp in continuous practical service for periods ranging from six months to over a year at various large mines have been collected. They prove that the cost of material per lamp shift does not exceed 1½c. In a lamphouse operating 320 of these lamps during five months past no battery repairs or renewals were required aside from a small quantity of electrolyte. The cost of other mechanical repair parts for the 320 lamps amounted to only $15.25. *Coal Age* is not allowed to publish these figures, but has inspected them, and they will be furnished by the manufacturer to anyone desirous of installing such equipment.



CURVES SHOWING HOW BATTERY MAINTAINS ITS VOLTAGE FOR A LENGTHENED PERIOD AFTER REPEATED USE

The equipment is sold at a reasonable figure, and the cost of renewal and repair parts is equally low in price; for instance, the cost of a positive plate approximates 50c., while a set of negative plates costs $1.

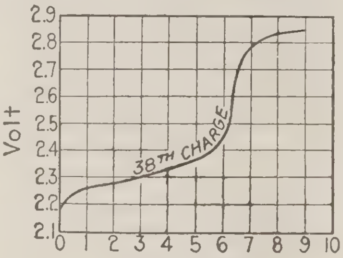


LAMP SHOWING THE DEVICES WHICH SHUT OFF CURRENT AND BREAK FILAMENT WHEN BULB IS BROKEN

Use in a Steeply Pitching Coal Bed

Among the mines using these lamps and presenting the greatest working difficulties is the Vulcan mine, of New Castle, Colo. operated by the Rocky Mountain Fuel Co., one of the most progressive operating companies of the West, which has had an extended experience in the use of electric mine lamps. The seam being worked at the Vulcan mine has an inclination of over 45 deg., but notwithstanding such adverse conditions, an equipment of these lamps in service for six months showed an average upkeep and repair cost of less than 20c. per lamp per month.

The service obtained with any electric miner's safety lamp depends entirely on the handling of the lamp and equipment. This has led the firm making the lamps to introduce a renting service. This saves the large expenditure of money involved where lamps are purchased outright. It also eliminates for the mining company the trouble of maintaining the lamps. When so rented the lamps and equipment remain the property of the manufacturer, who is bound by contract to deliver first-class lamp service, and also to furnish men to attend to the lamps. A suitable lamphouse, with hot and cold water and electric current, is furnished by the mine, and a small amount per lamp shift is paid as rental to the leasing company by the operating corporation. This system has given much satisfaction to the Keystone Coal and Coke Co., of Greensburg, Penn., among others. After a lamp cabin with a few hundred lamps had been operated by the manufacturer for this company for several months, at one of its mines, two additional mines of the same company were similarly equipped on a rental basis. The lamp is made by the Mannesmann Light Co., 329 Fourth Ave., New York City.



CHARGING CURVE OF MANLITE BATTERY

Electric safety lamps require the attention of trained electricians—reliable men who know all about the handling of accumulators. The Mannesmann Light Co. has a staff of such men who have been thoroughly trained in its own factory, and these men when running a lamp cabin will save money for the manufacturing company renting the lamps, thus enabling the rental to be put at what would otherwise be an unremunerative figure. There can be no doubt that the new method of renting will hasten the use of electric lamps in America and so advance safety in coal mines.

The Labor Situation

SYNOPSIS—John P. White declares that he does not desire a strike in the anthracite region and believes the men will secure adequate concessions without it.

The statement issued on July 27 by John P. White, president of the United Mine Workers of America, is so creditable to him and his organization that it is repeated in full:

"Articles appearing in certain newspapers during the past few days, for the most part published a great distance from the anthracite coal industry, which contain the information that the anthracite mine workers are making huge preparations for a big strike at the expiration of the present agreement Mar. 31, 1916, are absolutely unfounded.

"The campaign now being conducted in the anthracite region is for the sole purpose of uniting men of the mines as members of the United Mine Workers of America. When the anthracite miners have perfected their organization, I am of the belief that the union will be sufficiently strong and efficient to command the respect and recognition it deserves.

"I have every reason to feel assured that the operators, like the miners, want to be fair, and consequently I am at a loss to understand why the attempt in some quarters is being made to misrepresent the real purpose of our present membership campaign.

"Neither the International nor the district officials have formulated any plan that contemplates a strike at the expiration of the agreement. We are, on the other hand, hopeful that we will enjoy the opportunity to meet the operators in conference and reach a fair agreement embracing needed reforms and betterments that we feel quite confident the general condition of the industry will permit.

"The public should not become alarmed at the stories of a strike nature, for the mission of the United Mine Workers is one of peace, and I predict that such will be the outcome of our negotiations when we again meet the operators."

Central Labor Union Wants Help of Miners

On July 25 Steve McDonald, president of the Scranton Central Labor Council, made a strong plea before the convention of District No. 1 urging the miners to coöperate with other trades unionists in Scranton. So far the miners have never aided other labor interests by sympathy strikes nor have they been so aided, and the very nature of the contracts they seek to make would prohibit such action. To do as suggested would be to take a backward step.

But nevertheless McDonald would have them take it. "We should coöperate now," declared McDonald, "so that when the time comes to strike the enemies of humanity, it will not be necessary to appear before you to solidify your ranks." He urged that the strike of 1902 was won by the miners because the other labor elements had aided them and because financial assistance had been granted them throughout the country.

The speech of McDonald appeared to be a threat to make the strike in District No. 1 cover all the trades in that district and not merely a strike of miners, provided the latter and their employers could not come to an agreement. There seems to be a movement on foot to permit the Central Labor Council in the district to take up the disputes with the operators and decide them in place of the conciliation board.

The cry of labor solidarity always has a strong appeal, and it did not fail in this case, for the remarks of McDonald were loudly applauded. It is doubtful if the leaders of the miners are likely to be pleased, and it is extremely questionable if plasterers, masons, hodcarriers, carpenters and what not can help decide what miners should do, should concede and should demand. Clearly such an affiliation is another case of absenteeism; even the advocates of the miners are to be men who cannot tell a pick from a mattock. The miners have been storming at mine foremen who have never dug coal; now they are apparently willing to surrender leadership to men who never entered a shaft.

And yet like many other matters this would not be without advantage to the public, for the miners would then be restrained from too liberal demands by the interests of workmen who, engaged in other trades, look upon coal, not as a source of income, but as a large yearly drain on the family purse. However the workmen of the anthracite region realize that large wages paid by those outside the district are a source of prosperity to those within, and the solidarity might array all trades against the consumers both poor and rich in distant farms and cities.

Miners Seek To Keep Their Officials from Peculation

The union miners in District No. 1, having found that the peculations of their officers have caused defections to the Industrial Workers of the World, are determined to prevent them by bonding their local treasurers for twice the money handled at any one time and by securing the financial secretaries with a bond for $300. A resolution to that effect was passed by the convention. It is said that the Old Forge local union has lost $1200 by a defection of the treasurer, and many members are now followers of the I. W. W. in consequence.

The miners desire to get a compensation agent who can not only talk English, but Polish, Slavish, Italian, Russian and Hungarian, and who will issue the provisions of the act in those tongues. Linguists of such broad scope are in large demand everywhere and are not likely to be secured by the miners, but the demand for translations of the law are both feasible and to be applauded. In fact, the state might well undertake the work.

The Tridistrict convention in which will be represented all the union mine workers in the anthracite region, comprising districts 1, 7 and 9, will be held in Wilkes-Barre Sept. 7, according to a notice sent out by the district presidents and secretaries. This will prepare the demands to be made on the operators for a revision of the contract which will expire on Mar. 31, 1916.

Death of Frank A. Hill

This article was prepared for *Coal Age* by W. J. Richards, president of the Philadelphia & Reading Coal & Iron Co., and Baird Halberstadt, mining geologist, of Pottsville, both of whom were lifelong friends of Mr. Hill.—Editor.

Marked ability; wide experience in geology, mining and business; sound judgment, kindly frankness, absolute truthfulness; loyalty to his employers, his employees and his friends; devotion to his family; consideration of the feelings of others, and intense patriotism were the striking characteristics which made it possible for Frank A. Hill throughout his life to command the respect and esteem of all with whom he came in contact.

FRANK A. HILL

Mr. Hill, whose death occurred at twilight July 13, 1915, at Pottsville, Penn., was born at that place on Jan. 30, 1858. He was the son of the late Charles M. and Maria G. (Ayer) Hill. He came of a family that had long been connected with anthracite mining, his father having for many years been actively engaged as an operator and superintendent, operating the Oak Hill and other collieries in the southern anthracite field.

Frank A. Hill was educated in the private and public schools of Pottsville, graduating from the high school in 1875. Upon his graduation, he was appointed a chainman on the engineer corps of the Philadelphia & Reading Coal & Iron Co. under Gen. Henry Pleasants. With this company, he remained until the organization of the Second Geological Survey of the anthracite fields in 1881, when he was appointed as an assistant to Charles A. Ashburner, geologist in charge.

Mr. Hill's first geological work was in the Panther Creek district. Upon the organization of the other districts, he was assigned to the northern coal field in charge of the work, with headquarters in Wilkes-Barre, and later at Scranton. In 1885, he was transferred to the headquarters of the survey at Philadelphia, and the conduct of the work in the entire anthracite region was under his direction. In charge of this work, he remained until 1890, when he was made superintendent of the Dunbar Furnace Co., in Fayette County.

A short time after assuming charge of the furnaces and mines of the Dunbar Furnace Co., there occurred the disastrous fire at the Hill Farm mine, resulting in the death of 31 employees. Mr. Hill's heroic conduct in attempting to rescue these men alive called forth the highest praise, not only from the Government inspectors, but from the officials of the labor oganizations and the relatives of the entombed men.

Resigning his position at Dunbar in 1893, he was elected vice-president and general manager of the Southwest Virginia Improvement Co. With this company he remained until 1895, when he resigned to accept the office of general manager of the Hull Coal and Coke Co., with headquarters in Roanoke, Va. With this corporation he remained until 1908, resigning to become resident director of the mining interests of Madeira, Hill & Co., establishing his headquarters in Pottsville. It was this position he held at the time of his death.

In October, 1893, Mr. Hill was united in marriage with Alice Marie Müller, of Joliet, Ill. To this union were born three children—Frank, Marie and Alexandria, who with his widow and sister survive him.

The funeral services, held at his late residence upon Friday afternoon, July 16, were attended by prominent coal men from all parts of the Eastern United States. Interment was in a plot recently selected by himself in the Charles Baber Cemetery, at Pottsville.

In the death of Mr. Hill, the coal industry as well as his friends, whom he numbered by the thousands, has met with a severe loss.

The following editorial by H. I. Silliman, editor of the Pottsville *Journal,* shows the high esteem in which Mr. Hill was held by his fellow-townsmen.

"Frank A. Hill, whom God has seen fit to take from this community, was an unusual man—a man possessed of so much in high and splendid qualities that one felt honored by his friendship. He stood for so much in manhood; his manner was so gentle, but withal he was so virile that it is hard indeed to pen a proper appreciation of him.

"Frank A. Hill was a leader of men. He led them by the force of his dominating ability and his gentleness. He won the confidence of all men because there was something about him that seemed to speak out to you and say, 'Here is a man; mark him well.' He had no quarrels with the world; if he could not speak well of a man he did not speak ill of him. He was always arrayed, in all the strength of his fine manhood and courage, against that which was base and ignoble; he upheld with his voice, his talent and his means all things that tended to uplift and make better.

"Mr. Hill was a graduate of the Pottsville high school which has been dubbed 'the College of Mining Managers' because it is the only 'college' that the manager of nearly all the big anthracite coal companies ever knew. Of all the strong men this splendid institution has given to the world there is none that has reflected more credit upon it than Frank A. Hill."

Editorials

Colorado School of Mines To Honor Dr. Holmes

The editorial in *Coal Age* last week entitled "A Memorial for Dr. Holmes" has brought forth numerous suggestions indicating the high esteem in which Dr. Holmes was held by the mining fraternity. The following telegram is interesting and will meet with the warm approval of the friends of the late director of the United States Bureau of Mines:

> Referring to your editorial of July 31 concerning a memorial for Dr. Holmes, desire to say that the Board of Trustees of the Colorado State School of Mines will take action Aug. 12 on the establishment of the Joseph A. Holmes Professorship of Safety Engineering in honor of the man who did so much for the welfare of mining and metallurgical interests in this country. We feel here in Colorado that we could not provide a more fitting memorial to his memory. WILLIAM B. PHILLIPS, President Colorado State School of Mines.

Coal Age wishes to congratulate the School of Mines on this fine show of appreciation for the faithful and efficient labors of a loyal and respected man, who stood for the highest ideals in the science of mining.

⁂

A 40,000,000-Ton Annual Cut in British Exports

By far the most significant development in the export trade since the inception of the European War is the cable report just at hand to the effect that Great Britain has placed a rigid embargo against all exports, including those to her allies and excepting only British possessions and protectorates. In view of the turmoil prevailing in the coal fields of England, which has attained to more serious proportions than is perhaps generally known, this new regulation was not entirely unexpected by well-informed observers who have been closely following the trend of conditions.

Computed on the basis of the June exports for the current year, the order will mean the withdrawal of 3,561,650 tons of British coal per month from the world's markets. This figure may be assumed as a conservative estimate since the new conditions developed by the war may now be considered as fairly representative. During June Great Britain exported 3,725,423 tons. If we interpret correctly the meaning of this new regulation, the possessions which may still receive coal exports from England took only 163,773 tons during June. These include Gibraltar, Malta, Egypt, including Anglo-Egyptian Sudan and Aden with her dependencies. In normal times Egypt alone absorbs more than 200,000 tons per month of British coal, whereas this is now down to only about 65,000 tons, so that it will be seen this estimate takes into full account the present war conditions. Assuming this to be a typical month, this means a shortage in the foreign markets aggregating more than 42,000,000 tons per annum.

In the midst of all the excitement and flurry accompanying the reports of a tremendous expansion in our coal-export trade, it is well to remember that we have, on the contrary, suffered a sharp decline in our export shipments. It is true that there has been an unprecedented movement in new directions, as for instance to Italy, which has taken 1,250,000 tons during the past 11 months, as compared with practically nothing previous to this time. On the other hand, this gain has been more than wiped out by a decline of more than 3,000,000 tons, which we have lost in the bituminous exports to Canada during the past year.

Our gross exports for the 11 months ending May of the current year are 12,500,000 tons, as compared with 14,500,000 for the same period last year, showing a direct loss of 2,000,000 tons covering what is essentially the war period.

Turning again to the new regulations regarding the British exports, it is interesting to note that the tonnage she is withdrawing from the world's coal markets amounts to approximately three times our normal exports. In view of the fact that we are the only large producing country which can be drawn upon to make up this enormous deficiency, these figures are certainly significant. Lack of adequate shipping facilities and also probably insufficient loading capacity at our piers make it inconceivable that we would at any time in the immediate future be able to triple our exports, but there can be little doubt that we are now on the eve of a new era in the export trade.

⁂

To the Unsuccessful

This is written to the unsuccessful not because others will not be interested but because the fellow down on his luck will best understand it. It is certain it will not please him as much as it will others, but, then, nothing should be written merely to please. An attempt, at least, should be made to inform.

Some years ago you married, bought some furniture and began to raise a family. You had ambitions and hoped that after a few years of hard work, care, thrift and saving you would have a nice little bank account. But it didn't go that way. An insurance policy was taken out, but times got so bad you borrowed money on it, and year after year you had to pay interest on the loan, which had a way of increasing with frequency.

The furniture was new when you were married, but time has passed and the neighbors would not now take it even as a gift. The outlook is gloomy in the extreme. You had promised yourself to make each year pay for itself, yet every year since then seems to have been a clear debit; yet your income has not decreased. If anything, it is larger than it was. Now to add to your troubles there are more mouths to feed and you are getting old and beginning to fail as the years increase.

If all the people in the United States made a similar showing to yours—passed from year to year with their depreciations unreplaced, with their borrowings increased, where would the country end? And yet there are people, who are fair and honest in their dealings, who would like every dollar to go in wages and not a cent in profits or repairs, so much do they object to capital. They forget that the country is growing older and less fertile and less full of resources and is daily increasing its population. They forget its comforts must decline if for more people there is less substance.

Such people would bring Uncle Sam to the same unfortunate condition you are in. But if you could make a 50 per cent. saving and Uncle Sam could put 50 per cent. into profitable development, such as the Panama Canal, railroad lines, permanent roads and good houses for workingmen, and the other 50 per cent. into satisfying his immediate needs, how you and he could progress from comfort to comfort!

It is clear that profits are the hope of any nation, just as profits or savings are the sheet anchor of any individual. There is no doubt that there should be a big profit—that is, large savings. The only reasonable difference between economists is whether that profit should be private or public—that is, whether we should have private ownership or socialism. We cannot doubt but that the chisel of labor must be made effective with the hammer blows of capital; but just what form that hammer shall take is uncertain, even though we are sure that the chisel alone would be ineffective.

Asquith and Lloyd George have been urging the British people to save; but there is little hope that they will economize. For war times stir the mind and excited men spend like gamblers. There is no resource except in profits if Great Britain expects to lay aside $5,000,000,000 out of earnings. Perhaps it was because it remembered this that the government has been so loath to forbid large dividends. Only such a source of revenue as accumulated profits can prevent the country from becoming a debtor to nations that, being free of war, have money to lend. It is not likely that any appeal will make the British save, any more than such an admonition would make us thrifty in this country. Enforced temperance might accomplish something; but even that is doubtful.

It is a fact that a large percentage of British workmen now spend more than they receive as wages, for they are recipients of free education and of mothers' and old-age pensions partly provided by the state, which in Great Britain secures its funds mainly out of the profits of capital. It is also true, of course, that a large number have much money expended on them in dispensaries and relief organizations. If it were not for profits these pensions and assistances could not be provided. The men mentioned may not be larger consumers than producers of wealth, though many of them are, but it is only the profits of the manufacturer which prevent this being a fact. Even if these profits were divided among the producers, the small sum thus provided would be immediately spent.

The world will never grow, and it never has grown, except by dint of large profits. The problem to be met, and met soon, is how they may be distributed. Anyone who knows how the future is hampered by the policy of doing business on the meagerest of returns will realize that it is the nation's business to see that the investment both in capital and in labor is laying by a profit and amortizing its losses.

But it must be remembered that the economic problem of national advancement opposes, face to face, the question of moral health. Great wealth in the hands of individuals has corrupted many peoples and demoralized those who had it as well as those who had it not. It has been hard for the millionaire to be a man, and the attainment of real manliness is almost, if not equally, as hard for his employee, for the rich man tends to corrupt his poorer neighbor.

These remarks do not attempt finality. The problems at present seem to elude settlement, so the thoughts here expressed may be somewhat slangily ended with the colloquialism, "What's the answer?"

⁂

The Value of Safety First

The Madison Coal Corporation has had much success in its safety propaganda and in insuring its miners against injury. It has always carried its own insurance fund.

But there should be some hesitation in taking the success in safety propaganda and auto-insurance of A. J. Moorshead, president and general manager of the Madison Coal Corporation, as an example, for those who know Mr. Moorshead's ability in dealing with men will realize that his success might well be due to the man and not the methods. Two men do the same thing, follow an identical course and an extremely different result is obtained, for one man is magnetic and the other cold and dictatorial. One man leads and the other man seems merely to organize opposition.

But whether Mr. Moorshead or his methods are to be credited, he has been quite fortunate in reducing his accidents and settling his labor claims. It must be admitted that so far he has had no major accident. Still it is worthy of notice that in 13 years he has had 60 damage suits and has won them all, which shows that he has been disposed to settle every reasonable claim.

He has carried his liability for 0.6446c. per dollar of payroll and in addition to paying all expenses has accumulated out of that charge a liability insurance fund of $38,000. Deducting this surplus, the cost of accidents to the company has been only 0.4664c. per dollar of roll. The higher figure, 0.6446c. per dollar, is less than one-third of the best mutual rate and less than one-sixth of what a good stock company would demand.

We fear to offer for commendation a small feature of Mr. Moorshead's campaign because there is always the risk that someone will think it is alleged to be the main source of his freedom from accident, which would of course be absurd. Nor is the idea advanced as new. It has been used before in a slightly different form by the Susquehanna Coal Co. and perhaps others, and as far as can be discovered not without success.

The Madison Coal Corporation puts into the pay envelopes slips of paper of a different color each time with mottoes or warnings printed thereon. Such mottoes are: "Be sure the roof is in safe condition before commencing work." "Use care and avoid injuries." "Be careful all the time—and you won't be sorry afterward." "Someone's carelessness is the cause of every accident; don't be the one." "Better be safe and sure than crippled and poor." "Do not take chances; look—think—listen—before you act." "Where caution ceases danger begins." "The chance-taker is the accident-maker." "Is it safe? Be sure." And then finally an admonition of another sort, "Use as little powder as you can; it will save you money and give the company a better grade of coal."

It must be said that fortune does not unduly favor the Madison Coal Corporation. It operates the No. 6 seam in which statistics show that more fatalities per ton occur than in any other machine-mined bed in Illinois.

Victor-American Fuel Co.'s First-Aid Contest

By Tracy Garrett*

SYNOPSIS—The writer gives a careful criticism of the first-aid work of the various teams contesting for first place in the contest of the New Mexico division of the Victor-American Fuel Co. The Heaton team used cadgers of carbide to warm those who were suffering from shock.

First-aid teams representing the Heaton and the Weaver mines tied for first place in the annual first-aid contest of the New Mexico division of the Victor-American Fuel Co. held at the company's athletic park, Gibson, N. M., June 13. The handsome silver loving cup presented by the fuel company for these contests was finally awarded to the Heaton team. The Weaver first-aid corps, which has held the trophy since the last previous contest, gracefully relinquished its possession, but is determined to bring it back across the hills next year. The Navajo mine entered two teams, one from each opening. Navajo No. 2 finished third and Navajo No. 1 fourth.

This year's contest was pronounced by all the most successful that has been held. The interest in the rivalry was general, and the large amphitheater was well filled with spectators. The judging was done by Dr. A. H. Schermann, of the Diamond Coal Co., Allison, N. M., and James Yates and Tracy Garrett, division officials of the Victor-American Fuel Company.

At the conclusion of the contest the judges declared that the work of every team taking part was far above the average, the poorest being sufficient for all practical purposes, and that most of the deductions made against any team were for minor omissions, in the case of the Heaton team being for failure to complete one event within the specified time limit. Dr. Schermann, who had never before seen any of these teams work, remarked particularly upon the efficiency shown and the practical character of all the work.

HEATON TEAM, WHICH RECEIVED TROPHY AT THE ANNUAL FIRST-AID CONTEST OF THE NEW MEXICO DIVISION OF THE VICTOR-AMERICAN FUEL CO.

From left to right standing, J. E. Ambrose, superintendent; A. Browning, J. Jackson, J. Peckand, R. Dennard; kneeling, A. Jackson and R. Sneddon

For the contest, two rows of mine props were set 8 ft. apart, at 10-ft. intervals for a length of 125 ft. Strips were nailed from top to top of opposing posts, 6 ft. above the ground, and ropes were stretched along the sides, connecting the tops of the posts. These bounds were placed to simulate an entry in a mine. In one place props to represent a fall were piled half way up to the cross-strips mentioned, and at another a low place, 4 ft. high, was arranged. The fuel company's ambulance was also on the grounds, and each team furnished its own first-aid material, the judges passing upon what could legitimately be used as such.

CONTESTING TEAMS WITH THEIR PATIENTS SPLINTED FOR THE SUPPORT OF A BROKEN BACK

Carbide Cadgers for Heat in Case of Shock

The two teams representing Navajo and the Weaver team made use of safety lamps for applying heat in treating for shock, but the Heaton team used carbide cadgers, warming these by moistening the carbide which they contained.

Specifications for ten events were placed in envelopes, and the judges drew out five shortly before the contest started, so that no team or instructor would know in advance what events would be called.

The first event was the rescue of a man overcome by gas in a low place. He had become unconscious and must be dragged 10 ft. to a higher place and carried 50 ft. to good air. At that point artificial respiration was administered for one minute. The time allowed was 6 min. The Weaver and Navajo teams were each penalized in this event for failure to treat for shock before leaving the patient. Aside from this, the work in this event was particularly good.

Robert Dennard, captain of the Heaton team, besides using his safety lamp to test for inflammable gas before entering the place where the victim was lying, used a canary bird to test for carbon monoxide. It was the first time a bird had been introduced in a first-aid contest in this section, and while no extra credit was allowed for its use, it was an interesting feature and secured the applause of the spectators.

The second event was for full teams, and a simple fracture of the right thigh was treated. The victim was put on a stretcher, carried 50 ft., lifted over an obstacle and put into the ambulance. The time allowed was 10 min. The Heaton team took 11 min. and 20 sec. to complete the event and was accordingly penalized, but in every other way its work was of a high order. The Weaver team finished this event with a perfect score, coming well within the time limit, yet working deliberately, carefully and handling the patient in a most creditable manner. Navajo No. 1 was penalized for failure to sound the roof before taking the patient over the fall and because the captain did not handle the team properly.

The third event was the bandaging of a victim whose back was broken. The contestants improvised a stretcher and carried him 50 ft. All teams constructed their stretchers with the aid of jumpers, drills and bars. The time allowed was 10 min., and although the long back splints had to be assembled and padded, all teams came well within the time limit. The Navajo No. 1 team was penalized in this event for failure to do the most important thing first, a stretcher being made before the patient was treated and made as comfortable as possible. At the conclusion of the event and after the judges had carefully inspected the bandaging, they required each team to raise its patient to make sure that the splints were so securely bound that the man could not slip.

---

*Assistant general superintendent, Victor-American Fuel Co., Gibson, N. M.

The fourth event was the bandaging of simple fractures of the left humerus and right kneecap. The victim when treated was put on a stretcher. The time allowance was 8 min. All teams completed their work well within the limit and with excellent results. The chief deduction in this event was against Navajo No. 2 for putting the lower bandage too far from the injured kneecap.

The fifth event was the bandaging of a simple fracture of the right leg below the knee and a simple fracture of the lower jaw. After treatment the victim was put on a stretcher, the time allowance being 8 min. All the teams bandaged the head in a satisfactory manner, but Navajo No. 1 handled its stretcher with insufficient care.

Triangular Bandages Those Most Used

Under the rules either the triangular or roller bandage could be used, but the former was the more popular. In the last event, however, the Heaton team used a roller bandage in treating for simple fracture of the leg and did a particularly neat job although no additional credit could be allowed for it. The work of the Weaver team in applying triangular bandages to the patient's broken jaw occasioned favorable comment from the judges, as did the rapid and efficient work of Navajo No. 2. The work of Navajo No. 1 was rougher and not so well finished as that of the other teams, but in a practical test with underground conditions there is no doubt this team would show particularly well.

First-Aid Contest in Virginia

By G. B. Southward*

The First Annual First-Aid Field Contest of the southwest Virginia coal field was held at Big Stone Gap, Va., on July 2, 1915. The contest was under the auspices of the American Red Cross and the American Mine Safety Association and under the direction of Maj. R. U. Patterson, chief of the First-Aid Department of the American Red Cross, assisted by Dr. W. J. Shields of the same organization. In connection with the contest a mine explosion was demonstrated under the direction of E. B. Sutton, district engineer of the United States Bureau of Mines. The demonstration was given in a wooden gallery 85 ft. long, coal dust on shelves in the gallery being exploded by a cannon placed at one end.

LAUREL TEAM OF THE CLINCHFIELD COAL CORPORATION

Seventeen teams of white miners, representing the Clinchfield Coal Corporation, the Virginia Iron, Coal & Coke Co. and the Stonega Coke & Coal Co., were entered in the main contest. In addition to these, there were three colored teams of the Stonega Coke & Coal Co., who competed for a separate prize, and a boy-scout team of Stonega, Va., who gave an exhibition drill. The contest was witnessed by about 2000 spectators.

The contestants, headed by the Roda Band, marched onto the athletic field and took their stations in a continuous line

A DEMONSTRATION OF A COAL-DUST EXPLOSION IN THE WOOD GALLERY AT BIG STONE GAP, VA.

---

*Assistant engineer, Stonega Coke & Coal Co., Big Stone Gap, Va.

in front of the grand stand at 1: 30 p.m. About 20 min. was allowed for the teams to make their preliminary arrangements, during which time a test was made in the gallery, permissible powder being used in the cannon. No explosion of the dust resulted.

Five problems were given, including one-man, two-man and full-team events. Five-minute intervals were allowed between numbers; but the contest lasted a little less than one hour. Immediately following the last event a second explosion test was made, the cannon being charged this time with black powder instead of permissible powder. A severe explosion of the coal dust resulted, forming a cloud of smoke and flame at the end of the gallery which rose to a height of over 50 ft. After the explosion the scores were read and prizes valued at $300 were distributed by Major Patterson to the twelve teams having the highest scores in the full-team events. Ten prizes were given for the one-man and two-man events.

The winners of the first three prizes for full-team scores and the best teams in the one-man and two-man events were as follows:

First full-team prize: Won by the Laurel team of the Clinchfield Coal Corporation; consisting of the Westinghouse three-year silver loving cup, the Provident silver loving cup, American Red Cross medals and certificates, American Mine Safety Association medals and $40 in cash. Score, 93 per cent.

Second full-team prize: Won by the Inman team of the Virginia Iron Coal & Coke Co.; consisting of American Red Cross medals and certificates and $35 in cash. Score, 90.2 per cent.

Third full-team prize: Won by the Keokee team of the Stonega Coke & Coal Co.; consisting of American Red Cross medals and certificates and $25 in cash. Score, 90 per cent.

First prize one-man event: Won by J. J. Strong of the Imboden team of the Stonega Coke & Coal Co.; consisting of a gold watch and chain and American Red Cross medals and certificates. Score, 98 per cent.

First prize two-man event: Won by A. H. Hurd and Clarence Aldridge of the Keokee team of the Stonega Coke and Coal Co.; prize consisting of American Red Cross medals and certificates, a thermos carafe and an electric chafing dish. Score, 95 per cent.

Meeting of Superintendents of Utah Fuel Co.

At the June meeting of the superintendents of the Utah Fuel Co. held at Winter Quarters 18 men of various official capacities discussed the subject, "Standardization of Material and Methods."

Before supper the visitors were taken into the mine and shown some of the first-aid stations, situated conveniently to the centers of greatest activity. These stations are built of concrete, generally in cross-cuts, and all the walls and approaches are whitewashed. These offices are kept warm and dry by electricity. They are equipped with a complete assortment of first-aid appliances and supplied with water.

After supper all attended a meeting of the Winter Quarters' First-Aid Society, held in the auditorium of the newly erected amusement hall. The report of the society for 1914 mentioned that members had rendered first aid in a large proportion of the accidents which had occurred in and around the mine, had rendered financial aid to unfortunates in the community and had sent money for the relief of the European war victims, in all a most commendable showing.

At the superintendents' meeting it was decided that as the study of "Standardization of Material and Methods" as applied to coal mining embraced such a wide variety of subjects no one man could handle it fully. Consequently each man was asked to "ride his hobby" for the benefit of the others. From the variety of subjects introduced, those which held the most promise for immediate improvement were selected and discussed in detail at once. The others were considered as occasion permitted during the progress of the meeting.

SUGGESTIONS FOR STANDARDIZING MINE MATERIAL

To report all the remarks of the 18 persons present would take too much space, so only a few of the points made will be mentioned. The suggestion was presented that a central warehouse or store be provided which would be stocked with standard supplies. It was shown that these articles could then be bought in such large quantities as to effect a saving in cost. From this storehouse all the mines could draw. It was shown that between 30 and 50 per cent. could be saved on first cost by buying some materials in large quantities, and that by adopting standards the money invested in repair parts could be greatly reduced. Moreover, using standard articles caused an indirect saving, because camps, in case of accident, could be supplied from each other.

To descend to detail, by buying in quantity and standardizing the use of lubricating oils large savings were possible. By using good material of standard sizes much saving could be made in mine props and ties. Good props properly placed would hold the roof weight better, permit greater recovery of pillars, and a large percentage of the props could be recovered and used again.

Similarly, inferior ties, even though much cheaper in first cost, were in the long run poor economy, for they did not make good tracks, as the spikes driven in them did not hold well and derailments were many. The ties did not last long and could not be used again. It was also important to have the right weight of rails and standard shapes, so that certain sizes of fish plates, bolts and track bonds could be used throughout the mines.

While it was generally agreed that many materials could be purchased to conform to a standard, the standardization of machinery presented many difficulties. Machinery is bought as necessity requires, and sometimes long periods of time elapse between purchases. During this time many improvements may have been made in the apparatus required. Such improvements may not, however, justify the expense of new equipment throughout, yet it might be obvious that it would not pay to duplicate the old, which time had already rendered absolete.

BRINGING FOOD TO A STANDARD

The local doctor lent interest to the meeting by suggesting the need of standardizing foods, especially milk and meat. The need of a clean, wholesome milk supply is apparent to those who come in contact with the children of a camp. Good milk is difficult to obtain. The amount of freshly killed meat, especially goat meat, that is peddled around the camps is large and its bad effect on the health of some of the foreigners is marked. The doctor said these subjects were important economically because the efficiency of the workman depended largely on his receiving proper nourishment. A well-nourished man makes the most efficient laborer, while one who lacks such support often "hits the booze."

Methods are much harder to standardize than materials, and much study is needed before they can be standardized. It was the sense of the meeting that each division of the subject be made a special study by men who were versed in it and that their recommendations be made the base on which the future standards will be prepared.

Discussion by Readers

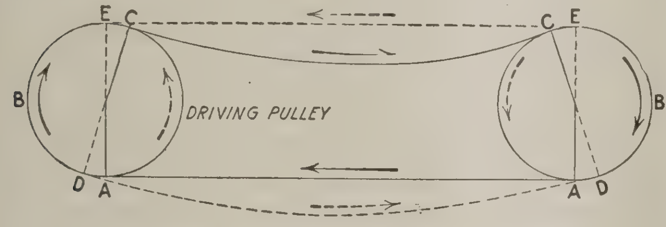
Mining Machinery--Belting

Letter No. 1—It has been suggested that much good can be derived from the discussion of the many practical points relating to mining machinery and equipment. One point that occurs to me, and which may prove interesting to others, is the adjustment, lacing and care of belts used for driving mine fans, pumps and other machinery.

Having spent much time in and about coal mines, I have observed that, as a rule, belts are not always used to the best advantage, and I offer the following suggestions that may be useful to the man who has belt trouble.

Except in the case of small belts driving light machinery, it is better to use a belt a little longer than necessary. In order to transmit the required power, the belt must exert a certain pressure on the pulley. In the use of a small belt this can only be obtained by stretching the belt tight. Such belts will generally be required to be tightened again, from time to time. A heavier belt, made somewhat longer than necessary, so that it operates with considerable slack, will give better results and require less attention than a tight belt.

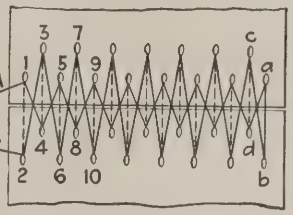
There is an advantage in running a belt as nearly horizontal as possible, and whenever practicable the direction of rotation of the driving pulley should be such that the pull will be exerted on the lower side of the belt. As shown by the full lines in the accompanying figure, when the pull is on the lower side the upper side of the belt, in sagging, increases the arc of contact on both pulleys and gives greater force to the belt by decreasing its tendency to slip on the pulley. On the other hand, if the pull is exerted on the upper side of the belt, the sag of the lower side will decrease the arc of contact to the same extent that it was increased by the previous arrangement, as shown by the dotted lines in the figure. In the former case, the arc of contact on both pulleys is *ABC*, while in the latter case it is only *DBE*. The arrows indicate the direction in which the belt runs in each case.



PROPER AND IMPROPER BELT-DRIVE

It is generally better to have the belt made up endless, especially for a high speed; otherwise, lacing will be necessary, and this must be properly executed. To lace a belt, two rows of holes must be punched in each end of the belt, these holes being staggered so as not to be opposite each other in any two adjacent rows. In order to reduce the tendency of the holes to tear out, an oval punch should be used. The edge of the first row of holes must not be closer than ¾ in. from the end of the belt, and the two rows of holes should be about 1 in. apart, center to center. Practically, the same distance must be preserved between the edges of the outer holes and the edges of the belt.

A good form of lacing is shown in Fig. 2. Starting at the left side of the belt, the lace *A* is entered the hole marked 1 from the upper side of the belt and carried underneath to the hole marked 2, as indicated by the dotted lines. It is then passed through hole 2 and carried on the upper side of the belt to the third hole, and thence on the under side to the fourth hole. In this manner the lacing is carried across the entire width of the belt. On arriving at the right side of the belt, the lace is passed through hole *a* and back through hole *b* twice, after which it is carried on the upper side of the belt to hole *c* and underneath to hole *d*. In the same manner the lacing is carried to the left side of the belt where the end *B* of the lace emerges from hole 2 on the upper side. The two ends *A* and *B* are then securely tied together on the upper side of the belt.



SHOWING GOOD METHOD OF LACING A BELT

There is thus formed on the under side of the belt a double lace passing from hole to hole in straight lines parallel to the length of the belt. There must be no crossing of the laces on the under side of the belt. The hair side of the belt should always be run next to the pulley, as being smoother it gives more perfect contact with the face of the pulley. No oil should be allowed to come in contact with rubber belting, but should there be any oil on the belt, it can be removed with turpentine. Only tallow or castor oil should be used on leather belting, and this but sparingly.

CHIEF ELECTRICIAN.

Logan, W. Va.

⁂

Stopping Payroll Leaks

Letter No. 6—In connection with the interesting letters on "Stopping Payroll Leaks," it occurs to me that many small pick mines, employing mule haulage and managed by competent mine foremen, will often put coal on the tipple much cheaper than some larger mines employing electric-haulage motors and cutting machines. There are no doubt several reasons for the higher cost of production at these larger mines; but I believe the most important factor in increasing the cost of operation is the upkeep of the electrical equipment of the mine, especially the bonding of the rails. Attention was drawn in Letter No. 3, May 22, p. 901, to a serious leakage of the electric current owing to the poor installation of the trolley-wire hangers inserted in the roof of the entry and causing a loss of hundreds of dollars a month.

I have been chief electrician and master mechanic for different coal companies for a long time, and in every instance but one the mine foreman had charge of the bonding of the rails on the main-haulage road. Among all these foremen I only recall one who realized or cared to realize the importance of good bonding. In some cases this work was entirely neglected with the idea of avoiding "unnecessary expense underground." The foreman, if he knew, entirely ignored the fact that this saving of expense underground was the direct cause of a much heavier expense in the power house, due to the burning out of armatures, field coils and controllers, for which the mine electrician would be responsible, in his opinion. It is needless to remark that under these conditions the company could have saved at least the electrician's salary, by giving the mine foreman charge of the entire equipment, since no expert knowledge is required to replace an injured part with a duplicate piece.

Only recently I accepted a position as chief electrician with a company operating several mines. Each mine was in charge of a mine boss, having a mine mechanic under him. Because of troubles in the electrical equipment, resulting in a high cost of production, the mine manager decided to employ a chief electrician, and I was selected for that place. Owing, however, to the fear of producing friction underground, the mine foreman still had charge of the rail bonding in the mine. It soon developed that the mine foreman of one of these mines was getting better results when he broke all past records by putting his coal on the tipple at a minimum cost.

It appeared, also, that the miners working in that mine were always satisfied and contented. They knew that when they reported for work in the morning they would not be sent home because of a breakdown of a haulage motor, cutting machine or other portion of the equipment. The foreman of this mine was a competent man, who always put the company's interest foremost and gave close attention to every mechanical detail underground, including the bonding of the rails.

In strong contrast with this favorable condition there was considerable trouble in the adjoining mines where the foremen did not give the same close attention to the smaller details of the mine equipment. The bonding of the rails was thought to be almost useless, and little effort was made to keep it in order. Starting from the mine entrance, one could find many joints too hot to bear the hand. In one case the foreman remarked that the bonding on the main road he thought was good, but he did not intend to give any attention to the bonding of headings where machines were cutting, as he thought it was unnecessary.

At another time a voltmeter gave a reading of only 180 volts on a 250-volt circuit, at a point 6000 ft. from the entrance to the mine. There were three gathering motors at work inby from this point, while a 10-ton motor was employed to haul the loaded trips to the tipple. When the motor on the main road started to haul its trip to the surface, the pressure would drop to 80 volts and remain so for five or eight minutes. During that time the small gathering motors could not move.

In this mine the trolley wire on the gathering haul was in such bad shape that the mortormen did not attempt to use the trolley poles, preferring to operate their motors with the cable from the gathering reel. Since there were in all ten gathering motors in this mine doing the same thing, it can well be imagined that this was an expensive proposition for the company, resulting frequently in the burning out of armatures and controllers and causing other troubles. The cutting machines had to work with such low voltage that it took but a short time to burn out the fuses and armatures on those machines, making the expense for maintenance shamefully high and causing much unpleasantness for all concerned.

In my opinion, with proper bonding alone in this mine, the cost of putting the coal on the tipple would have been 10 or 11c. per car less, or about 4c. per ton less than under the prevailing conditions. Assuming the mine ran only 20 days in the month, this would mean a saving of $800 a month.

The trouble to which I have referred is a common one, and the instances cited show the saving that could be effected by employing a competent electrician and giving him charge of the entire electrical equipment, both on the surface and underground. It is manifestly unfair to hold an electrician responsible for results that are due to another man's neglect. It does not appear to me that there is any cause for friction when the bonding of the rails is in charge of a competent electrician, instead of being left to the mine foreman to look after, who is not particularly concerned in the trouble his neglect causes in the power house, and elsewhere, for which he will not be directly to blame, according to his reasoning.

Successful operation demands that all mine work be classified and a competent man be placed in charge of each kind of work for which he is particularly fitted, and made responsible. To obtain competent men, I believe examinations should be held, covering each class of work, and certificates of competency given to candidates who pass a successful examination.

Success in First-Aid Work

In passing judgement on events that have taken place, different individuals arrive at different conclusions because they view the events from different standpoints or angles. I was impressed with this fact when reading accounts of the recent field meet held at Birmingham, May 29, under the auspieces of the Alabama Safety Association and other similar organizations, both local and national.

According to the officials, this was the most successful first-aid meet ever held in this country. On the other hand, I have heard a great many criticise the work that was done and the manner in which it was judged by those appointed to pass on the merits of the different teams taking part in the contest. I notice that a brief comment in *Coal Age,* June 19, p. 1065, offered the same criticism of some of the judges. My observations at the time inclines me to the belief that these criticisms were not nearly severe enough.

I do not like to think that these organizations, formed for the benefit of the hard-working classes, comprise among their officers an exclusive aristocracy. It is to be hoped that this is not the case, for the sake of the future success of the first-aid movement.

Before giving the results of my observation on the field I want to ask, What constitutes a successful meet? Is it the number of teams contesting, or is it the quality and proficiency of the work they perform? Numbers undoubtedly lend enthusiasm to a movement, but few will deny that the quality of the work done by the teams, and its manner of execution, are the factors that truly measure the success of the undertaking. Then, again, is it fair for those who have prepared themselves to enter such a contest to have their work judged by men whose knowledge of the requirements of the contest and the aims sought to be attained is doubtful?

For the good that it may do, I want to state briefly how this meet appealed to me and to a great many others who were present though not participating in the event. It will be readily agreed that the rules drawn up to govern the contest should be rigidly enforced. The judges should be familiar with these rules and should base their judgement on the manner in which the different teams conform to the regulations. In this connection, I will cite a single instance.

I noticed that many of the negroes who had entered the contest were working with their bandages, splints, etc., all ready prepared, and that some of the white teams were doing the same thing. Believing that the best interests of the first-aid work should be carefully watched, I reported my observations to the chairman of the meet. He did not seem too well pleased, and replied, "We can't look into all the details." I have always thought that the details of first-aid work were what counted. But the tone and manner of the chairman told me that further suggestions were not acceptable. I found, a little later, that many of the judges were giving credits for work performed by the teams that, in truth, should have been penalized.

I want to suggest further that the spectators, in this case, were kept at too great a distance to observe closely how the work was done and benefit thereby. One of the objects of the meet should be the education of the onlookers. We should not forget, also, that the children of today are the men and women of tomorrow; and these should be invited and permitted to see how the work is performed. If we are in earnest in securing the best results of this movement, we must remember that the greatest success can only be attained when everyone in an industrial community is in harmony with the objects sought and the manner of their accomplishment.

⁂

Preventing Mine Explosions

Letter No. 4—I say, with Mr. Rose, *Coal Age*, May 8, p. 819, that in all mines wherein explosive gas is given off in sufficient quantities to warrant its being designated as "gaseous," there will continue to be explosions until certain practices that now exist are eliminated. According to methods based on practical principles, a mine is pronounced "in safe condition when free from gas."

This report is the result of a recent examination in which no explosive mixture was detected at any point in the mine. Nevertheless, the air current in this mine may be quickly converted from a so-called "safe condition," to a highly dangerous condition as the result of many common causes, such as a sudden decrease in the supply of fresh air, owing it may be to a door or regulator being left open or changed, or to an increase in the amount of gas owing to fresh feeders being tapped.

Now, with the present standard of efficiency in the ventilation of mines required by the laws of Pennsylvania, and mine-foremen and firebosses discharging their respective duties faithfully and using no other light than an approved safety lamp in examining the mine, and all shots being fired by competent shotfirers, after the men have left the mine, and compressed air being used as a substitute for electricity, the liability to gas explosions will be reduced to a minimum. The objections made to these suggestions will no doubt be many and come from operators and miners having only their own personal gain in view, but it must be admitted by all fair-minded thinkers that their general adoption would add to the safety and welfare of all concerned.

Robt. Brown.

Bolivar, Penn.

⁂

Mining Laws and Legislation

Letter No. 7—I have been much interested in the letters relating to the legal responsibility of the assistant mine foreman under the Pennsylvania mine law. Reference has been made to the suit instituted a short time ago by a district mine inspector against Assistant Mine Foreman Joseph Willis, charging him with neglect of duty in failing to see that suitable timbers were set in a room where a miner was killed while at work, by a fall of slate. It developed that the assistant foreman had instructed the miner to set the necessary props as he had some bad roof in his room. The miner neglected to do as he had been instructed, with the result that he was crushed to death by the fall that took place shortly after these instructions were given.

The question in my mind is, Can this assistant foreman be held responsible for the neglect of the miner, after having given him instructions to make his place safe? The Pennsylvania bituminous law (1911), art. 25, rule 1, states as follows:

> The miner shall examine his working place before beginning work and take down all dangerous slate, or otherwise make it safe by properly timbering it, before commencing to mine or load coal. . . . The miner shall at all times be careful to keep his working place in a safe condition during working hours.
>
> Should he at any time find his place becoming dangerous, . . . he shall at once cease working and inform the mine foreman or the assistant mine foreman of said danger, etc. . . . He shall order all props, cap pieces, and other timbers necessary, at least one day in advance of needing them. . . . If he fails to receive said timbers and finds his place unsafe, he shall vacate it until the necessary timbers are supplied.

These rules and regulations are, or should be, posted at every mine, printed in different languages, so that each miner can read them and know that he has duties to perform, the same as the mine foreman and his assistant.

If the miner, therefore, neglects to do his duty after receiving instructions from his foreman or an assistant, he is responsible for any accident that may result from such neglect. As I said before, I fail to see how a mine foreman or his assistant can be held responsible for the miner's neglect, after he has performed his duty by instructing the miner to make his place safe.

The mine inspector is often prone to require more of the mine foreman and his assistant than can be naturally expected of these officials. Too often the entire responsibility for an accident is laid on the shoulders of the mine foreman or his assistant, the mine inspector claiming that the mine foreman should see that his instructions are carried out. I would ask, Does the mine inspector himself follow the same rule? He calls the mine foreman's attention to a violation of the law, or unsafe condition, and takes it for granted that the matter will be remedied before his next visit. Could it be expected that he would remain at the mine to see that his orders are carried out promptly? It would be just as unwise to expect the mine foreman or assistant foreman to remain in a single place to see that his instructions are promptly obeyed.

If the foreman or his assistant is to be held responsible for accidents resulting from the neglect of workmen to obey his instructions, it follows that the mine inspector should likewise be held responsible for accidents resulting from the neglect of mine officials to comply with his orders. If a foreman or his assistant were compelled to stay and see that his instructions were obeyed, he could not complete his rounds; but the law places this responsibility on the miner, who must obey the instructions given him, as required in art. 4, sec. 9, which reads as follows:

> . . . Any workman who neglects to carry out, or disobeys the instructions of the mine foreman or his assistant, in regard to securing his working place, shall be suspended or discharged by the mine foreman, and if such negligence or disobedience results in serious injury or loss of life to any person, the mine foreman shall give the name of said workman to the inspector for prosecution in accordance with sec. 2, art. 26, of this act.

Art. 26, sec. 2, reads as follows:

> Any person who neglects or refuses to perform the duties required of him by this act, or who violates any of the provisions or requirements thereof, shall be deemed guilty of a misdemeanor and shall, upon conviction thereof, in the Court of Quarter Sessions of the county in which the misdemeanor was committed, be punished by a fine not exceeding $200, or imprisonment in the county jail for a period not exceeding three months, or both, at the discretion of the court.

I would ask, If a miner is held legally responsibile for the death of another person resulting from his own neglect, why should he not be responsible for his own death resulting from such neglect?

I am a firm believer in a uniform system of timbering. I believe each miner should be instructed by his foreman or assistant in regard to the system of timbering adopted in the mine. If a miner fails to carry out these instructions, he should be suspended or discharged; and, in case of accident resulting from such neglect, he should be prosecuted, as required by law. If this were done, more heed would be given by the miners to their instructions, and there would be fewer accidents at the working face. I hope to hear from other mine foremen and assistants along the same line.

OLIVER YOUNG, Assistant Mine Foreman,
Cowanshannock Coal & Coke Co.

Nu Mine, Penn.

Study Course in Coal Mining

By J. T. BEARD

The Coal Age Pocket Book

Method of Calculation—The calculation of the heat of combustion from the heats of combination of the combustible and the several products formed, will be best understood by a practical illustration following the statement of a few fundamental principles that always govern the operation. Briefly stated these are as follows:

1. No heat energy is lost, but the heat of an element, in any reaction, is zero, there being neither combination nor dissociation possible in the element as in a compound.

2. Total heat of formation of products is the **positive (+) heat** developed in the reaction.

3. Heat of decomposition (same as heat of formation) of the combustible is the **negative (—) heat** or the heat absorbed in the reaction.

4. The heat of combustion is the **net heat**, or the difference between the total heat in the products and the heat in the combustible.

5. The reaction generates heat, or is **exothermic,** when there is an excess of positive (+) heat.

6. The reaction absorbs heat, or is **endothermic,** when there is an excess of negative (—) heat.

Note—The **chemical equation** expressing a reaction shows the equivalence of weight of matter before and after reaction, but does not show the thermal effect.

A **thermochemical equation** is written by adding to the chemical equation a positive or a negative term indicating the heat generated or absorbed in the reaction. This heat may be expressed as "gram-calories," "kilogram-calories," or "pound-calories," according as the weight of the combustible taken is a gram-molecule, a kilogram-molecule or a pound-molecule. Or, the heat of the reaction may be given as B.t.u. per pound, or other denomination. The weight-unit is immaterial, since the **heat of the reaction** is always that due to the molecular weight of the combustible expressed in the same weight-unit.

The amount of heat corresponding to the molecular weight of the combustible (expressed in any weight-unit) is frequently called the **"molecular heat"** of the reaction.

The molecular heat of a chemical reaction, divided by the molecular weight of the substance consumed, gives the heat of the reaction per unit weight of substance, which is the heat of the combustion expressed in the same denomination as the weight of the substance.

Illustration—The heat of combustion of methane (CH_4), as determined by Favre and Silbermann (See Table), is 23,513 B.t.u. per lb.; or $23{,}513 \times {}^5/_9 = 13{,}063$ lb.-cal. per lb.; or 13,063 kg.-cal. per kg., or grm.-cal. per grm. of the gas.

The molecular heat of this reaction is therefore

$$16 \times 23{,}513 = 376{,}208 \text{ B.t.u.}$$

or

$$16 \times 13{,}063 = 209{,}008 \text{ cal.}$$

It is observed, thus, that the molecular heat, in the combustion of methane, is the heat (B.t.u.) generated by 16 lb. of the gas; or the heat (lb.-cal.) generated by the 16 lb.; or the heat (kg.-cal.) due to 16 kg.; or the heat (grm.-cal.) due to 16 grm. of this gas. Different authorities have obtained slightly varying heat values of the gases.

The Coal Age Pocket Book

Writing a Thermochemical Equation—The thermochemical equation expressing the reaction that takes place and the heat that is generated in the combustion of methane (CH_4) is written thus:

$$CH_4 + 2\ O_2 = CO_2 + 2\ H_2O - 388{,}100 \text{ B.t.u.}$$

Or, in the French system,

$$CH_4 + 2\ O_2 = CO_2 + 2\ H_2O - 215{,}600 \text{ cal.}$$

The reaction is exothermic, or generates heat, which is the excess of the heats of formation of the products of the combustion (carbon dioxide and water), over the heat of formation of the combustible (methane).

Likewise, for the combustion of carbon to carbon dioxide, which generates 14,550 B.t.u. per lb., or $14{,}550 \times {}^5/_9 = 8083$ cal., the molecular heat of the reaction is $12 \times 14{,}550 = 174{,}600$ B.t.u., or $12 \times 8083 =$ say 97,000 cal. The thermochemical equation expressing this combustion is

$$C + O_2 = CO_2 - 174{,}600 \text{ B.t.u.}$$

or

$$C + O_2 = CO_2 - 97{,}000 \text{ cal.}$$

In these equations, the heat of combustion is equal to the heat of formation of the product (carbon dioxide), the heats of the elements (carbon and oxygen) being zero.

Heats of Formation of Substances—The heats of formation of a few substances that are of interest in mining are given in the following table. The heats are given as molecular heats for convenience of substitution in equations.

TABLE OF HEATS OF FORMATION OF SUBSTANCES

		Molecular Heats of Formation	
Substance	Symbol	B.t.u.	Cal.
Methane	CH_4	39,060	21,700
Acetylene	C_2H_2	98,550	54,750
Ethene (olefiant gas)	C_2H_4	—20,250	—11,250
Ethane	C_2H_6	47,970	26,650
Carbon monoxide	CO	52,200	29,000
Carbon dioxide	CO_2	174,600	97,000
Hydrogen sulphide	H_2S	8,640	4,800
Sulphur dioxide	SO_2	124,668	69,260
Ice (32° F.)	H_2O	128,880	71,600
Water (32° F.)	H_2O	126,288	70,160
Water (212° F.)	H_2O	123,048	68,360
Steam (212° F.)	H_2O	105,660	58,700

For the most part, the heat values in the above table have been determined by experiment, by means of the calorimeter. The values of the heats of combustion, as calculated from these molecular heats of formation, by substitution in the chemical equation expressing the reaction, will not be found to check the earlier determinations of Favre and Silbermann; but the variation is slight.

For example, writing the thermochemical equation for the combustion of methane, indicating the required heat of combustion by x, we have

$$\begin{aligned} CH_4 + 2\ O_2 &= CO_2 + 2\ H_2O - x \\ 39{,}060 + 0 &= 174{,}600 + 2(126{,}288) - x \\ x &= 174{,}600 + 2(126{,}288) - 39{,}060 = 388{,}116 \text{ B.t.u.} \end{aligned}$$

Then, the molecular weight of methane being 16, the unit heat of combustion is $388{,}116 \div 16 = 24{,}257$, instead of 23,513 B.t.u

Inquiries of General Interest

A Dangerous Condition

We have recently been facing what some have advised was a dangerous condition in one of our mines. The seam is 12 ft. in thickness, and has an inclination of 21 deg. The coal is bituminous, low in volatile matter, and fairly hard. There is more or less fireclay in the bottom, while the top is hard and does not break readily.

At the present time the mine has been developed to its full extent and work in the lower part of the mine has been abandoned. The work of drawing the pillars in the upper portion has been progressing, until we have reached a point where it has seemed doubtful whether this work can be continued much farther with safety.

There is naturally an inclination on our part to go as far as it would be considered safe, and perhaps even to take chances that may seem unwarranted to an unprejudiced mind.

Now, I would like to ask, Are there not some readers of *Coal Age* who have had just such experience in the working of a thick seam of coal on a considerable inclination under a hard roof that would not break? If there are any such I would very much appreciate learning of their experience, and receiving from them suggestions of what in their best judgment is the safest method to pursue, or whether it would be dangerous or assuming an unwarranted risk to continue to draw the pillars in the upper portion of the mine.

The mine to which I refer has been opened by a slope driven on the full dip of the seam and having a total length of practically 5000 ft. This main slope is used as a haulage road, and is flanked on either side with a pair of entries, which are used for ventilation, drainage and manways. These main-slope headings thus consist of five parallel entries. Cross-headings or levels are driven to the right and left of these slope entries, every 100 yd. on the strike of the seam, and rooms turned to the rise off these levels.

The surface being generally level, the depth of cover at the foot of the slope was practically from 500 to 600 yd. It would seem that there should be some practical method that could be adopted for the more or less complete extraction of the coal left in the pillars.

General Superintendent.

———, Alberta, Canada.

The above inquiry presents a practical question of great interest in coal mining. The conditions described duplicate to a considerable extent those recently discussed in *Coal Age* in reference to the Pittsburgh seam, known as the No. 8 seam in Ohio. The discussion in that case referred to the question as to whether that seam could be worked successfully by the longwall method of mining. The case considered in the above inquiry, however, refers to a fully developed mine, in which the work of drawing back the pillars is in progress, with the result that no satisfactory break of the roof has been secured, and the question of the safe continuance of the work is in considerable doubt. Let the readers of *Coal Age,* many of whom have had experience under similar circumstances, say what, in their judgment, is best or safe.

⁂

Variation in Line Drop

Kindly answer in *Coal Age* the following question which has puzzled me:

If the drop on a given section of road where electric haulage is employed is 50 volts when the load is uniformly distributed, what will it be if the whole load is concentrated at the end of the line? Explain fully.

Electrician.

Linton, Ind.

In answer to this question it may be stated that a uniformly distributed load in electric haulage is equivalent, in respect to the total resistance or line drop, to the same load concentrated at the center of the line. Also, the line drop is always proportional to the resistance of the line, and this resistance is proportional to the distance of the load from the power station. Hence, a load at the end of the line will cause a line drop of twice that due to the same load at the half-way point.

Therefore it may be said that if the line drop is 50 volts when the load is uniformly distributed, the drop will be double this amount, or 100 volts, when the same load is concentrated at the end of the line.

This answer, of course, is only approximately true, since there are numerous causes in electric haulage that operate to modify both the resistance and the consequent line drop. Such modifications, however, would have to be considered in detail, involving data not given.

⁂

A Question on Heat

How much heat will be required to convert 10 lb. of ice, at a temperature of 18 deg. F., into steam, at an absolute pressure of 30 lb. per sq.in.?

Joseph J. Dorotinsky.

Waltersburg, Penn.

The specific heat of ice being 0.504, the heat absorbed for a rise of temperature from 18 deg. to 32 deg. F. is 0.504 (32 — 18) = say 7 B.t.u. per lb. To this must be added the latent heat of ice, or the heat absorbed in melting (144 B.t.u. per lb.), which gives for the total heat absorbed when the ice has melted 7 + 144 = 151 B.t.u. per lb. The total heat above 32 deg. F., in steam at 30 lb. absolute pressure, as taken from steam tables (Marks and Davis), is 1164 B.t.u. per lb., which makes the total heat required to convert 10 lb. of ice, at 18 deg. F., into steam at 30 lb. absolute pressure,

$$10\ (151 + 1164) = 13{,}150\ B.t.u.$$

Or, since latent heat of steam is 966 B.t.u., specific heat 0.48, and temperature at 30 lb. pressure, 250 deg F., the same result is obtained thus: $10[151 + (212 - 32) + 966 + 0.48\ (250 - 212)\ ] = 13{,}150\ B.t.u.$

Examination Questions

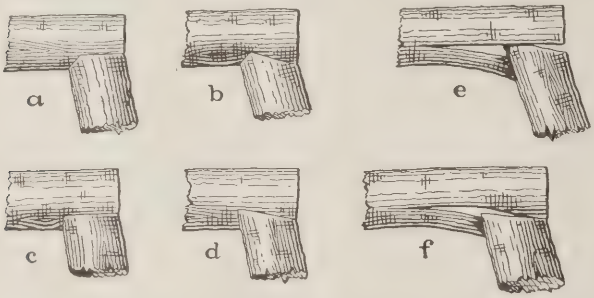
Alberta (Canada) Examination, June 15-17, 1915

(*Selected Questions*)

Ques.—When is it necessary to notch timber? Sketch and describe the correct and incorrect methods of making two notches with which you are acquainted. Show by sketches the effect of improper notching on the life of mine timber.

Ans.—All timbers forming a part of a timber frame should be notched.

In the accompanying figure are shown two methods (*a* and *b*) in quite common use for notching mine timbers when timbering airways and haulage roads. The method shown at *a* presents a horizontal bearing surface for the top of the leg, while that at *b* is inclined. In both of these methods, the notch is cut at an angle with the axis of the collar, which is correct. The method shown at *a*, however, is preferable as the bearing surface is there at right angles to the direction of the roof pressure.



PROPER AND IMPROPER METHODS OF NOTCHING MINE TIMBERS

At *c* and *d* are shown the incorrect methods of making the two notches just described. The notch at *c* is cut at right angles to the axis of the collar instead of being cut at an angle, as shown at *a*. The notch at *d* is cut forward in the collar so that it is nearly parallel to the axis of the leg. Both of these methods present more or less of a tendency to split the collar, as shown at *e* and *f*.

Ques.—What is the total pressure at the bottom of a pipe full of water, 10 in. in diameter and 600 ft. high?

Ans.—The pressure due to a head of water of 600 ft. is $600 \times 0.434 = 260.4$ lb. per sq.in. The total pressure exerted on the sectional area at the bottom of a 10-in. pipe is therefore $260.4 (0.7854 \times 10^2) = 20{,}451.8$ lb., or nearly $10\frac{1}{4}$ tons.

Ques.—Describe the danger that attends the use of electricity in and about coal mines and the safeguards necessary.

Ans.—The principal dangers from the installation of electricity in coal mines are contact of men or animals with live wires and ignition of gas or combustible material by the sparking of wires, short-circuiting of the current, burning out of fuses, etc. To avoid the danger of contact, all live wires should be properly safeguarded by a suitable installation of the wires or by the necessary protection of the trolley wire at all points where men or animals are liable to come into contact with the same. Men or animals should not be allowed to travel on entries or haulage roads where trolley or other live wires are installed. All electric installations should be made by a competent electrician, and switchboards and other electrical appliances should be in charge of competent men and inspected daily.

Ques.—Define the terms "force," "work," "foot-pounds" and "horsepower."

Ans.—The term "force" describes any agency that produces or tends to produce any change in the condition or state of matter, whether physical, mechanical, electrical, chemical or magnetic.

The term "work," in mechanics, describes the result of a force acting through a certain distance. The work performed is measured by the product of these two factors.

The term "foot-pounds" expresses the measure of a given work, as being the product of the distance, in feet, and the force exerted, in pounds.

The term "horsepower" is the mechanical unit of power in common use and is equal to 33,000 ft.-lb. per min. It expresses the work performed in a unit of time and assumes that the average work of a horse is 33,000 ft.-lb. per min.

Ques.—Describe how you would examine a steel wire hoisting or haulage rope, and mention where defects are most likely to be found. How would you protect the rope in a wet shaft or slope?

Ans.—A wire hoisting or haulage rope must be carefully examined at regular short intervals for any broken or defective strands that are badly worn and liable to break. A common practice is to allow the rope to pass slowly through a bunch of oily waste held in the hand. This, however, will only detect strands that are broken and protruding from the rope. All hoisting ropes especially should be more carefully examined, to ascertain the amount of the wear of the outer strands. All ropes used on haulage slopes should be examined in the same manner. Special attention should be given to that part of the rope within a few feet of the end couplings, which is more liable to be injured by the kinking of the rope when slack is given. Also, that portion of the rope resting on top of the head-sheave and exposed to the weather when the cage is at the shaft bottom or at the upper landing should be carefully examined. This portion of the rope is also subject to greater strain, owing to the additional bending stress at the moment the load is being started from the bottom of the shaft.

To protect a rope in a wet shaft or slope, it should be treated with an application of tar, boiled oil or other dope that will penetrate the rope and protect the strands from the corrosive action of the mine water. Such application should be made as the conditions require.

Coal and Coke News

Washington, D. C.

Figures prepared by the Department of Commerce for May and the 11 months ending with May and showing exports of coal from the United States for the periods in question have just been issued. These show the following results:

Countries to Which Exported	May				Eleven Months Ending May					
	1914		1915		1913		1914		1915	
	Tons	Value	Tons	Value	Tons	Value	Tons	Value	Tons	Value

The showing indicates unexpected improvement in May as compared with conditions previously existing during this fiscal year; and on the strength of this some people are again predicting large development of the export trade in coal.

The following study of the bunker coal situation at the Panama Canal has been issued by the Isthmian canal commission which calls attention to the requirement of additional equipment to meet needs prior to the completion of permanent plants.

The difficulties of coaling vessels promptly at Cristobal, which have been experienced as the result of the increasing demands of vessels and the noncompletion of the permanent coaling plants, have been lessened by the use, in addition to the previous facilities, of four motor-driven conveyors, or hoisters, which are used to discharge coal from barges and lighters alongside vessels into their bunkers. Two 500-ton barges have been fitted for this service, each with two conveyors. The conveyors are of the Demayo make and consist essentially of an endless chain of scoops, operating in a vertical steel casing about 25 ft. high, from the top of which the material being handled is discharged into a pipe chute, passing by gravity to its destination. The elevators are suspended by cables from booms. This regulates their elevation while they dig into the coal and allows their being swung about to reach any point in the hold of the barge.

The first use of this new equipment on commercial vessels was in the coaling of the steamship "Finland" of the Panama Pacific Line, which passed through the Canal on her way from New York to San Francisco on June 24. On the second vessel coaled, the "Guatemala" of the Pacific Steam Navigation Co., the rate of supply was 26½ tons per hour. This is regarded as low for this equipment, and it is expected that when the operators shall have become thoroughly trained to their work each barge will supply approximately 60 tons per hour. If such effectiveness be attained the facilities for bunkering at Cristobal will have been practically quadrupled.

In the mean time, work is being pushed on the permanent coaling plant for the Atlantic entrance as rapidly as the material is supplied by the contractors. It is planned to complete two of the four unloader towers in September, and, by a modification of their construction, use them for both unloading colliers and loading into customer vessels from the stock pile. This is a temporary expedient, for use only until the regular reloader towers shall be completed, but as the two towers command a considerable storage space and each will be capable of handling about 250 tons an hour, it will in all probability meet the situation quite satisfactorily until the completed plant is in service.

All four of the towers for the plant have been erected, but the two toward the outer end of the wharf are those on which early completion is being pushed. The two stocking and reclaiming bridges have been practically completed with respect to the structural work, but the machinery is yet to be installed. They will probably be completed by the end of September. The material for the reloader towers has begun to arrive from the United States and their erection will begin shortly. The viaduct commanding the dry storage space is about 50 per cent. completed. The dredging alongside the wharves has advanced sufficiently to allow vessels access to the plant whenever desired.

At the Pacific plant, one of the two unloader towers is practically erected, and all four of the berm cranes, which will be used for stocking and reclaiming, have been erected. Work has not begun on the two reloaders, the wharf for which is yet to be built; the sinking of caissons for this wharf is in progress. This construction is intimately related to that of the drydock, as the coaling plant will form one side of the entrance slip to the dry dock, and the work is held back somewhat by the need of the dry dock construction.

HARRISBURG, PENN.

The Public Service Commission has held in the case of the Pittsburgh Plate Glass Co. against the Pennsylvania R.R. Co., that the collection of demurrage on the shipments complained of was not provided for by the tariffs of the respondent in force at the time of the complaint.

The Pittsburgh Glass Co. complained that the Pennsylvania R.R. Co. was charging and collecting from it demurrage upon loaded coal cars belonging to the glass company, transported by the railroad company from the mines of the glass company, and placed upon the private siding of said glass company, at its factory, at West Tarentum.

The complainant is the owner of a plate glass factory. It owns also a coal mine ¾ mile away, from which it ships the coal needed in the factory, on the line of the respondent railroad. It owns also a number of steel hopper cars in which the coal is shipped and which are used exclusively for this purpose. The railroad company charges the regular tariff rates for the transportation, making allowance to the glass company of 0.6c. per mile for each car. The railroad company charged a demurrage for these cars at the rate of $1 per car per day while these cars, after delivery, stand loaded upon the tracks of the complainant constructed by it upon its own property. It is the charge of demurrage to which the glass company objected. The general rules respecting demurrage, which have met the approval of the Interstate Commerce Commission, provide as follows: "Private cars while in railroad service, whether on railroad company or private tracks, are subject to these demurrage rules, to the same extent as cars of railroad ownership. Empty private cars are in railroad service from the time they are placed by the railroad company for loading or tendered for loading on the orders of the shipper. Private cars under lading are in railroad service until the lading is removed and cars are regularly released."

The Commission decided that this was a case which ought to be decided upon its own facts, and these facts distinguish it from most, if not all others which have been heretofore determined. It was contended for the railroad company first, that the case of the glass company is within the language of the above cited rule; second, that certain authorities which were cited have determined the question here raised upon principal in favor of the railroad company.

The commissioners decided that the facts presented did not show the cars were in the service of the carrier. They could not be used by the carrier for any other purpose than the service of the complainant. At the time the demurrage was attempted to be imposed, these cars had been delivered to the complainant and were its own cars, filled with its own commodities (coal) upon its own tracks. The railroad company denied any liability for the cars or lading after delivery upon the owner's siding. Under these circumstances the Commission holds that the enforcement of demurrage seems entirely to fail. Its enforcement could not compel the prompt return of the cars. The railroad company had no right of any kind to the cars, their use or possession. The glass company after unloading might retain the cars and never return them. No right to possession upon the part of the railroad could in any way be maintained. The argument that the carrier ought to be enabled to know upon how many private cars it may depend in order that it may secure sufficient other cars for its service, is not sustained by the Commission, because these cars could never have been depended upon for such service and the railroad company could not have been misled.

The Commission held that the language of the general demurrage rule does not specifically refer to the case of the delivery of cars to their owner upon his own tracks, and ordered the railroad company to cease and desist from charging and collecting from the glass company demurrage upon the loaded coal cars of the glass company transported by the Pennsylvania R.R. Co. from the mines of the glass company and placed upon the private siding of the glass company at its glass factories.

PENNSYLVANIA

Anthracite

Shenandoah—Two miners, Thomas Murt and Michael Laura, were recently entombed in the Knickerbocker colliery of the Philadelphia & Reading Coal & Iron Co. from seven o'clock in the evening until one o'clock the next morning. The accident was due to a fall of top coal covering a distance of 100 ft. Officials of the company arrived on the scene promptly and immediately instituted extensive measures for rescue. These were exceedingly dangerous, on account of the continuous falls of coal. Due to the zealous efforts of the rescuers instead of the work taking a day or more as expected, the men were reached in six hours. They were unhurt and on account of being on a night shift had no knowledge of their peril until they heard the work of the rescue party.

Sunbury—There is considerable agitation among the companies and individuals engaged in dredging coal from the Susquehanna and other rivers of the coal region as to whether they come within the provisions of the anthracite tax act of 1915. It is the opinion of some that the river dredgers are covered by that portion of the act relating to washeries, whose product was not taxed under the old law. There is no doubt that the Attorney General will soon be called upon to render an opinion covering the disputed point.

Gilberton—One thousand employees of the William Penn colliery struck on July 31 because two workmen refused to wear new union buttons and pay up arrears. This compelled the colliery to suspend operations.

Nesquehoning—Two miners, Leo Sparish and John Domita, employed by the Lehigh Coal & Navigation Co., were overcome by black damp in the company's tunnel recently. After prolonged and difficult efforts to induce respiration they were revived and are expected to recover.

Plymouth—The Delaware & Hudson Co. has issued orders that its No. 2 colliery will work double time or two 9-hr. shifts daily. This is done to make up for lost time at No. 5 colliery of the same company. Work was suspended at No. 5 some time ago in order to make alterations to the breaker whereby the coal run through may be washed. Coal from Nos. 4 and 5 mines, also the Boston coal goes through No. 5 when in full operation, but the coal from Boston and No. 14 can be run through No. 2, hence the mines will go on double time. Night shifts in this locality will be a novelty to the miners, particularly at this time when other companies are running slack. The Delaware & Hudson Co. ships a large quantity of its coal to Canada.

Sunbury—Maintaining that the company was negligent in failing to provide sufficient protection against accidents, the Philadelphia & Reading Coal & Iron Co. has been made the defendant in a suit for $30,000 brought by John Colesbody, of Shamokin, who was crushed by a fall of coal in one of the company's collieries.

Hazleton—While boring for water, James Blanchard, an artesian-well driller, struck a bed of fine anthracite on the property of the Mill Creek Coal Co. Geologists had long asserted that coal measures did not exist north of the New Boston mines, but this recent discovery disproves their theory. Arrangements have been made to continue boring tests and it is altogether likely that a new operation will soon be started.

Jeddo—The new steel breaker of the G. B. Markle Co. was recently completed and the machinery given a trial run which was satisfactory in every particular. This work has been completed in a remarkably short time. Coal is now being run regularly through this plant.

Bituminous

Marianna—It is reported that the sale of the Marianna Mines to the Union Trust Co., of Pittsburgh, will be confirmed shortly, and that the mines will be open for operation by Aug. 15. It is said that this operation will be conducted under a company yet to be organized.

Elizabeth—Eight men were killed and 12 injured July 30 at the Patterson Mine of the United Coal Co., at Lovedale. A cable hauling a trip of cars up an incline broke, the cars ran down the hill, left the track at the tipple and fell something like 50 ft. into a gang of railroad laborers at work on a spur track under the tipple. Among those killed was F. P. Dougherty, superintendent of the mine.

Monongahela—Work in all the mines of the Pittsburgh-Westmoreland Coal Co., located in this section will be resumed in full at once. The company has received several large contracts from abroad. The mines affected are the Acme, Hazlekirk No. 1 and No. 2, Dunkirk and Schoenberger. Acme has been running one or two days a week and Hazlekirk men have been getting a day or so occasionally, while Schoenberger has been doing fairly well. Van Voorhis and Dunkirk have been closed tight for more than nine months. When these mines are working full it makes a material change in business conditions here.

Connellsville—Merchant coke operators of the Connellsville region are developing a healthy export business. Since the shipment of coke to Argentine Republic consumers, Italy is getting coke from here. A Uniontown firm also recently sold 44,000 tons of coal to a New York jobber for shipment to Spain.

Boswell—The Somerset County Miners' First Aid Meet, which has heretofore been held at Somerset will be held this year at Boswell on Sept. 4. This will give opportunity to a much larger number of miners to attend the meet.

WEST VIRGINIA

Charleston—It is reported that accidents and fatalities in West Virginia are increasing instead of decreasing. Records of 421 accidents were filed recently during one week, also the occurrence of 11 deaths through accidents; 85 accidents were recently reported in one day alone. This is a higher average than has ever before been known in the state.

A coal company operating in Fayette County recently sent a call to the Pittsburgh distribution branch of the U. S. Immigration Service for 1000 miners. Steady work and good wages are guaranteed. It is said that several thousand miners have been sent into West Virginia from Pittsburgh during the past few months.

The free employment bureau of the State Department of Labor recently had a call for 500 loaders and miners for immediate employment. These men were wanted to operate the Jamison Mines Nos. 7, 8, and 9, near Fairmont. No labor trouble exists at these operations, the need for the men being occasioned by an increase in production.

Fairmont—Two men were recently killed and one severely injured in a gas explosion at the shaft being sunk on Finch's Run by the Federal Coal Co. The men carrying an open light had gone down the shaft to do excavating work. They detected the odor of gas and were attempting to get back when the explosion occurred. The two men killed were Croatians and brothers.

Morgantown—Announcement has been made by the Board of Equalization and Review that the assessments on coal acreage of Monongalia County will be lowered from 5½ to 12 per cent. The percentage of decrease varying with the situation of the coal properties with respect to facilities for operation. This will, roughly estimated, lower the assessed value of coal properties in the county $1,275,000.

Leckieville—Four frame tipples are being built at this plant and endeavors are being made to have the plant in operation by the first of the year with a loading capacity of 4000 tons of coal per day. Work has been begun on 150 modern six and eight-room dwellings for the employees. Granolithic walks will be laid in the town and the streets will be macadamized. A modern school house will be immediately built and also a church. It is the intention to spare no expense in making this operation and town one of the most modern in every respect, including sanitation, amusement and recreation, to be found anywhere in the West Virginia coal fields.

KENTUCKY

Frankfort—A considerable portion of the contents of a new volume issued by the State Geological Survey deals with the coals of western Kentucky, the geological history of which section is traced. The report deals with the coals of the Nortonville, Drakesboro, Dunkor and Little Muddy quadrangles. Speaking of the coals the report says that they are inferior to the coals of eastern Kentucy, West Virginia and Pennsylvania and do not stand shipping as well as the Eastern coals, nor do they have the same clean appearance. They are bituminous, and, compared to the others mentioned, are relatively high in volatile matter, ash and sulphur.

MARYLAND

Cumberland—Four men, Elmer Kallmyer, William McLaughlin, and his two sons, William Jr., and George, were imprisoned behind a fall of roof in the Eckhart No. 3 mine of the Consolidation Coal Co., on the afternoon of July 27. They were rescued at noon the following day by State Mine Inspector William Walters and a rescuing party. The four imprisoned men walked out of the mine unhurt and little the worse for their experience.

OHIO

Steubenville—The mine of the Pluto Coal Co., at Rayland, has been closed indefinitely and the power house boarded up. Almost all of the machinery has been withdrawn from the mine and stored. This closes the plant indefinitely.

Glouster—At a meeting of miners recently held, resolutions were adopted protesting against the rates charged by railroads for hauling Ohio coals. It is declared that discrimination in favor of operators of other states has forced Ohio coal men to close their mines.

Columbus—The New Freight law, passed at the last session of the Ohio General Assembly, which changes the time of filing proposed changes in traffic rates became effective in Ohio July 30. The measure provides for a suspension of a proposed tariff increase when a petition is filed with the Ohio Utilities Commission. A suspension of 30 days may be granted for the purpose of investigating the reasonableness of the proposed increase and if that is not sufficient another 30 days' suspension is allowable. Heretofore carriers have been required to give only 10 days' notice of a freight change and now a 30 days' notice is required.

INDIANA

Evansville—The Big Four Coal Co., with a mine east of the city, has elected not to operate under the terms of the new state compensation law. Notice has been posted to this effect. Most of the mines in the Boonville, Ind., section operate under reciprocal insurance which, it is said, they have found cheap.

The state conference of the coal miners' unions of Indiana will be held here next March and several hundred delegates are expected. The compensation law, which will become effective Sept. 1, is expected to have an effect on the wage scale which will be a matter for discussion. Heretofore the state conferences have been held in Terre Haute.

Boonville—It is stated that the fire which has been burning for more than a year at the Polk Patch coal mines, doing thousands of dollars of damage, has been controlled by confining the area of the fire to 150 acres. This fire was started when a fireman threw a shovelful of hot coal cinders upon an exposed part of the vein.

ILLINOIS

Christopher—Eight men were killed and 15 injured when a part of the east mine of the United Coal Mining Co., near here, was wrecked by an explosion July 27. An explosion of gas occurred in the southeastern entry of Mine No. 1. The dead are John Parks, George Eimacis, Frank Ponaski, Everett Swofford, H. M. Dufour, Alfonso Dufour and Julius Takaseh. About 400 men were in the mine, which is one of the oldest in the state, but only a few were in the vicinity of the explosion. Work had been resumed the day before, after a shut-down of three months. The bodies were taken out by a rescue team that was summoned from Benton. Mine officials thing that gas accumulated in an old level causing the explosion.

Gillespie—The new Carlinville Coal Co. has started operations. For the present mules will be used, but in about six weeks it is expected to have electric haulage installed. A new boiler will also be erected, together with 6000 ft. of heavy steel rails. This company intends to make its own electric current with which to operate the haulage, screen, fan, etc.

IOWA

Des Moines—State Mine Inspector Edward Sweeney reports that 1,804,968 tons of coal were mined in Polk County by 2857 men during the year just past as against 2,264,260 tons during the preceding year. Only 4430 men had been employed in mines of Iowa during the year ending July 1, while 4563 men were employed the year before.

COLORADO

Denver—The new workmen's compensation law took effect Aug. 1 and all coal operators are busily engaged making provisions to comply with it. Although employers may elect to not carry indemnity insurance, it is unlikely that any will do so for the reason that such a policy must be publicly announced. This places such employers at serious disadvantage in securing competent laborers while it practically deprives them of all legal defense whenever suit may be instituted for injuries or deaths. Operators are permitted to provide compensation insurance in one of four authorized ways, viz., they may carry policies written by private insurance companies; they may carry their own risks by first satisfying the commission of their responsibility; they may combine with other employers in forming mutual insurance companies for such indemnities; or they may purchase polices from the state's compensation insurance fund. The recent announcement by the commission prohibiting insurance companies from offering any form of rebate, refund or profit-sharing features has considerably disturbed a number of contracts already entered into.

PERSONALS

Thomas J. McNamara has been appointed sales manager of the Pittsburgh & Southwestern Coal Co. with office in Buffalo. The company has a mine at Avella, Penn.

Prof. E. E. Bach, sociological superintendent of the Ellsworth Collieries Co. has been asked to serve as an official judge of the interstate mine rescue contests to be held at the Panama-Pacific Exposition, San Francisco, Calif., from Sept. 23 to 26.

J. B. Henderson, superintendent of the Fort Hill, Paul and Rainey plants of the W. J. Rainey Coal Co., retired on Aug. 1, after 35 years with that concern. Mr. Henderson will be succeeded as superintendent of the three plants by Alvin Mitchell, now superintendent at Acme.

C. F. Mayer, who has been traffic manager of the Sunday Creek Coal Co. for more than 10 years, has resigned, effective Aug. 1. He announces that he will take an extended vacation before taking up other work. The place with the Sunday Creek Coal Co. will not be filled for the time being.

J. F. Bermingham has been elected to the presidency of the Delaware, Lackawanna & Western Coal Co., succeeding E. E. Loomis. Mr. Bermingham's election is one step in the plan to separate absolutely the Delaware, Lackawanna & Western Coal Co. from the Delaware, Lackawanna & Western R.R. Co.

E. J. Wallace, formerly St. Louis manager for the Dealers' Fuel Co., has been appointed district sales manager of the Hoover automatic typewriter, with headquarters at Cleveland, Ohio, and branch offices at Toledo and Youngstown. Mr. Wallace was prominently identified with the coal trade in St. Louis for several years.

Thomas Graham was recently elected chairman of the western branch of the Canadian Mining Institute. Mr. Graham is chief inspector of mines for British Columbia. Among those elected at the same meeting to membership in the branch was Charles Graham, superintendent for the Corbin Coal & Coke Co., operating in the Crowsnest district.

OBITUARY

Robert Lang, 76 years of age, superintendent of the Hill Farm mine near Dunbar, Penn., at the time of the explosion occurring there in 1890, died in the home of his son, in Mt. Pleasant, Penn., July 27. Mr. Lang came from Scotland in 1865 and followed the mines until he was overtaken by his final illness a few weeks ago. For the last 15 years he has been superintendent of a small coal plant of the Lang Coal & Sand Co., in Connellsville; he is survived by three sons and one daughter.

Geo. D. McCreary, financier and coal operator, died of heart disease in Philadelphia on July 26, aged 69 years. He was a director in the Upper Lehigh Coal Co. and the Nescopec Coal Co., and was at one time a member of the wholesale firm of Whitney, McCreary & Kemmerer. He also served five terms as a member of the United States House of Representatives. Twenty-five years ago following the defalcation of an official he revised the financial system of Philadelphia, at the same time turning into the treasury over $70,000 in fees which had accrued to the position in addition to the salary. His action in regard to the fee system was followed by the State Legislature enacting laws eliminating this feature of the administration of city offices. He was also at the time of his death a director in the Market Street National Bank. Despite his varied business activities he was deeply interested at all times in charitable objects and was long noted for his generous philanthropy.

INDUSTRIAL NEWS

Buffalo, N. Y.—The Buffalo & Susquehanna Railway, extending from Buffalo to Wellsville, N. Y., is to be sold at public auction at Buffalo on Aug. 23.

Philadelphia, Penn.—The "Franklin," the first of six steamers being built for the Coastwise Transportation Co., for the purpose of engaging in the coal trade, will be launched in about a week. This boat will be followed by the "Plymouth" in three weeks, with the other four to take the water as rapidly as possible.

London, England—According to an order in council issued Aug. 3, after Aug. 30 British coal cannot be exported except to British possessions and protectorates. The export of coal has heretofore been confined to British possessions, and to countries which are allies of Great Britain. The present ruling eliminates all of these allies.

Buffalo, N. Y.—August G. Gutheim, special examiner of the Interstate Commerce Commission held a hearing in Buffalo on July 27 on the complaint of the Buffalo Union Furnace Co. and the Wickwire Steel Co., made against the Buffalo & Susquehanna Ry. Co., claiming that discrimination has been made against them by the road in favor of the Rogers-Brown Iron Co., in that they are obliged to pay 40c. a ton more for coke brought over the road from the ovens at Tyler and Sykes on the line of the road and 50c. a ton more for carrying pig iron than is charged the Rogers-Brown Co. The amount claimed is $200,000 by the Union Furnace company and $125,000 by the Wickwire company.

Hazleton, Penn.—Eleven years ago when the Lehigh Valley Coal Co. took over the Coxe mining interests in this district the purchase carried with it the Delaware, Susquehanna & Schuylkill R.R. The property was transferred to the Lehigh Valley R.R., which company in a short time practically abandoned it. However, it now develops that the coal tonnage passing through this territory has increased so rapidly that the Lehigh Valley in seeking relief from congested traffic has decided to reopen the old D. S. & S. line and by this means divert the anthracite shipments from the Schuylkill district at Coxton, thus shortening the haul to the Lake ports on shipments that formerly were compelled to pass through this city.

Portland, Me.—Contracts have been let for the construction of a coal pocket on Long Wharf for the Pocahontas Fuel Co. The plant will occupy practically the whole area of the wharf which will be rebuilt. The reconstruction of the wharf has been given to Roy H. Beattie, Inc., of Fall River. The coal pocket will have a capacity of 7000 tons of bituminous coal while 20,000 tons additional can be stored on the wharf proper. The pocket, trestles, elevated railroad and office will be built by J. W. Gulliver of Portland. The hoisting machinery will be furnished by the Lidgerwood Machine Co., of New York City, and the cable-car machinery by the Exeter Machine Works, of Pittston, Penn. The plant will be capable of unloading coal from vessels at the rate of 400 tons per hour.

Denver, Colo.—The American Coal Refining Co. is erecting a plant at 7th and Wewatta St., Denver, to handle 500 tons of lignite slack per day and to derive therefrom numerous products. Charles O. Hoover, vice-president and chemist, is commercializing certain processes of his own devising whereby he expects to extract from the lignite a binding liquid to be used in briquetting the same coal. The plant is planned to also manufacture a fluid resembling gasoline, usable as a motor fuel, that will be placed on the market under the name of "coaline." Commercial gas is another product. C. V. Fisher, of Kansas City, Mo., is president; Schuyler C. Peck, of Denver, is secretary and W. J. Stevenson, of Kansas City, is treasurer. The main office is at 406 First National Bank Building, Denver.

Cincinnati, Ohio—The United States Circuit Court of Appeals has handed down its opinion passing upon a motion filed on behalf of the Hocking Valley and Chesapeake & Ohio railway companies, requesting the approval of a scheme devised by those companies for the sale of their coal properties in compliance with the decree of the court handed down in March. The decision tentatively approves the plan suggested, which contemplates the organization of new companies to operate the coal properties whose purchase price will be largely taken care of by securities to be issued and turned over to the railroads. October 9 has, however, been fixed by the court as a date upon which the Government may submit any objections it may have to any of the details of the plan. The court entered an order dismissing petitions filed recently by John S. Jones against the companies, alleging failure to comply with a contract involving the disposition of the properties at issue, as the decision covers the entire question of the proposed sale.

Denver, Colo.—The Denver & Rio Grande and the Cripple Creek district railways recently announced an increase in freight rates, to become effective July 26, on coal from the Cañon City field to Cripple Creek points. The increase proposed was 50c. per ton, making the freight $3. However, the state public utilities commission suspended this increase and it cannot become effective until the commission decides that it is justifiable which is improbable in view of recent refusals of the commission to accede to similar requests to increase rates on coal from the South Cañon and the Palisades districts in western Colorado to Denver and points east. The commission refused hearings in numerous other applications, but, because of peculiar features in these particular instances, hearings were granted. It appears that the Colorado & Midland R.R., through its general agent, opposed the increase requested by the competing road—the Denver & Rio Grande R.R.—and evidenced its readiness to haul coal from the western slope points at rates even slightly lower than those proposed by the commission, by reason of its shorter mileage. It was this point that decided the commissioners who believe that the complaining roads can still compete at a profit.

Philadelphia, Penn.—Judge J. Whitaker Thompson, in the United States District Court, has sustained the validity of three indictments against the Philadelphia & Reading Ry. Co. in which it is charged with having transported coal to New England ports via a barge line owned by the company and for which it had not posted rates of freight, in violation of the inter-state commerce law. This decision is considered of great moment, as it indicates for the first time, it is claimed, the powers of a Federal Grand Jury. The indictments were first returned last December, when the Grand Jury subpoenaed officials of the railway to appear before it with their books, without any charges having been preferred against the company. The hearing was held in secret and following the information then elicited the indictments were returned. The company on an appeal succeeded in having these indictments quashed, its contention being that two stenographers had been present in the jury room in violation of the law. However, the Grand Jury at the March term reindicted the company, and the hearing just held was based on the indictments of the March jury. It is stated that the Government has brought the suit in order to obtain equal rates for independent shippers of coal via water to coast points, particularly the New England States. At the trial, the date of which has not as yet been fixed, the Government attorneys will endeavor to prove that the barge or towing lines come within the jurisdiction of the inter-state commerce commission and that the tariffs should, therefore, be filed for the inspection of all interested, as they allege the rates at the present time are secret and discriminatory as applied to other than socalled favored mining companies.

St. Louis, Mo.—The Missouri & Illinois Coal Co. filed suit in the St. Louis Circuit Court, July 28, against the Willis Coal & Mining Co. for $85,965.80 alleged to be due the Missouri & Illinois company under alleged verbal contracts. The petition recites that both companies own mines at Willisville, Ill., on the Mobile & Ohio R.R., and that in November, 1903, a verbal agreement was entered into for the Willis company to supply two-thirds of the railroad company's needs and the Missouri & Illinois company the other third. The Willis company was to contract in its own name and collect from the railroad company the price agreed upon and pay over to the Missouri & Illinois company for the coal delivered by it, the exact price paid by the railroad company to the Willis company. It is alleged that the verbal agreement was renewed from time to time and coal was furnished by the Missouri & Illinois company to the railroad company, under different contracts at prices ranging from 94½c. a ton to $1.12 a ton, between Apr. 1, 1904, and Oct. 30, 1914. The petition states that the Missouri & Illinois company did not become aware until Jan. 1, 1915, that the Willis company had not paid over to it all the money received from the railroad company for coal furnished by the Missouri & Illinois company. The claim of this firm is that it received $85,965.80 less than it was entitled to under the verbal contracts. In a previous suit, decided adversely to the Missouri & Illinois company, it sought an accounting. The Willis company contends that it did not agree to give the Missouri & Illinois company the price obtained from the railroad company. The Missouri & Illinois company has also filed in the United States District Court a suit against the Willis company and the Mobile & Ohio R.R. Co., under the Sherman anti-trust act, asking $450,000 damages on the ground of alleged conspiracy to monopolize a part of the coal trade.

Coal Trade Reviews

General Review

Anthracite continues heavy though operations are increased. The boom in steel and the new restriction on British exports are the predominating features in the bituminous situation. Less favorable crop outlook a depressing factor.

In spite of the fact that the anthracite demand has disappeared almost completely and the storage depots are generally choked with coal, some of the larger hard coalers have been able to increase their operations to practically full capacity for the time being, at least. An almost unprecedented dullness prevails in all branches of the trade, but this lack of buying will cause a tremendous rush when the fall trade opens up, and it is probable that operations are already being tuned up in anticipation of this. In the meantime the individuals are slashing the prices down to the full April circulars, and even occasionally offer still further inducements.

The tremendous boom in iron and steel has had a mildly stimulating effect upon the bituminous market, although not of sufficient proportions to relieve the pressure. Manufacturing plants have been pressed to accept so much coal throughout the season that they are not able to absorb much more. The most encouraging aspect of the current situation is the belief that it certainly cannot become much worse. Prices are standing up well considering the stress, but occasional demurrage consignments force out some extremely low quotations.

The export trade continues the leader. Practically all the Atlantic coast piers continue breaking previous high records month after month in an unprecedented manner, but even the gross tonnage involved is so small as compared with the production of the country, that it is hopeless to anticipate any general relief in this direction. The new British order prohibiting exports to their allies promises to throw a heavy extra demand on this country.

With the steel mills in the Pittsburgh district taking their maximum quota of coal, there is a better sentiment prevailing in the trade though this has not been reflected in prices as yet. Coal on track seems to be fairly well cleaned up, and with the heavy export movement from this district, the market should be fairly well sustained if operators do not crowd production too fast.

The only feature of interest in the Ohio market has been the inception of a state wide movement to promote the sale of the local product in preference to the West Virginia and Pennsylvania grades. The situation in the Ohio industry has become so acute as to elicit general concern on the part of the public and concerted action is being taken to relieve the distress developing in the mining regions. In the meantime the situation continues as discouraging as ever. Demurrage coal is forcing ruinously low prices while manufacturers are confining their purchases entirely to the spot market. Prices are generally so uncertain that the market is difficult to quote.

Uncertainties over the crop outlook in the Middle West, together with indications that production has been speeded up ahead of the absorptive power of the market has caused a general hesitancy throughout that section. Some demand for stocking purposes is appearing, but this business is much behind normal, and indications point to a congestion this fall. Confidence is still expressed over the future outlook, but it is noted that the agencies are displaying less assurance than formerly.

A Year Ago—Anthracite operations heavily restricted. European war disrupts routine business on the Atlantic seaboard. Market technically strong but subject to many disturbing influences. Middle Western situation improving.

BUSINESS OPINIONS

Boston News Bureau—One is obliged to diagnose the situation differently than in normal times. Somehow we seem to be in a period when it is unsafe to predict anything. Operating forces are largely in the nature of surprises. The minds of practically everybody are fastened on the European map. This country is deriving enormous advantage from the necessities of Europe. Money remains abundant and credit everywhere is free.

Iron Age—Pig iron, after being in a rut for months, while steel has been active at advancing prices, has started in the past week on what promises to be an important movement. Prices in all districts are up 25c. to 50c., and the sudden appearance of inquiry from many sources indicates an effort of consumers to forestall a long delayed rise. The country's July pig iron production was 2,563,420 tons, against 2,380,827 tons in June. The steel companies are now close to their maximum pig iron capacity. In only four previous months—January, February, April, and May, 1913—was the production of steel works furnaces greater than last month's. In steel products the week has been quieter. Most domestic consumers are apparently covered for several months and there is little or no protective buying.

Am. Wool and Cotton Reporter—Good wools are becoming rather scarce. Domestic wools are now more in demand than the foreign wools. There is more call for territorial wools than for fleeces or scoured wools. Further indication of increased activity in the goods market is reflected. In the woolen and worsted goods market the main feature in the situation is the satisfactory trade in staples.

Dun's—Important strides toward commercial and financial supremacy have been made by the United States during the year of war that has caused incalculable losses in Europe. Though there are still some drawbacks, such as the abnormal shipping situation, American enterprise is steadily reaching out to new goals, and confidence in the future is expressed on every hand. Bountiful grain crops seem assured, and these will be sold at remunerative prices.

Dry Goods Economist—Although no marked improvement has been noticeable during the week in business generally, the underlying conditions are stronger than they have been for some time and there is a quiet feeling that from now on business will steadily increase in volume. This feeling is all the more intensified by the fact that various local strikes, which at first looked very serious, have now been amicably settled.

Bradstreet's—Activity in iron and steel, continued improvement in industrial operations, diminished idleness, a quieter labor situation, a steady flow of orders for munitions of war, ease in money, some improvement in collections, fine crop news, and growth in optimism as to excellent business this fall, stand out in marked contrast to reports of midsummer quiet in trade circles and of slackness in industries not depending upon war orders.

Marshall Field & Co. — Weather conditions have been a serious handicap to dry goods distribution during the week, and wholesale shipments show a decrease as compared with those of the same week a year ago. Retailers, however, have visited the market in larger numbers than during the corresponding week last year. Collections are normal.

Southern Lumberman — While the volume of hardwood business done in July was little if any in excess of that of either of the two preceding months, the end of the month finds the market steadier and in somewhat better condition in numerous ways.

Armour & Co. — General trade continues to improve; increased activity in all industrial lines manifests itself. The Steel industry is on a sound footing; large number of men being employed, and the number being steadily increased; eastern plants working at maximum capacity and, in many cases, unable to meet demand; prices rising and firm.

ATLANTIC SEABOARD

BOSTON

Pocahontas and New River market druggy but no significant change in f.o.b. quotations. Occasional market cargoes serve to keep delivered prices down to minimum. Georges Creek plentiful and Pennsylvania grades continue very dull. Anthracite orders few and far between.

Bituminous—There is no significant change in prices f.o.b. Hampton Roads, although with all grades of Pocahontas and

New River trade is very light. Receipts on contract are relatively small and there are practically no current sales. Exports are still the mainstay of the market and while coal with individual shippers may be temporarily in short supply it is because output has been held down closer to the demand than was the case earlier in the season.

Occasional market cargoes have appeared the last week or so and some extremely low prices on cars are the result. While there is the chance of this as a factor in the trade there is little hope of improvement for a long time to come. Plants have been so pressed to accept deliveries the whole season through that they will make room very slowly. The textile mills usually make August a light month.

Georges Creek is coming forward freely on contracts and ample supplies are now available. The amount of foreign tonnage reporting for loading at Baltimore has sagged off materially, although this is regarded as only temporary. The shippers of the Pennsylvania grades are nearly all pressed with coal standing at the piers. Shipping orders are hard to get, even on good-sized contracts, and there will have to be a material curtailment to avoid lower prices. Several options for comprehensive tonnages to foreign buyers have not been exercised and the prospect is for dull business at least until September.

Water Freights—There is still an abundance of barge and steamer tonnage for what little business is offering. Rates, however, show no pariticular weakening. Sailing vessels are practically out of the market except for small coasters out of New York and Philadelphia. Freights offshore are still attractive enough to draw from the coastwise trade almost every sailing vessel over 700 to 800 tons; 75c. to Boston, 3000 tons upwards, is about the current quotation from Hampton Roads.

Anthracite—Trade is still very quiet. Some large discounts on egg and chestnut have been made by individual shippers; on chestnut as much as 50c. less than the company price has been reported in several instances. Orders are scarce but not unusually so for the time of year.

Prices on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.40@2.85	2.92@3.02	
New York*	2.40@2.95	2.70@3.15	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.65@2.80
Boston†	....	....	....	3.50@3.63
Providence†	....	....	....	3.45@3.68

* F.o.b. †On cars.

PHILADELPHIA

Anthracite shows slight improvement but is still extremely dull. Stove and egg in best demand, with chestnut the heaviest. Pea slightly stronger. Collections exceptionally bad. Midsummer quietness prevails in the bituminous trade. Steel boom being felt.

Anthracite—The slightly improved condition of the market as noted last week has continued but is only noticeable in the business of the large companies which advance prices on the prepared sizes each month. These companies produce the well known and standard grades that are always in demand and the dealers have placed quite a few orders this week to save the 10c. advance on Aug. 1. As a result of this improvement the Lehigh Valley, Reading and Lehigh Coal & Navigation collieries are working six days a week.

The individual shippers are offering any quantity of the prepared sizes at the April prices, and in a few instances where the order was made to carry chestnut even those figures were slightly shaded, probably by absorbing the tax. Chestnut size continues to give great concern as to its disposition.

Stove coal is the most active and is even occasionally scarce. Egg is also fairly active, but there were plenty of individual offerings of this size well off the current circular. Pea coal is still low in price, although the extremely low prices that have been prevalent were not so much in evidence this week, quotations ranging from $1.75 up to not more than $2 on the better grades. As indicative of the dealers' attitude toward the price on pea, one of the retail companies which was awarded a good portion of the school contract offered an individual operator $1.35 for 5000 tons of pea.

The poor collections continue and those most concerned with this end of the trade seem more worried about this feature of the market than any other. This applies to the wholesaler as well as the retailer. No retail dealer seems to have collected anything like a fair proportion on his spring deliveries and he in turn is naturally deeply indebted to the shipper. The opinion is that it will take some drastic movement like a strike or a long suspension to straighten out the market and stiffen prices.

With the worst month gone August can be looked forward to produce at least a slightly better tonnage. There are quite a few dealers who have not laid in any stock yet and who always linger along until this time so as to extend the time of payment of bills into the fall, until they can make some sales and thus do business practically on the shipper's capital.

Following their usual custom the large operators have issued their August price circular this week, increasing the prices on the prepared sizes 10c. per ton as shown below, to which should be added the Pennsylvania State tax of 2½%:

	Line	Tide		Line	Tide
Broken	$3.40	$4.55	Pea	$2.50	$3.25
Egg	3.65	4.80	Buckwheat	1.25	2.25
Stove	3.90	4.80	Rice	.85	1.75
Chestnut	4.05	5.05	Barley	.50	1.50

Bituminous—While the bituminous trade has been exceptionally dull for a long period, the feeling is that it cannot be any worse with the passing of July which is usually the dullest month of all. The last week showed an improvement due to the boom in the iron and steel trade, particularly those plants that have been waiting for the completion of additional buildings. The betterment has not been reflected in any increase in prices as yet. The tide shipments are good; in fact the July tonnage has broken records, being almost three times that for the same period last year, with prospects for an even better trade when additional ships are available. The prevailing prices are as follows:

Georges Creek Big Vein	$1.65@1.75	Fairmont gas, mine-run	$1.15@1.25
South Fork Miller Vein	1.50@1.60	Fairmont gas, slack	.65@ .75
Clearfield (ordinary)	1.00@1.20	Fairmont lump, ordinary	.85@ .95
Somerset (ordinary)	1.00@1.15	Fairmont mine-run	.75@ .80
West Va. Freeport	.85@ .95	Fairmont slack	.45@ .55

NEW YORK

Bituminous situation slightly improved. Spot demand better. Gas coal for South America. Export demand good. Anthracite market dull.. Individual coals at concessions.

Bituminous—Some dealers say there has been a slight improvement in the bituminous situation, but the majority believe the market shows no change. The demand seems slightly stronger and the prospects for a heavy fall business are good. Spot coal is still plentiful but there are not as many loaded bottoms as a week ago. Many contract holders are in the market for bargains and other large consumers who refused to sign up last spring are buying from hand to mouth, believing they will be able to get a sufficient supply as needed.

The mines as a rule are working on about a four-day-a-week schedule, although those producing the higher grades are doing better. By September dealers look for higher prices and a scurrying among large consumers with no contracts. Contract coals continue to move readily.

In the local harbor sufficient coal remains to supply all immediate wants. Occasionally it has been possible to pick up good bargains. Western Maryland has been quoted at from $2.30 to $2.35.

The export situation remains strong. Some contracts are about completed for shipments of gas coal to South America and it is reported that at least one New York house has about closed a contract with the Russian Government for a good sized block of coal. A detriment to the development of the foreign trade at present is the high freight rates.

Current quotations are on the following basis:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.30@3.40	$3.30@3.40	$3.30@3.40	$1.75@1.85
Georges Creek Tyson	2.90@3.00	2.90@3.00	2.90@3.00	1.35@1.45
Clearfield:				
Medium	2.65@2.80	2.55@2.65	....	1.10@1.25

Western Maryland		2.35@2.40	2.35@2.40	.80@ .85

Anthracite—Demand for prepared coals at Tidewater seems to have nearly disappeared and in the line trade all yards are reported filled. The expected rush the last week of July did not materialize and the new month has started out very quietly.

Independent coals continue to flood the market and has resulted in big concessions to bargain hunters. Quotations on individual coals have remained practically the same for two months and the opening of the new month sees no change. Everybody looks for a busy fall and winter. Retailers say they have enough orders on their books to keep them busy during September but that they cannot deliver any of the coal until ordered.

Of the prepared sizes stove is the strongest and nut the weakest. Pea is long and some good bargains have been reported. The buckwheat coals do not seem to be so plentiful but there has been no improvement in prices.

Current quotations follow:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.95		$5.00	
Egg	5.20	$4.70@5.20	5.25	$4.75@5.25
Stove	5.20	4.70@5.20	5.25	4.75@5.25
Chestnut	5.45	5.00@5.45	5.45	5.05@5.50

Rice	2 25	1.70@1.85	2.30	1.75@1.90
Barley	1.75	1.45@1.70	1.80	1.50@1.75

BALTIMORE

Coal Men more optimistic as tonnage movement and demand improve. Exports keep up and prospects for record-breaking period are bright.

From the mining sections of western Maryland, West Virginia and Pennsylvania come reports of increasing activity at producing points; that the movement for August will greatly exceed that of July is generally conceded. Many big plants are now working day and night on war orders of various kinds, and this is being felt along other lines of activity. Money is growing a little easier, and there are some who now believe the demand may be such as to tax the capacity of the mines before long.

While better grade coals are being held more closely the poor to ordinary fuels are still offered at very low figures. Lower-grade steam coals of Maryland and West Virginia are going at 75 to 85c., and run-of-mine gas is easy at 80 to 85c. Ordinary Pennsylvania grades are offering at 90 to 95c.

During the past week the coal-export movement took another jump. With a total of 65,484 tons of cargo coal exported for the last six working days of the month, the official total when issued will probably show between 232,000 and 235,000 tons loaded here for foreign ports for the month. With many charters announced or pending for August and September many persons are looking for a record-breaking coal movement on foreign account during those months.

Anthracite men are making spasmodic deliveries on early summer orders, but the whole of that field is extremely quiet. All sizes are in easy supply. A word of warning is being sounded quietly by some of the coal men regarding the possibility of strike troubles with the end of the agreements in the spring.

Tide prices on anthracite f.o.b. vessel, Baltimore, Md., are as follows:

Broken	$5.10	Nut	$5.60
Egg	5.35	Pea	3.85
Stove	5.35	Buckwheat	2.60

HAMPTON ROADS

Heavy export shipments continue. Italy still taking large quantities. Prices stationary. July dumpings reach million and a half tons.

The week's coal shipments from Hampton Roads ports have been heavy and a large percentage of the movement has been to foreign markets. Italy is still receiving a large portion of the export coal from this port. The largest single cargo of the week went to Cristobal, Canal Zone, being loaded into the collier "Achilles" and amounted to 12,000 tons. The cargo to Rotterdam was large, amounting to 8000 tons, and is particularly interesting from the fact that very little coal is shipped from Hampton Roads to Dutch ports.

There is little free coal at Tidewater at this time; practically all of the shippers are pushed for coal to take care of vessels in port and about due. Prices remain stationary and it is not believed that even with the heavy demand that there will be any increase.

The dumpings for the month of July will be around a million and a half tons; on the morning of July 31 the Norfolk & Western at Lambert Point had gone over 800,000 tons, the Chesapeake & Ohio Ry. at Newport News over 429,000, and the Virginian Ry. at Sewalls Point about 300,000 tons. This will therefore make the month of July break all previous records at Hampton Roads and prospects are even now bright for August to exceed the July movement.

Railroad Tonnages—Dumpings over the local piers for the past several weeks compare as follows:

	Week Ending				
Railroad	July 3	July 10	July 17	July 24	July 31
Norfolk & Western	211,017	174,822	180,090	197,913	188,593
Chesapeake & Ohio	83,678	76,397	116,862	96,627	84,018
Virginian	58,455	57,467	78,710	86,523	39,335
Totals	291,828	308,686	375,662	381,063	311,946

OCEAN FREIGHTS

A number of large British steamers were offering last week at $8.28 for coals to Lower Plate ports, at which rate a few of these steamers were chartered, but neutral tonnage is difficult to obtain for this voyage even at $8.40. Mediterranean freights are firmer, owing to the competition of grain, which is now actively in the market, and rates to Cuban and West Indian ports are also firmer, on account of the limited supply of tonnage available for these trades.

To	Rate	To	Rate
Havana	$2.25@2.75	Bermuda	**$3.00**
Cardenas or Sagua	3.00@3.50	Vera Cruz	3.25@3.75

LAKE MARKETS

PITTSBURGH

Conditions not materially improved but sentiment much better. Export demand for Connellsville coal improved. Operations at 50 to 55% of capacity.

On the whole, there is no improvement in the coal situation in the Pittsburgh district, but there has been a decided improvement in sentiment, and much stronger hopes are expressed that there will be a marked improvement before the Lake shipping season closes. The steel industry is now taking very nearly its maximum quota of coal, as the mills in the Pittsburgh district are operating very nearly at capacity, though their tonnage output and consumption of coal are not as large as they would be in cooler weather with the same equipment nominally in operation.

Shipments in the Lake trade continue light, and the sharp increase that was expected for August is as yet showing little signs of materializing. Export demand continues to increase, and the Connellsville district operators are shipping larger tonnages than ever. Five of the largest mines of the Monongahela-Pittsburgh-Westmoreland Coal Co. were ordered on full time to fill exceptionally large export orders. Slack maintains the firmer level recently quoted, production being light for this time of year and demand fairly adequate.

Prices for free coal are not quotably changed and stand as follows: Slack, 50@55c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. On contract to Apr. 1 prices are a shade firmer than for free coal, mine-run being available at $1.05@1.15. Pittsburgh district operations remain at an average of 50 to 55% of capacity.

BUFFALO

Bituminous still improving and slack about normal. Outlook for a good fall trade ahead. Anthracite not moving yet, but expected to early in fall.

Bituminous—A better volume of trade is reported, with good prospects of plenty to do by fall. The best feature is a larger demand for slack, which has advanced to a profitable level. If the Lake trade should become active the situation would be fairly good, so far as the volume of business is concerned, though it is not likely that the prices will advance. Some jobbers who have often been buried in coal that they could not sell at any price are now reporting that they have not a single car on track and that there seems likely to be demand for all they get from this time on if the mines do not crowd the production too much.

The improvement naturally follows the stir in iron and this promises to continue. The Lackawanna Steel Co. reports that it has orders three months ahead and other concerns are also quite active. While there is no real advance in prices the market is much firmer, and there is no further report of badly cut prices to move stranded shipments. Quotations are steady on the basis of $2.70 for best Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack.

Anthracite—The trade has not improved. There was some expectation of the usual small spurt at the end of the month, but the increased demand was not large. It is the idea of certain shippers that the spurt at the end of August will be quite large and that the demand will then continue through the fall, and culminate in a big rush by early winter. Shipments by Lake are much smaller than a year ago, on account of the filling up of the Upper-Lake docks. The amount loaded for the week was 102,600 tons and for July,449,012 tons, as against 810,410 tons in July last season and 1,869,390 tons for the season, as against 2,219,735 tons to August last season.

TORONTO, CAN.

Plentiful supplies and market continues dull.

Trade continues very dull, buyers as a rule only ordering for immediate requirements. There are full supplies on hand in all lines and but little coal coming forward, as nearly all the yards are stocked up to full capacity. There has been no change in prices, which are likely to continue as at present until September, when the usual advance in anthracite is anticipated. Quotations for best grades are as follows: Retail, anthracite egg, stove, and nut, $7.50; grate, $7.25; pea, $6. Bituminous, steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $8. Wholesale f.o.b. cars three-quarter lump, $3.56; screenings, $2.90.

TOLEDO

Lake movement light at Toledo.. Market fails to show any improvement otherwise. West Virginia grades in best demand. An acute situation developing as regards the Ohio industry.

The trade is showing a moderate improvement and prices are holding fairly close to list. The Lake trade has not shown much increase and steam coal is not particularly firm. Domestic grades are better and are expected to improve from now on. Pocahontas continues very firm although there seems to be a trifle better supply. Anthracite is selling off the list here which is most unusual. Steam coal of all kinds is slow and prices are weak. The threshing season is late owing to wet weather and this has delayed the demand from this source. Stocking will begin within a short time now which will give some impetus to the trade. Contracts are not being made very freely, many concerns which usually have their contracts all closed up by this time now buying bargain coal off the tracks.

Ohio operators declare that it is impossible to compete with West Virginia under present operating and traffic conditions. Ohio miners are actually suffering from lack of work and following the Governor's call for financial assistance for the miners and their families a "Buy Ohio Coal" campaign was started at Athens and is gradually spreading over the state. It is hoped this will improve matters somewhat but Ohio operators feel that the lawmakers and public opinion must straighten out the tangle if Ohio mines are again to be operated.

COLUMBUS

Slight improvement in the domestic trade. Steam business is still slow. Production at a low ebb.

There has been a fairly steady demand for domestic sizes for stocking purposes, but the volume of business is hardly equal to that of former seasons. The tone of the market is not very good and the trade is playing a waiting game.

Stocking of Pocahontas and West Virginia grades is the best feature at the moment. There is a fairly good demand for Pocahontas, due to the increase of 25c. per ton on Aug. 1. White ash and other West Virginia grades are also moving fairly well. It is still too early for any extensive movement of Hocking, although some is being purchased by dealers. On the whole, the stocks in the hands of dealers are not as large as usual at this time of the year. Retail trade is fairly brisk, especially to householders. There appears to be a better demand for anthracite than ever before.

Steam trade is still dull and there is no immediate hope for improvement. Manufacturing plants are only buying from hand to mouth and are apparently loath to accumulate stocks; much of this buying is in the open market. But few contracts are expiring and the work of renewing is difficult. Railroads are using only a fair amount of fuel.

Lake trade is still dull in every particular. Reports from the Northwest show that there is a considerable tonnage on the docks of the Upper Lake ports and the movement to the interior is slow. The Sunday Creek Coal Co. has not started Lake shipments and may not ship any Lake coal at all this season.

Prices are being fairly well maintained in the retail field despite the depression. Dealers are not inclined to sacrifice profits for business. Some cutting is reported but not sufficient to demoralize trade in the least.

Prices in Ohio fields are as follows:

	Hocking	Pomeroy	Kanawha	Eastern Ohio
Rescreened lump	$1.50	$1.55		
Inch and a quarter	1.35	1.35	$1.30	$1.25
Three-quarter inch	1.25	1.25	1.25	....
Nut	1.15	1.25	1.15	....
Mine-run	1.05	1.10	1.05	1.00
Nut, pea and slack	.65	.70	.65	.60
Coarse slack	55	.60	.55	.50

Mines have been working at about the following percentages of full capacity.

District	Week Ended July 10	July 17	July 24	July 31
Hocking	20	25	25	15
Jackson	15	25	20	20
Pomeroy	45	40	40	35
Crooksville	30	20	20	20

District	Week Ended July 10	July 17	July 24	July 31
Cambridge	25	35	25	30
Masillon	25	30	25	25
Eastern O.	60	50	55	50
Average	31	32	30	29

CLEVELAND

Eastern Ohio slack and other Ohio fine coals are selling at $1.55 to $1.65, largely because of the contracts closed the last few days. Pennsylvania grades are not quite so strong.

In the last few days a number of Ohio furnaces have closed for their requirements at 75c. for No. 8 slack at the mines. The National Tube Co. at Lorain, Phillips Sheet & Tin Plate Co. at Canton, La Belle and Cambria at Steubenville and Mingo Junction, Carnegie Steel Co. and others have contracted. Excepting the Lorain contract the freight rate is 25c. a ton.

This has taken all the No. 8 slack that is being produced and to give any one else coal the operators must spread it over their trade on a proportionate basis as the steel companies could use more than they are getting. As a result of these contracts No. 8, Middle district and Goshen fine coals are worth $1.55 to $1.60 at Cleveland. Fairmont is on about the same basis while Pan Handle is worth only $1.50 and Youghiogheny, $1.60.

The coarse coal market is unchanged and the market for Lake coal is very quiet. Lake coal shipments are at the low point of the last month with no improvement in sight for at least another month. Pocahontas lump and egg are firmly held at $3.70 delivered at Cleveland, with mine-run at $2.70, though not particularly firm.

CINCINNATI

A shorter car supply and the advancing season furnish some ground for hope of a better market, but demand continues extremely dull. Price concessions are common.

There has been some demurrage coal on the local market during the past week, which is rather unusual at this season. There are some hopes that the beginning of the end of the unprecedented slump is at hand, as the first of August should certainly bring some buying while reports of car shortage at several points indicate that there may be some trouble in taking care of a normal movement later on.

With prices completely demoralized, however, it is difficult to quote the market. Some of the larger retail concerns are putting in their usual supplies at their regular prices, but the smaller retailers, especially out in the state, have suffered considerably from bad credits, and are not anxious to buy any more coal than they have to. The steam market, on account of the dullness in manufacturing circles, is not much, if any better off.

LOUISVILLE

Slight improvement in domestic coals but the general market continues heavy.

Some welcome improvement in the Kentucky coal market has been noted chiefly in the domestic line. The domestic demand has been late in developing and has not reached anything like the normal volume. As yet prices have shown no stiffening. Block coals of the better grade continue at from $1.25 to $2, those operators who are holding out for the top prices not selling as much as the others. Nut and slack range from 25 to 40 and from 50 to 60c. f.o.b. mines, according to grade.

BIRMINGHAM

Coal market improving and operations are much better.

Keeping pace with the improving iron market, the coal business in this district is in better shape now than it has been for at least twelve months. Indications point toward the last six months in this year showing an increase of at least 50% more than during the first six months. Many of the mines that have been closed down since early last fall have resumed. Orders are coming in better, and for larger tonnages, both on steam and domestic coal; as several of the furnaces in the district which have been out of blast for nearly a year are resuming operations, and the mines are running on an average of 4 to 5 days per week, with a few of them making six days. General conditions in iron and other products are better in every way, and conditions are apparently becoming normal.

COKE

CONNELLSVILLE

Small slump in prompt furnace. Market generally quiet. Wilpen coke works to resume. Production and shipments slightly decreased.

The coke market has been disturbed by a conjunction of unfavorable elements affecting the spot situation. Five or six consumers gave instructions for shipments to be curtailed on their contracts, just at a time when production by merchant ovens had been increased in expectation of heavier demand in the near future. As a consequence prices for spot furnace coke broke, and there have been free offerings at $1.60 while it is quite possible that an even lower figure could be done. The situation is tending to right itself as some ovens were put out last week. The recently advanced quotations on contract have not been realized, as demand on contract has been light, and some operators are ready to quote slightly less. The market stands as follows: Prompt furnace, $1.60; third-quarter furnace, $1.75; contract furnace to Jan. 1, $1.85@2; prompt foundry, $2.20@2.40; contract foundry, $2.25@2.60, per net ton at ovens.

The Shenango Furnace Co. is about to blow in an additional furnace at Sharpsville and will start its Wilpen coke works, in the Upper Connellsville or Ligonier district, containing 150 ovens. The plant has been shipping coal for export and will continue to do so.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended July 24 at 367,095 tons, a decrease of 4049 tons, and shipments at 360,852 tons, a decrease of 4763 tons.

Buffalo—The demand is much better than formerly and though it does not increase materially it appears likely to hold, particularly as the Lackawanna Steel Co. reports orders three months in advance and increasing. Ore movements by Lake are active. All reports from the coke-oven district agree that the output is now large, though it is feared that too many ovens will be put into operation before the market steadies down. Prices are strong on the basis of $4.25 for best Connellsville foundry and $3.30 for stock coke.

Chicago—Domestic sizes have been in better demand during the past week, with prices a little stronger. The general tone of furnace and foundry coke is steady. Quotations are as follows: Byproduct, $4.65@5.10; Connellsville, $4.75; Wise County, $4.65@4.75; gas coke, $3.75@3.90, furnace, $4.85.

MIDDLE WESTERN

GENERAL REVIEW

Sales slightly larger and prices a trifle stiffer. Domestic shipments increased. Screenings softer. Smokeless coals strong. Anthracite dull.

There has been no evidence of a heavier movement, and it is difficult among the conflicting reports to obtain a correct perspective of the immediate future. The production of coarse coal is increasing so that there are more screenings thrown on the market than can be readily absorbed. City retail yards are still buying sparingly, and the increased shipments have mostly gone into the country districts for threshing purposes. Several contracts have been placed by local retailers during the last week, with deliveries to be made later in the season.

The general opinion is that production has been speeded up ahead of the demand. The movement of tonnage in July did not come up to expectations. Illinois screenings are quoted as low as 60c. with Indiana Fifth and Sixth Vein at 65c., Fourth Vein at 80c., and it is felt that the decline has not been checked. The industrial demand grows very slowly, and evidently there are not enough orders from this source to absorb production of steam coals. Lake shipments are slowly increasing, but the tonnage moved is falling considerably behind previous seasons and there are little hopes for any material improvement until the latter part of the current month at least.

CHICAGO

Market hesitating due partially to uncertainty of crops. Prices generally well maintained. Several new advances in circulars Aug. 1. Higher anthracite freights to Western points.

Shipments to Northwestern points from Southern Illinois mines are being somewhat retarded on account of wet weather. The dealers do not wish to accept threshing coal until they are sure as to the result of the wheat crop, and many things can happen to prevent a large yield. Prices in the Northwestern markets range at circular quotations, or very close thereto.

The summer business in the Peoria district both from the retailer's and operator's standpoint has been very satisfactory so far; prices have been well held, and the larger industrial establishments have been running full time.

Southern Illinois screenings have been on the down grade but it is reported that $1.60 will be the minimum price on domestic lump this month. The demand for Harrisburg lump has been quiet, and steam lump from these mines has been moving very slowly. All Carterville coals have been in steady demand with prices well maintained.

In the Springfield district, domestic lump has been quiet with a steady demand for screenings at closer to list prices than for several weeks past.

The demand for Indiana domestic coals shows an improvement, but steam grades are moving unusually slow. Screenings from Third, Fourth and Fifth Vein mines in the Clinton and Knox County districts have been moving more briskly at fair prices, while there has been an accumulation of fine coal at Fifth and Sixth Vein mines in Sullivan County, and even at reduced prices screenings from these mines have been slow sale.

Smokeless products are very firm. On July 25 several large producing companies put the August schedule of $2.25 for lump and egg into effect. This new schedule has toned up the market for these grades and resulted in some orders before it became effective.

Pennsylvania smokeless prepared sizes, with the exception of egg, are in better demand at improved prices. Mine-run is quiet, and egg size is very slow.

Orders for Hocking domestic lump are coming in more freely, and jobbers report a better demand for all sizes in eastern Indiana and Ohio. Prices on 2- and 3-in. lump average between $1.35 and $1.60, with $1.25 to $1.50 for 1¼-in

Prices for Kentucky coals are still uncertain. The demand for block is very light, and all other sizes seem to be sold at any price to make a sale.

An advance of 25c. per gross ton occurred in the through rates on anthracite to Western points on July 17, and what effect this will have on future prices is questionable. There has been no rush of orders at the end of the month, and it looks as though the dealers have postponed most of their buying for another month. It is felt that the higher rates will mean an advance in the cost of coal delivered at Western points.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.
Lump	$1.35@1.50	$1.35@1.50	$1.35@1.50	$1.35@1.55	$1.40@1.50

ST. LOUIS

Increased circulars became effective Aug. 1. Market otherwise dull. Consumers not stocking as much as normally.

August brought with it a marked advance in Williamson and Franklin county prices, with the latter the highest, and there are also changes in the quotations in other fields. Screenings remain low and the market is dull. Domestic orders are not coming in as well as is usual at this time. Householders are putting off as long as possible the laying in of the winter's fuel. It is expected that this will cause a congestion of orders and an advance in prices about Sept. 1.

The quotations on the first of the month were:

	Wilm. & Frnk. Co.	Sparta	Mt. Olive	Standard
6-in. lump	$1.35@1.50	$1.25	$1.35	$1.05
2-in. lump	....	1.00	1.25	.95

Screenings	.60@ .65	.65	....	.60

INDIANAPOLIS

The fall demand on the Indiana block fields has begun and mines are going on full time one after another. Situation and prices unchanged in the main fields. Retail movement good for the season.

The chief change in the local market has been the picking up of business in the Brazil block fields. Unlike other Indiana coal this may be stored and the movement to the Northwestern states has begun. The mines in this district will all soon be working good.

In the other districts, conditions are little changed though an improvement seems imminent. Railroads are busy getting their equipment ready for the crop movement, which is late on account of unfavorable weather. These preparations seem to be on a large scale, for crops are large though the quality is not the highest. The demand at Chicago has not improved. Indianapolis retail yards are moving considerable quantities of Eastern coals into consumers' bins. Prices generally are unchanged. Screenings, which turned easier the latter part of July, hold firm against any further softening.

KANSAS CITY

Wholesale market shows a slight activity but retail continues heavy.

There has been no change in the retail market during the past week. Prices are the same and if anything the demand has decreased. The wholesale market has shown a little more activity and the number of contracts being let has caused not a little excitement in the coal circles. A great many of the operators and companies are advertising coal in the daily papers and advertising the purchasing of the year's supply now.

PRODUCTION AND TRANSPORTATION STATISTICS

NORFOLK & WESTERN

Destination of shipments over this road for June of this year, the six months of this year and last year were as follows, in short tons:

	June		Six Months	
Coal	1914	1915	1914	1915
Tidewater, foreign	160,300	529,509	922,045	1,668,275

FOREIGN MARKETS

GREAT BRITAIN

July 23—The strike having been settled, work has been generally resumed at all the pits. Business is on very quiet lines at present. The market is unsettled and there are prospects that it will remain so until about the early part of August. The following are the nominal quotations:

Best Welsh steam	Nominal	Best Monmouthshires	$6.00@6.24
Best seconds	Nominal	Seconds	5.76@6.00
Seconds	$6.24@6.48	Best Cardiff smalls	5.16@5.40
Best dry coals	6.00@6.48	Cargo smalls	4.08@4.32

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering, while a little more active, continues on limited lines because of the difficulties following the miners' strike. Tonnage for prompt positions is offering abundantly. Rates are nominally as follows:

Gibraltar	$3.84	Naples	$4.80	St. Vincent	$4.32
Marseilles	3.81	Alexandria	5.52	Rio de Janeiro	6.24
Algiers	3.48	Port Said	5.28	Monte Video	5.76
Genoa	4.80	Las Palmas	4.08	River Plate	6.00

Later—Cable reports under date of Aug. 3 state that Great Britain will place a rigid embargo against coal exports of any kind to other than British possessions and protectorates. The embargo will become effective Aug. 30. Several months ago an embargo was declared against foreign shipments to other than British possessions, protectorates, and her allies in the war, but apparently even these latter are now to be excluded from obtaining the British product.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

✚Indicates contracts regarding which official information has been received.

Recast

G. Coyle & Co.**, on the following basis: Anthracite egg, $8.35; nut and stove, $8.45; bituminous "Sipsey," $3.85. Address Secy. E. A. Williams, Bd. of Edu., 4th floor, Municipal Bldg., New Orleans, La.

+No. 924—Indianapolis, Ind.—This contract (Vol. 7, p. 1127), which provides for furnishing the fuel requirements of the local Board of Education and for the county poor, has been awarded to the **Commercial Fuel Co.** The bids received including that of the Commercial Co. were as follows:

	No. 4 Linton	No. 6 Buller	Pocahontas
Indianapolis Coal Co.	$2.60	$2.50	$3.60
A. B. Meyer & Co.......	2.75	2.75	3.75
Mortar & Fuel Co........	2.69	2.69	3.79
Commercial Fuel Co......	2.58	2.50	3.55

Address Trustee John W. Castor, 317 Saks Bldg., Indianapolis, Ind.

+No. 927—Shelbyville, Ind.—This contract (Vol. 7, p. 1127), which provides for furnishing the County Court House, Jail, Orphans Home and County Farm with coal during the ensuing year has been awarded to **J. O. Parrish Co.**, at the following prices: Orphans Home, $3.45; County Farm, $2.80; County Jail, $3.55. Address Aud. Frank W. Fagel, County Comr., Shelbyville, Ind.

No. 934—Worcester, Mass.—This contract (Vol. 7, p. 1127, Vol. 8, p. 40), which provides for furnishing the various public buildings with coal during the ensuing year, has been awarded to the **Peoples Coal Co.**, which was the lowest bidder at $4.57 per ton or more. Complete list of bids was given in previous issues. Address Supt. of Pub. Bldgs. George C. Halcott, Room 35, City Hall, Worcester, Mass.

+No. 935—New York, N. Y.—This contract (Vol. 7, p. 1127, Vol. 8, p. 115), which provides for furnishing the Department of Docks and Ferries with coal, has been awarded to the **Clarksburg Coal Mining Co., Inc.**, at $1.94 per ton. Address Com. of Docks R. A. C. Smith, Pier A, foot of Battery Pl., N. R., New York.

No. 937—Amsterdam, N. Y.—This contract (Vol. 7, p. 1127, Vol. 8, p. 76), which provides for furnishing the local Public Schools with approximately 900 tons of various grades of coal, was bid on by 11 different bidders, and each one was awarded the contract for supplying the coal at one school. Address Clk. Leslie L. Bedd, Bd. of Edu., High School Bldg., Amsterdam, N. Y.

+No. 947—Towson, Md.—This contract (p. 40), which provides for furnishing the Maryland State Normal School with approximately 800 gross tons of Georges Creek Big Vein coal has been awarded to the **Enterprise Fuel Co.** at $3.29 per gross ton. Address Secy. M. Bates Stephens, State Bd. of Edu., Annapolis, Md.

No. 961—New York, N. Y.—This contract (Vol. 8, p. 41), which provides for furnishing the City College with 4800 tons of No. 3 buckwheat and 1600 tons of semibituminous mine-run, has been awarded to **Charles D. Norton Co.** at $2.33 per ton for the buckwheat and $3.31 for the mine-run. Pattison & Bowns bid $2.49 for buckwheat and $3.41 for the mine-run. Address Curator of the College, Room 114, Main Bldg., 139th St. and Convent Ave., New York City.

Contract Notes

Buffalo, N. Y.—Col. F. G. Ward, Commissioner of Public Works, buys all the coal for the public buildings at this place.

Shelbyville, Ind.—The contract for furnishing the county schools with coal during the ensuing year, has been awarded to the **J. O. Parrish Lumber Co.**

Bismarck, N. D.—The State Board of Control of Penal and Charitable Institutions let the contracts for furnishing coal to the various institutions under its charge.

New Orleans, La.—The Sheffield Steel & Iron Co. has renewed their contract with the **New Orleans Street Ry. Co.** for 200,000 tons of coal for 1916 at an advanced price.

Tipton, Ind.—The County Commissioners awarded their contract for coal for the Court House, Jail and Infirmary to **Joyce & Jarvis**, of Elkin, Ind., at $2.75 a ton for West Virginia nut, f.o.b. Tipton.

Hillsboro, N. D.—The contract for furnishing the local power house with coal during the ensuing year has been awarded to the **Hillsboro Lumber Co.** Address City Audr. N. G. Nyhus, Hillsboro, N. D.

Norfolk, Va.—Seven bids were submitted for furnishing the local Water Department with coal during the ensuing year, the quotations ranging from $3 to $4 per ton for lump, $2.88 to $3 for mine-run and $2.60 to $2.75 for slack.

Port Huron, Mich.—The West Virginia Pocahontas Coal Sales Corporation has the contract for furnishing the local water works department with their fuel requirements. The contract is being filled with Panther 1¾-in. lump coal.

+Indianapolis, Ind.—Contract of the Artificial Ice & Cold Storage Co. for yard requirements of lump, egg and nut coal, has been placed with the **Consolidated Indiana Coal Co.**, to be shipped in monthly installments. The contract expires Mar. 31, 1916.

New Orleans, La.—The contract for supplying 1200 tons of bituminous coal to the New Orleans Custom House for the fiscal year ending June 30, 1916, was awarded to the **H. P. Hyams Coal Co.**, of this city. The coal was purchased under a B.t.u. guarantee.

The Car Supply—A number of railroads are giving warnings as to car shortages to be expected this fall and winter. Several carriers are taking measures to forestall trouble by increasing their repair forces and placing restrictions in the way of supplying cars, even at this early date.

The Fall Outlook—Talk of slow car movement in the late fall and winter is again heard and the fact that some operators are proceeding cautiously on new business is causing some of the prudent buyers to give it consideration. There is more than a possibility it will be an interesting fall.

New Orleans, La.—The two low bidders on the United States plant coal contract, noted in a previous issue (Vol. 7, p. 1050), the **Tennessee Coal & Iron Co.** and the **R. B. Hyams Coal Co.**, have been awarded the contract. Address United States Engineers Office, Room 325, Custom House, New Orleans, La.

Middle West—The continued encroachment of foreign coals into home territory is causing the Indiana operators much concern, and they are about to inaugurate a campaign of publicity to increase the consumtpion of Indiana coals at home, especially among state and county institutions, the majority of which are now using Eastern coals.

Pawtucket, R. I.—The Lossaine Mfg. Co. at this place consumes about 12,000 tons of New River and buckwheat coal, deliveries being made at the rate of about 100 tons per month by water to Providence, and from there to Pawtucket by rail. The company has a storage capacity of 3000 tons. Address W. W. Jollie, Lossaine Mfg. Co., Pawtucket, R. I.

Knoxville, Tenn.—Press reports are to the effect that the **Southern Coal & Coke Co.** have secured orders aggregating 220,000 tons of coal to be shipped into the Ohio territory. About 40,000 tons of this are said to have been placed with a western railroad, this representing their first purchase of this grade of coal. All of this business was obtained in close competition with Pennsylvania and West Virginia mines. The coal will be distributed from Cincinnati, Dayton and other Ohio and Indiana points.

Springfield, Ill.—The City Government has made the following awards covering municipal coal contracts, and at less prices than of recent years: **Jones & Adams Coal Co.**, 1¼-in screenings for use at electric-light plant, at $1.02½ per ton; same at water-works plant, $1.03½ per ton; **Colvin Coal Co.**, lump coal for city buildings, at $2.30 per ton delivered. The city owns and operates a municipal electric-light plant and water-works, and in addition to this considerable fuel is used for heating various city buildings.

COAL AGE

Vol. 8 NEW YORK, AUGUST 14, 1915 No. 7

The Coal Miner's Creed

I BELIEVE in the future of the coal industry; my mine and my job.

BELIEVE that the time will come when the public will recognize wholly the usefulness of the coal-mining business and will give it the same liberal measure of cordial support that it gives other industries.

I BELIEVE the time will come when all operators will make a fair profit, nothing less, and when all employees will make a fair wage, nothing less.

I BELIEVE the time will come when wasteful methods will be eliminated, accidents reduced, operation steadier and more coal reclaimed.

I BELIEVE the time will come when all operators will be honest, when contracts will be filled to the letter and when substitution will be unknown.

I BELIEVE the time will come when all miners will desire to be efficient, honest and temperate workmen; when supervision will consist of directing alone.

I BELIEVE the time will come when miners will live in comfortable dwellings in clean towns.

I BELIEVE the time will come when employers and employees will live up to wage scales at all times.

I BELIEVE the time will come when miners and operators will understand that their interests are identical; when labor wars will cease.

I BELIEVE that all these conditions will come in time, and as the time seems slow in coming—

I BELIEVE I'll get behind all good movements now—and *push!*

Discharge Flow and Crank Effort in Various Pumps[*]

By J. E. Holveck[†]

SYNOPSIS—An analysis of the conditions existing in power-driven plunger or piston pumps. A proper arrangement of cylinders and cranks reduces the variation of torque from 318 per cent. in the single-cylinder single-acting pump to 7 per cent. in the single-acting quintuplex machine.

There seems to be some misunderstanding as to the actual fluctuation in discharge of different types of crank-driven reciprocating outside packed plunger pumps. This subject is clearly treated in a number of text-books on pumps, which show diagrams similar to those in this article, covering duplex and triplex machines. To the best of my knowledge and belief curves of the quintuplex, or five-cylinder, type have never heretofore been published; nor does the literature on the subject contain any figures showing what the variations in the different types are.

For the benefit of those interested in this subject I will endeavor briefly to outline the formula for determining and graphically representing the discharge variations in pumps most commonly used at the present time.

The action of water in a pump cylinder and discharge pipe is determined by the plunger moving in a straight line and connected to a crank pin having a constant, rotary motion. While the velocity of the crank pin is constant, that of the plunger varies throughout the stroke from zero at dead center to maximum, with the connecting-rod at right angles to the crank.

Knowing the velocity of the plunger, the displacement or discharge can be readily ascertained for every position of the crank pin, since the rate of displacement is directly proportional to the velocity of the plunger.

By using ordinates to represent rates of displacement in cubic inches and abscissa for time we may construct a true diagram graphically illustrating the discharge from a plunger. If the curves of each plunger for any multi-plunger pump are combined in proper sequence as to time, the discharge for any pump is determined.

Let

F = Area of plunger in square inches,

W = Radians per second or angular velocity of crank pin $= \frac{\pi N}{30}$

r = Crank circle radius in inches,

N = Number of revolutions of crank per minute,

u = Velocity of plunger in inches per second,

a = Crank angle,

L = Length of connecting-rod.

The equation for plunger velocity then is

$$u = Wr\,(\sin a \pm \tfrac{1}{2}\frac{r}{L}\sin 2a)$$

and

Fu = plunger displacement in cubic inches per second.

As the crank-pin velocity is constant, the time for any position of the plunger is a function of the crank angle,

$$t = \frac{a}{360}T$$

in which t represents abscissa or time elapsed until any crank angle has been attained and T represents the total time for one revolution.

Fig. 1 represents the discharge curve of a single-plunger single-acting pump. The circle at the left of the figure is laid out to any scale with a radius FWr, or the cubic inches per second of displacement, this being a function of the crank-pin velocity. The length of diagram or base line AF represents the time for one revolution, and is made equal to $FWr \times 2 \times 3.1416$.

Lay off on this base line equal divisions corresponding to those in the circle and erect ordinates equal to the several values of Fu computed by above-cited formula. These ordinates are the rates of displacement in cubic inches per second corresponding to the respective positions of the crank. This will give the curve ABC. The mean ordinate of the curve multiplied by abscissa t, the time through 180° will give the total displacement

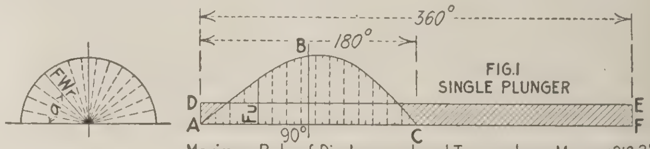

FIG.1 SINGLE PLUNGER

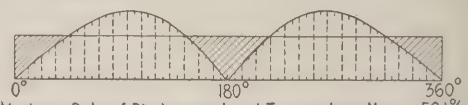
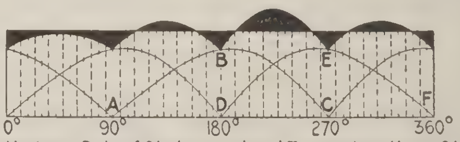
Maximum Rate of Displacement and Torque above Mean =218.2%
Minimum " " " " " below " =100.
Total Variation =318.2%

FIG.2 DOUBLE PLUNGER



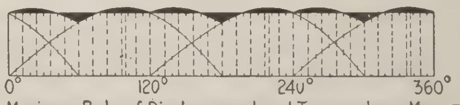
Maximum Rate of Displacement and Torque above Mean =59.1%
Minimum " " " " " below " =100.
Total Variation =159.1%

FIG.3 DUPLEX DOUBLE ACTING



Maximum Rate of Displacement and Torque above Mean=24.1%
Minimum " " " " " below " =21.5%
Total Variation =45.6%

FIG.4 TRIPLEX SINGLE ACTING



Maximum Rate of Displacement and Torque above Mean= 6.1%

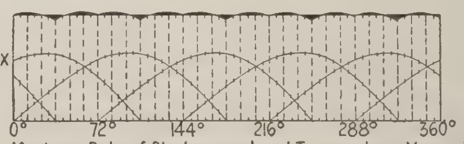
Total Variation =23. %

FIG.5 QUINTUPLEX SINGLE ACTING



Maximum Rate of Displacement and Torque above Mean= 1.8%
Minimum " " " " " below " =5.2%
Total Variation =7. %

DIAGRAMS SHOWING CRANK EFFORT AND DISCHARGE OF VARIOUS TYPES OF POWER-DRIVEN PUMPS for the discharge stroke. *A* to *C* is the discharge stroke and *C* to *F* the suction.

---

[*] Diagrams furnished through courtesy of Aldrich Pump Co., Allentown, Penn.

[†] 2218 Farmers Bank Building, Pittsburgh, Penn.

These diagrams illustrate also the tangential force or torque for every position of the crank. In this case the radius of the circle represents total load on the plunger and the ordinates the torque in pounds.

SUPERIMPOSED CURVES SHOW ACTION OF MULTI-PLUNGER PUMPS

For more than one plunger it is only a matter of locating the curves in the diagram as they occur in the crank circle. Since crank-pin velocity is constant and the plungers are equally spaced on the crank circle, the curves must be equally spaced on the diagram by

$$t = \frac{a}{360} T$$

Fig. 2 represents a single crank double plunger pump (one crank, two plungers). Fig. 3 represents a duplex double-acting pump (two cranks, four plungers).

The irregularity of pulsation in Fig. 3 is due to the fact that with the plunger on the forward stroke the displacement is greater through the last 90° than the first, since the maximum velocity occurs with the crank at 99° 29′ 43″ of the discharge stroke and area *CBD* is greater than *ABD*. When discharging on the return stroke the maximum velocity occurs when the crank pin reaches 80° 30′ 17″ of the discharge stroke and area *FEC* is less than *DEC*. Therefore the greatest areas, *CBD* and *DEC*, overlap between 180° and 270°, and the smaller areas, like *ABD* and *FEC*, overlap between 0° and 90°. The overlapping areas between 90° and 180° and between 270° and 360° are equal.

Fig. 4 represents a triplex single-acting pump (three cranks, three plungers). This figure holds true for a triplex double-acting pump, or sextuplex. The area of the diagram, however, would be twice as great. There is nothing to be gained by six cylinders as far as evenness of flow and torque on the shaft are concerned, as the cranks would be 60° apart, giving the same number of pulsations. This can readily be seen by filling in additional curves from 60 to 240, 180 to 360 and 300 to 60, noting that all the ordinates have just twice the value.

Fig. 5 represents a quintuplex single-acting pump (five cranks, five plungers).

In these diagrams the ratio of crank-circle radius to connecting-rod length is 1 to 6, and the ordinates, computed for every three degrees, give accurate values. The types of pumps for which these ratios have been determined cover only the outside packed plunger variety.

For piston types the variations are somewhat greater, due to the effective area of the piston being less on the return stroke on account of the piston rod.

Air chambers and spring alleviators are sometimes employed to reduce the fluctuations in discharge and flywheels to compensate the variations in torque. The diagram shows the results of the different types without these appurtenances, which may be considered but means for partly alleviating a condition determined by design.

Air chambers are ineffective unless they are amply large and kept charged. This is practicable in low pressures with the use of a small air compressor for charging and keeping the air vessel filled with air. Spring alleviators are used in the higher pressures, and the amount of fluctuation taken care of depends on the number of coils employed.

Flywheels are not the usual practice except in some single-crank double-acting pumps. The manufacturers seem to rely on the moving parts of the pump to overcome the variations in torque. Actually only a small part of this variation is compensated for by this means. While this unsteadiness of action is not so serious on small units, it nevertheless affects the efficiency and life of the machine. On pumps of large capacity and horsepower the excessive variation in the discharge line and torque on the shaft is of great importance and should receive first consideration. It should be apparent that the smoother the action of the pump, the more efficient it is, and less subject to excessive wear.

Of all the pumps illustrated the quintuplex and triplex single-acting machines show the best results. The quintuplex has very little variation in discharge and torque. With but one more plunger than the duplex double-acting it is more than 6½ times smoother in action. The triplex, with one less plunger than the duplex double-acting, has only half the amount of fluctuation.

The triplex and quintuplex types have quite an additional advantage in being single-acting, in which all loads are made to act in one direction. This is not the case in the duplex double-acting, nor in triplex double-acting machines. In the former, two plungers are on the discharge stroke when moving in opposite directions. The plunger loads act oppositely through a total of 180° of crank movement. The triplex double-acting pump has always two plungers moving one way and the other in an opposite direction when discharging. Those actions, which produce abnormal stresses in the shaft, bearings, frames, etc., of double-acting pumps, are not met with in triplex and quintuplex single-acting machines.

⁂

Coal-Mining Conditions in St. Etienne

Conditions in the coal-mining industries of the St. Etienne district of France, says Consul William H. Hunt in *Commerce Reports*, during the first 7 months of 1914 were normal, the quantity and value of the production being nearly equal to that for the same period in 1913.

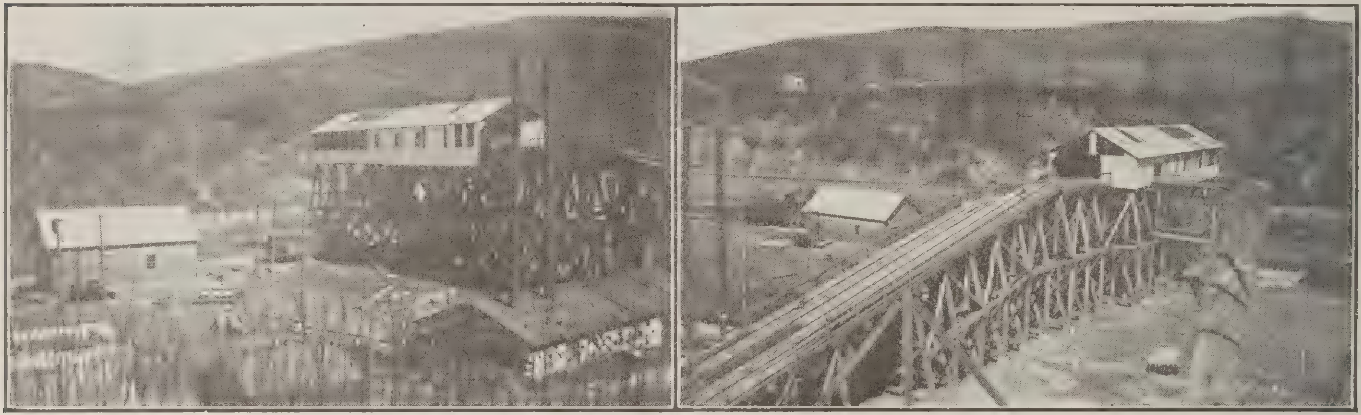
After the war began the military authorities granted all miners belonging to the territorial army a suspension from active military service, in order that the mines might not be shut down entirely by reason of the mobilization of the younger mine workers. The arrival, however, of a large number of Belgian and French miners, refugees, who formerly worked in the coal mines of Belgium and northern France, saved the situation; yet the output was far from normal. I am reliably informed that the quantity of coal produced in the Loire Basin from Aug. 1 to Dec. 31, 1914, shows a decrease of 50 per cent. in the output, compared with the statistics for the last five months of 1913.

The mining bureau of the Loire Department gives the total production of all kinds of coal in this region in 1914, in metric tons, as follows: Soft coal, 3,329,925; patent fuel (briquettes), 209,020; coke, 138,472; anthracite, 1012.

Application of Electric Power at the Soudan Mine

The Soudan mine of the Youghiogheny-Pittsburgh Coal Co., which recently began shipping coal, is one of the best-equipped mines in the country in which electrical power is employed.

The elimination of the boiler and generating plants usually found around mines generating their own power adds greatly to the appearance of the surface layout of this operation. Located in Washington County, on the Ellsworth branch of the Pennsylvania R.R., this mine will develop a large acreage of Pittsburgh coal at a proposed daily output of 2500 tons.



TWO VIEWS OF MINE TIPPLE AND POWER HOUSE AT THE SOUDAN MINE

The coal is reached by a concrete-lined double-track slope about 500 ft. long on a 20-per cent. pitch. The manway and airway are constructed in a two-compartment concrete-lined shaft, rectangular in section and with an 8-in. reinforced partition wall between the stair and airway compartments.

Ventilation is secured by means of a 9 ft. by 8 ft. 10 in. American Blower Co. Sirocco fan, set in a brick and concrete housing entirely of fireproof construction. The fan is belt-driven by a 175/50-hp. three-phase 2200-volt motor, controlled from the powerhouse.

SLOPE AND PORTAL TO MINE SHOWING SAFETY DOGS EVERY 20 FT.

The powerhouse is 45x30 ft., of fireproof construction, being built of hollow tile. It contains the motor-generator set, switchboard and haulage engine; it is also the charging station for miners' lamps. The motor-generator set furnishes 250-volt direct current for inside work. West Penn power is used exclusively at this plant, all motors being built for 2300-volt three-phase alternating current.

With this system the engineer controls all of the machinery outside of the mine from the powerhouse. As an extra precaution the motor driving the haulage is equipped with a remote-control circuit-breaker, from which wires are run and connected with small knife switches on the tipple and elsewhere along the haul. In cases of emergency the rope may be readily stopped, without resorting to the bell signal, by merely opening one of these switches.

The system of hauling coal to the surface is the one best-suited to the local conditions. The equipment embraces 2700 ft. of 1¼-in. endless plow-steel rope, to which the cars are attached by means of cast-steel grips. The rope extends back into the mine 300 ft., at which point are located the tail sheave and tension carriage. Safety dogs are placed every 20 ft. on the uphaul to hold the cars in case the grips should slip. The rope is driven by a 150-hp. 2200-volt three-phase induction motor.

A Frame Tipple Is Employed

The tipple is built of heavy frame construction from native lumber and consists of 12x12-in. white oak bents substantially braced. This building is equipped with two crossover dumps of latest design, and also the most improved screens and weigh pans. The slate is readily disposed of by means of a spur extending from the side of the tipple.

There are four loading tracks with crossovers to facilitate shifting cars. Each is of sufficient length to hold 60 cars.

Inside the mine, development work is being rapidly pushed forward, a 7½-ft. short-wall undercutter and a 7-ft. breast machine being successfully used on entry work while locomotives are employed exclusively for gathering.

In accordance with the directions of the owners to provide comfortable homes for the employees in a sanitary location, the site of the town contiguous to this mine is one of the prettiest in the state. Double frame houses of 10 rooms, with 6-ft. cellar, as well as small 3-room cottages of neat design for the use of smaller families have been built.

Each family has a large plot for gardening and vegetable raising.

A water system furnishing pure spring water for household use has been installed, while adequate fire protection is now being projected.

Synchronous Motors for Coal-Mine Operations

By C. A. Tupper*

SYNOPSIS—The practice of employing synchronous motors for driving coal-mine equipment where the load is constant, or nearly so, is growing. This is because they tend to correct the disadvantageous low power factor that usually prevails in an underloaded alternating-current distribution system.

In the electrification of coal mines and surface plants, one of the most notable of recent tendencies has been the action of some of the larger operators in adopting synchronous motor drive for compressors, pumps, fans and other machines or lines of shafting which require considerable power and are operated continuously at constant speed. The object is to take advantage of the characteristics of the synchronous motor in equalizing the power factor of an alternating-current distribution system.

To understand the significance of this, it will be well to consider what "power factor" means.

When an alternating current and its electromotive force or voltage are in the same phase, that is, rise and fall in strength exactly together, the power in the circuit is the product of the volts and the amperes. But when the current lags behind the electromotive force, as when flowing to underloaded induction motors or transformers, or when it leads the electromotive force, as in flowing to a second generator, the power in the circuit is less than the product of the amperes and the volts. Whether the current lags or leads, the actual power obtainable from the circuit will be equal to a certain definite percentage of the power that the circuit would represent were the current and electromotive force in phase. This percentage, called the "power factor" of the circuit, is thus the ratio between the true power and the normal rated power of the generators.

Output Depends on the Power Factor

To illustrate: If a generator is designed to deliver 1000 kw. of energy at unity power factor—such rating, however, being usually given in kilovolt-amperes to indicate the absence of any deduction for loss in power factor—at 85 per cent. power factor it is good for only 850 kw.; at 80 per cent., no more than 800 kw., etc.

Taken by itself, an incandescent lamp load gives a power factor of 90 to 95 per cent. Fully loaded static transformers and induction motors running near full load, either separately or in combination with a lamp circuit, give high-power factors. Arc lamps yield a power factor varying from 70 to 80 per cent. at full load. Unloaded or lightly loaded transformers and motors of the induction type show, however, a low power factor on the average, seldom better than 70 per cent.

As the load is reduced, the power factor decreases rapidly. Lightly loaded transformers have an extremely low power factor.

Synchronous motors, however, will operate at any desired power factor, as this is dependent on their field current and is, therefore, under control. Varying the strength of the direct current exciting the field magnets, which can readily be done by an attendant while a machine is running, will cause any desired variation in the power factor.

In this manner it can not only be raised to any degree, but can be made to neutralize the effect on the entire system of other apparatus having a lower power factor, thus bringing the value in the transmission and distributing lines and on the generating plant, i.e., for the complete circuit, up to approximately 100 per cent., irrespective of other apparatus.

The synchronous motor can be constructed to operate on single phase or polyphase circuits, with, of course, the proper winding in each case. When its fields are fully excited, and it has been brought up to its rated speed, which can be done by a small induction or direct-current motor mounted on the same shaft, or by a special winding on the rotor, as explained farther on, current can be thrown on from the main supply as soon as synchronism is indicated by lamps or by a suitable instrument on the starting panel. Then, provided the speed of the main generating unit or units is properly regulated, this type of motor will run at constant speed from no load up to a very heavy overload.

The installation and care of alternating-current motors require considerably more attention for the synchronous than for the induction type; and anyone contemplating the use of the former, or who is not now getting satisfactory service from such machines already installed, will do well to consider these conditions.

In the first place, a synchronous motor should be installed in a dry room or chamber, where it will not be exposed to more than atmospheric moisture; it must also be protected from flying coal or other dust, from inflammable gases or combustible material. The location ought, also, to be cool and well ventilated, as any increase in the temperature of the room is added to that of the motor.

If the coils of the motor have been exposed to a low temperature before the machine is set up, their coverings should not be removed until they have had time to attain a temperature approximating that of the room. Otherwise, when opened, they will "sweat," with consequent unfavorable effect on the insulation.

Foundations Should Be Heavy

The foundation should be heavy enough to secure freedom from vibration, and in constructing it provision must be made for foundation bolts to hold the base or adjustable slide rails of the machine. Motors of, say 100 hp. and under, can be set on heavy timber supports; but a concrete or masonry foundation is to be recommended wherever possible.

Where a large synchronous motor is direct connected on the same shaft with the machine to be driven, as in the case of compressors of considerable capacity like those illustrated herewith, procedure resembles that of the installation of engine-driven generator units. The motor yoke usually rests on sole plates secured to the foundation. These sole plates, however, are frequently made in two parts, the lower one being bolted down while the upper is adjustable with shims to facilitate centering the stator with respect to the rotor. The smaller belted motors are usually shipped completely assembled, with the stator yoke and bearings fastened to the base or fitted with slide rails.

---

*Cleveland, Ohio.

The best plan for handling the parts and putting them in position will depend largely upon the size of the motor, the location and the handling facilities available. If a crane spans the room the work is comparatively easy; but in the absence of this a horse or tripod made of heavy timbers should be provided, made sufficiently strong and well secured at the base to hoist the motor parts into place by means of a chain block.

After the machine has been carefully erected and all of the connections have been made and tested by the usual methods, both sets of windings should be dried out by slow operation; then it is ready to place in regular service, provided that the machine to be driven is in running order also.

Assuming that the synchronous machine has an auxiliary motor for starting, preferably of the induction type, the procedure will be as follows:

See that the switches on the supply circuit are open; and, if the current is taken through a step-down transformer, close the oil circuit breaker on the high-tension side of the latter; also, make connection to the source of excitation with the field rheostat all in, and insert the plug for the direct-current voltmeter. Then put in the synchronizing plug. Start the synchronous motor by closing the starting motor switch. Build up exciter voltage to normal, adjusting the exciter rheostat and gradually cutting out resistance from the field until the proper amount is reached.

Meanwhile, the auxiliary motor has been bringing the synchronous motor to slightly more than synchronous speed, as compared with the generator furnishing the supply; so the synchronous motor is slowed down to that speed by the closing of the switch controlling the synchronizing resistance. If the speed becomes too low, the latter switch is opened and closed again until the speed is right.

When the synchroscope or the lamps commonly used for this purpose indicate synchronism, current from the main supply circuit is thrown in and the starting motor and synchronizing resistance cut out. The field rheostat is then adjusted, as described in the early part of this article, so as to have the most favorable effect on the power factor. The apparatus to be driven is started up under friction load only when practicable, or by means of a belt shifter, tight and loose pulleys, friction clutch or barring device, as may be required.

SELF-STARTING SYNCHRONOUS MOTORS HAVE LOW STARTING TORQUE

Self-starting synchronous motors, made in the smaller sizes, are provided with a cage winding on the rotating element similar to the rotor winding of the ordinary induction motor. This serves as an induction-motor secondary winding during starting.

A self-starting synchronous motor is usually designed to develop a maximum torque at starting equal to about 30 per cent. of that generated under normal running conditions and to pull into synchronism at approximately 15 per cent. of running torque. Consequently, this type of motor is only adaptable in cases where easy starting requirements prevail, such as driving direct-current generators, pumps that are started up with a bypass, short lines of unloaded shafting, etc.

The method of putting a self-starting synchronous motor in operation is similar to that used with a standard squirrel-cage induction motor; that is, by applying reduced alternating-current voltage directly to the armature winding. Ordinarily only one starting voltage—anywhere from one-quarter to one-half of normal—is required, and this is obtained through an auto-transformer with suitable tap. In applying the reduced voltage, an auto-starter switch serving as a combined starting and line switch is used.

Owing to the fact that during starting a dangerous voltage would be induced in the field winding if this circuit were left open, it is necessary to use a double-throw switch in order to close the field circuit through the field rheostat until operating conditions are obtained. This limits the current which would otherwise decrease the starting torque.

HOW TO START A SYNCHRONOUS MOTOR

The details of starting are as follows: After first making sure that all switches are open, with all the rheostat resistance in, close the double-throw field switch above mentioned, and make the connection to the main supply circuit; then bring the auto-starter switch up to starting position. The motor should speed up to synchronism in a minute or less. When this has been accomplished, as indicated by the synchroscope or lamps used in its place, throw the field switch over with all rheostat resistance still in; then put the auto-starter switch over to running position, applying to the motor the full line voltage, and finally adjust the field rheostat for minimum armature current and the best effect on the power factor of the system.

Regulation of the exciter voltage will be as above described for a machine started by an auxiliary motor, the connection being made through the double-throw switch in the field circuit. If, however, the exciter is mounted directly on the shaft of the synchronous motor, the field discharge switch can be single-throw and the field connected directly through the exciter armature with the rheostat in the circuit. The field is thus short-circuited at standstill and is gradually charged as speed increases.

In general it may be said that the same care should be given a synchronous motor as an alternating-current generator of the same size and characteristics. And if this is done the service which it will render and the favorable effect which it will exert on the power factor of the system will well repay the attention given.

⁂

Explosives Should Be Handled with great care, and in this direction it may be useful to keep in mind the eight causes of accidents when shotfiring quoted by Professor Courtenay de Kalb: (1) A hole missing fire. Driving a wedge near the hole two days later has been known to explode the charge. (2) Using a short fuse to hasten explosion has exploded the charge before the workmen could retreat. (3) Smoking a pipe while charging a hole. (4) Loading a hole with the aid of an iron stemmer. (5) Firing a charge in a hole to clear it of water, and immediately reloading. (6) Ramming a charge in a hole with an iron crowbar; also tamping a charge with an iron bar. (7) Drilling out a misfire shot with a blunt drill. (8) Forcing a cartridge into too small a hole.

W. B. Owen's Reminiscences

W. B. Owen, of Dorranceton, near Scranton, Penn., who was formerly foreman of the Pettebone Colliery of the Delaware, Lackawanna & Western R.R. Co.'s coal department (now the D., L. & W. Coal Co.), recently wrote the following reminiscent letter to the Wilkes-Barre *Daily News*:

As the bell on the carpenter shop rang for work on the morning of June 1, 1859, I entered the primary department in Bellevue breaker to begin my education in the "Black Art." Sitting in my library today, in a reminiscent mood, with my diploma in my hand, my mind reverts to that momentous day when, with aching back and bleeding fingers, I arose from the stove-coal chute and with jubilant spirits betook myself home, for on that day of 10 hr. I had earned just 17c. For my first working month of 26 days I received the sum of $4.42. This rate of wages continued until Jan. 1, 1860, when for good deportment I was advanced to 28c. per day.

When 200 Tons Was a Big Day

The working day was divided into quarters. If the breaker started up and worked only 10 or 15 min. the men were paid for one quarter of a day. Full coal for the miners meant a full day for everybody. Two hundred cars of coal hoisted was considered a "big day."

Egg coal was used exclusively for generating steam. Everything under chestnut size was sent to the culm bank as refuse. It is safe to say that in those days some of the culm banks contained a greater percentage of coal than some of the veins now being worked.

The system of condemning coal for rock and slate was in an embryonic state. If a car of coal contained from 10 to 20 per cent. of rock (the quantity was always estimated) the top of the car was picked off and the consumer was allowed to clean the rest. The iniquities of the coal inspector had not yet been conceived. There were no modern "cost sheets" to give the poor bosses nights of wakefulness trying to frame explanations that do not always explain. This cost sheet of the coal-mining department is the greatest instrument ever devised by the company to keep down the cost of mining coal.

In those days lard oil, and later whale oil, was used for lighting purposes in the mines, and this was given gratis to the men and boys. There was no restriction on the use of timber and supplies, yet they were used with greater economy than today. The total production of coal from the company's mines in 1859 was 336,082 tons, which is less than one-fourth of the present annual output of the Woodward or Truesdale collieries alone.

Happy the Man Who Made a Dollar a Day

Following is the approximate rate of wages paid at that time: Hoisting engineers, $1 per day; firemen, 68c.; laborers, 50c.; slate-pickers, 17c. to 25c.; door boys, 25c.; single drivers, 48c.; team drivers, 62c.; driver bosses, $1.35. Yet the days of these low wages were days of peace, happiness and contentment.

There was only a slight increase in the wages paid until 1865, when the war closed and the demand for coal became so great that wages were increased from 50 to 100 per cent. Miners were paid $2 per car and got all the cars they could load. It was not unusual for miners to receive from $200 to $500 per month. Drivers who formerly received 65c. per day were raised to $2.20.

The news of this prosperity was carried to foreign shores and received an eager hearing from the hungering hordes of Europe, and they swarmed into the coal fields of Pennsylvania. When both the demand for coal and its price were reduced, wages were also lowered. Then the seed of discontent began to germinate; unions were formed and enmity sprang up in the hearts of the men. The days of unrest were begun, and they will never cease as long as coal is mined.

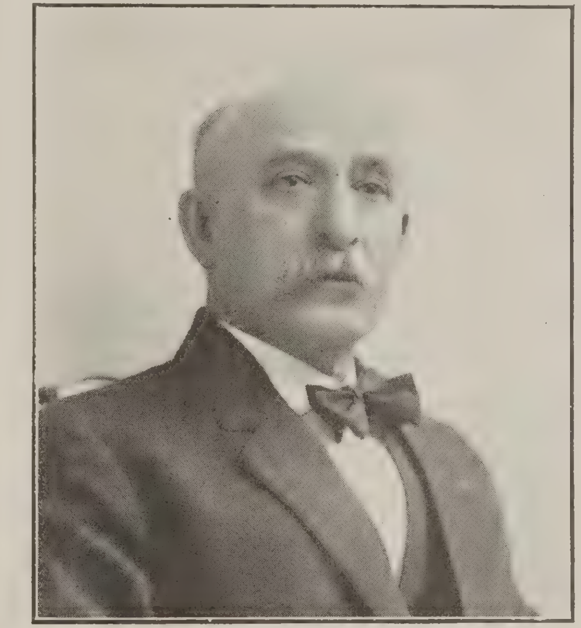
In 1872 the company was obliged to sue for relief in order to avoid failure. Employees in well-paid positions, such as engineers, conductors, officials, and in fact all the employees except miners and day laborers, were asked to submit to a reduction in wages, with the promise that when the stock again went up the wages would also be increased. The employees consented, but the agreement was never kept. If the same efforts to promote economy that are so strenuously urged today had been practiced at that time conditions would have been different.

With modern methods of mining the percentage of accidents, both fatal and nonfatal, is higher now than in those early days. Notwithstanding the laws enacted to protect men and boys and the safeguards thrown about employees and despite the keen competition among the companies to provide the greatest protection and the most efficient "first aid to the injured," the number of mine accidents is appalling.

Accidents Were Usually Charged to Carelessness

In the early days a fatal accident aroused universal sympathy; a collection was taken at the mines for the poor widow and the neighbors took care of her and the orphans. An appeal was seldom made to the company except for coal. And why? Because it was generally understood that the accident was the man's own fault. To what, then, can we attribute the enormous number of accidents of the present day?

With all the "safety first' signals and the warnings on every side, men and boys will rush headlong into danger with utter disregard for their personal safety. Liability and compensation acts are partly responsible for this condition. Men do not seem to hold their personal safety in such high regard as they did formerly.



W. B. OWEN

Fear of Heaven's displeasure kept men from danger then; now they do not even think of Heaven. In the early days men here, as in Wales, used to hold a prayer meeting at the foot of the shafts before entering their chambers. Today the prayerless man will enter his chamber disregarding all civil and moral laws, will deliberately return in mad haste to a delayed blast and will receive injuries. He will then establish a residence in an adjoining state, go before a jury that is ignorant of conditions in the mining districts, and will obtain a verdict of $50,000 or so. In the old days a gift of $50 and a scolding from his boss and the neighbors would be considered sufficient compensation.

After an unbroken service to the "D., L. and W. company" of 56 consecutive years, during which time I never received an injury or earned a cent from any other employer, and with boundless gratitude to Almighty God, I bid farewell to my "alma mater."

Seventeen Cents per Day and Upward

Mr. Owen's first day's work described in his reminiscences was performed when he was only 9 years old. He is now 65 and the company has pensioned him. He has been a slate-picker at 17c. per day, a driver boy at 28c., a driver at 42c., a team driver at 57c. He has bailed water and cleaned track for 70c. a day, run a plane for 87c., been outside barn boss at $1 per day, blacksmith at $1.35, and weighmaster at $1.64 per day. In 1875 he was made assistant foreman. As can be seen by his letter, he is remarkably well-educated for a man having such limited opportunities, his hobby being astronomy. It is not necessary to say that Mr. Owen has hosts of friends. His reminiscences are calculated to make every reader the friend of the genial Welshman.

Rebuilding an Unprofitable Mine

SYNOPSIS—A review of the conditions found in an unprofitable mine where the equipment was inefficient. The detailed steps that were employed in rebuilding the plant, and the results that were afterward obtained.

The mine here described is one owned and operated by a large company and has been in operation for about 20 years, but on account of the ambitious desire of several successive superintendents to make a record for themselves by producing coal at a low cost, the equipment not only had been neglected, but had not been increased by the management as the mine grew in size.

In the mine, the workings had become widely scattered. There were three divisions, any one of which if properly handled would have produced the required output of 1500 tons per day. The method of working was careless, and when one working place became bad, instead of timbering and making it safe, it was temporarily abandoned and another place substituted.

This in time caused the rib work to become very irregular, and as all rib work is more or less squeezed because of the weight, this lack of systematic mining caused the fracture line to be in such a condition that it was practically impossible to maintain a good system of ventilation. As there was more or less gas in the gob at times, mining work became hazardous, for it was quite impossible to remove the gas on account of the irregular fracture line.

By way of explanation, mining was on the room-and-pillar system. Rooms were 12 ft. by 300 ft., driven on the face of the coal off butt headings which were about 1200 ft. long. These rooms were driven sometimes 80 ft. centers and very frequently 40 ft. Often they were allowed to remain four or five months before the rib coal was extracted, and when this was done, instead of taking ribs out in uniform line, it often happened that four or five ribs were allowed to stand until they were as much as 150 ft. behind the fracture line. These workings were so extensive that they extended over a territory of about 4 sq.mi., so it was not unnatural that three sections out of fifteen were in a bad condition.

Economical Mining Was Impossible

The mining had been conducted in such a way that there was three times as much track as would have been required had the mine work been concentrated. The greater part of the rails in the track had been carelessly laid, there were not sufficient ties and frequently no splice bars, and nearly all the track was in a miserable condition.

The mine, on account of lack of thought on the part of the operators, had been allowed to grow in size and output without any corresponding increases in mine equipment. The chief reason for this policy was a matter of economy. The mine equipment in the way of cars and motors was little more than half what it should have been for economic operation. Thus men were not furnished as many cars as they could load. The poor condition of the cars caused the loss of coal and the sifting of dust on the track, causing much trouble.

Bad car axles and wheels as well as a bad practice of using sprags caused many wrecks, stopping empties as well as loads. There was not a sufficient number of motors to allow time for thorough and systematic repair work; consequently much time was lost in temporary emergency repairs. The grades were 4 and 5 per cent., and the use of sprags on only one side permitted the use of sand on only one rail; thus the motors were worked on one side. In keeping with the rest of the bad conditions, the drainage had been neglected and water on the haulage-roads caused the motor to slip and greatly reduced its capacity.

Surface Conditions Just as Bad

Outside of the mine, the machinery and equipment were in about the same condition. The shaft was wet, making it disagreeable for the men to travel on the cages. Also it was difficult to keep the hoisting ropes lubricated, and they had to be changed before they had been used more than one-third of the time they should serve under normal conditions.

The repair shop was divided into three sections or rooms. The windows were small and always dirty, and the electric lamps were not placed so as to give the men the necessary light.

The miners' houses were as poorly maintained as the mine. There were leaky roofs, bad floors, loose windows and many other undesirable conditions in the yards and streets. Such a state as was found everywhere caused much dissatisfaction among the employees and resulted in bringing in an inefficient, unruly class of miners. The foremen as well as the men were given to drinking.

The first important change made after the new superintendent went on the job was the gradual replacing of the foremen of the different branches of the organization with men who would think for themselves and who were total abstainers, for it was the opinion of the new superintendent that one who drinks in even a moderate degree is not a proper person to handle men in a hazardous occupation.

The next important step was to get the mine-car equipment repaired and increased to a point where it would handle the coal without delays and increase the production per man. Time was counted as money, and by eliminating the delays, the loss of coal and the wrecks, the efficiency of the men was increased about 30 per cent.

Work was begun on the haulage-roads immediately. They were relaid with heavier iron, and good ditches were made to prevent the flooding of the tracks. There was not an appropriation for a new motor, so the best had to be made of a bad job. The well-repaired cars, dry track and new rails all helped to relieve the strain and troubles of the motors. Each night the electric locomotives were taken to the shed and turned over to repairmen, who continued this work of rebuilding for six months, doing only such jobs each night as might be finished in time for the motors to be used in the morning. Thus little time was lost during the day in repairing the motors. Efficiency in two months was 25 per cent., and in six months, 50 per cent.

Mine work was concentrated, two sections being used, while the third was abandoned. The places which had been left idle on account of gas were carefully inspected and worked; the rib work was straightened, thereby simplifying the ventilation until in eight or nine months gas in any working place was an unknown thing. The cost of ventilation was reduced 50 per cent. in 10 months.

THE MINE WAS AN ISOLATED ONE

The mine was located 1½ mi. from the interurban line and 5 mi. from the nearest city. As there was no conveyance from the car line to the coal camp, the miners were not as eager to select this village as a home as some other places nearer the city. Considering the condition of the entire plant before the reorganization, one can readily see that an undesirable class of miners predominated. After the mine had been put in a better working condition, the worst men were discharged as fast as better men could be found to take their places. As the more industrious men took the places of the hard drinkers, there was less laying off after paydays, and fewer miners took advantage of the numerous holidays in their church life.

The hoisting shaft was made dry by means of a water ring excavated in the strata back of the timbers and made water-tight by concrete. An iron pipe was used to convey the water to the bottom of the shaft. Thus the life of the hoisting rope was prolonged to at least three years.

The repair shop was cleared and remodeled, making one long workroom. The windows were made twice as wide and kept clean. Electric lights were put at places where they would give the best service.

The miner's houses were carefully inspected, and all necessary repairs were made as soon as possible. Porches were placed at the front and back of the houses, and the cellars were made dry. The yards were inclosed with fences, and miners were told to grow something green, if only weeds. People were encouraged to make gardens, and the number of hydrants was increased so that water-carrying was no great task. The streets were cleaned, and concrete drains were provided to carry away the water. Garbage cans were placed in the alleys and periodically emptied.

While only a few years ago this plant was considered one of the most expensive in operation, today it numbers among the cheapest in the cost of producing coal and has a reputation of being one of the best mines in the region in which it is located. It now has a force of strong bosses, some of whom are the best-paid men in the region.

⁂

New Zealand Government Mines

The government-operated coal mines of New Zealand, says *Commerce Reports,* produced 189,495 tons of coal during 1914 out of a total production of nearly 2,000,000 tons. This coal is placed on the market in competition with the privately mined and imported coals and is of a fair quality. The coal production of New Zealand has increased from 719,546 tons in 1894 to 1,888,005 tons for 1913.

Extracts from a Superintendent's Diary

A college mate of mine sent me a newspaper clipping today containing a poem describing the life of a miner as a poet imagined it must be. About every third line contained the word "dark," and the last line carried a desponding appeal for "light." It was more than an appeal, it was a prayer in which the miner begs that the horror of the dark may be relieved by a few stars. The heavens are so full of stars, why couldn't just a few be spared to overcome the impenetrable inky blackness of the mines? What fascinating imagination! Surely, no one but a poet could have conceived that.

And my friend wasn't joking either; he was just as much in earnest as the poet was. He sent it to me as a literary gem. The receipt of the poem started a train of recollections. Ever since I entered the mining game I have received letters from friends wanting to know how human beings can accustom themselves to "impenetrable darkness." Yes, every last one of them has put in that word "impenetrable." Undoubtedly, some poet used the word in a poem that has traveled far and wide, although it has not been my good fortune to run across it; and the phrase was used so effectively that now the adjective "impenetrable" immediately suggests mines to them whenever they see it in print.

I am wondering what will happen to my correspondence when the same city friends read this other poem with the suggestion about the stars? If the bare mention of impenetrable darkness has made such an impression, what will the combination of stars and impenetrable darkness do to their imaginations and to my mail?

Last summer while in New York I made a special point of taking several of those friends around to hotel lobbies that depended entirely upon artificial light, and in addition to artificial light required large force fans to maintain artificial ventilation. I was very particular to pick out hotels where the ventilating problem had been given careful consideration, and in consequence were the most comfortable places to be found during the hottest hours of the day.

Being a stranger in the city, I was privileged to ask questions, and I always wound up by asking for information as to the effect of artificial light and ventilation on the death rate of hotel clerks. My hosts generally took a second look at me to see whether I was in earnest, and satisfying themselves on that score, they suggested that they were not familiar with the statistics, but if their business permitted they would be willing to take chances under similar surroundings.

That gave me my opportunity, and I never failed to rub it in good and strong. I contrasted the miner working in the quiet of his room, surrounded by cool fresh air and a single "buddie," with the laborer working in the well-lighted mill building, but with all of the din and confusion, to say nothing of the customary poor ventilation. If circumstances had permitted my giving all of my friends similar treatment, I am conceited enough to believe that every one of them who saw the paper with the poet's fancy about the stars in the impenetrable darkness would cut it out and mail it to me with some such remark written across it as: "What do you think of that for pure bunk?"

Illinois Miners' and Mechanics' Institutes Suspended

Special Correspondence

The work of the Illinois Miners' and Mechanics' Institutes, for the coming two years, will be at a standstill. This is the result of Governor Dunne having vetoed the funds necessary for the work of the institutes at the last hour of the last day he occupied the office as the head of the State Government.

The House and Senate agreed on an increased appropriation of $31,600 for the coming two years, but the Governor's veto nullified their efforts. This act of the Governor in passing out of office has been generally regretted throughout the state. The common expression heard is that it is a great pity that the work is to be temporarily abandoned. All agree that the Illinois Miners' and Mechanics' Institutes, as an organization, was filling a great need in all industries.

The first center of instruction was established at Belleville on Mar. 18, 1914. From that time to Oct. 8, 12 other centers were established, in each of which a complete two-year mining course had been inaugurated. The average attendance at the different centers to Jan. 1, 1915, was 26 students. In that time 464 sessions had been held, and the work of establishing other centers had progressed rapidly.

The work of the institutes at the different centers, was ably assisted by the local school teachers, who gave their services free in teaching mathematics (in some places both elementary and advanced) and English for foreigners. This was notably the case at Collinsville, where C. H. Dorris, Superintendent of Education; A. E. Arendt, Principal of Collinsville Township High School, and the Misses Emma Harris and Melitta Harris, teachers in the Township High School, all gave their services free in teaching the above subjects. In addition to these, other teachers coöperating in the work of the institutes are the following: Kurt Busiek and H. G. Schmidt, Belleville; H. L. Kell, Benton; C. A. Chatten and R. G. Crisenberry, Carterville; W. H. Creed, Caseyville; George W. Solomon, Gillespie; Clarence Bonnell, Harrisburg; H. L. Heath, Ivan A. Palmer and T. H. Schutte, Herrin, and M. B. Coker, Troy.

On Apr. 6, 1914, less than seven weeks after the establishment of the first instruction center, a short six-weeks' course was given at the University of Illinois under the auspices of the institutes. This six weeks' course included the same subjects taught in the full two-year course. There were 33 students enrolled in this course, of whom four went through the entire course, while the others took special subjects. The same short course was held this year, June 6 to July 16, and 24 mine employees completed the whole six weeks of the course at the university.

In this connection, one has only to consider the scarcity of work at the mines during the past winter and the necessary expenses to each student for railroad fare and board, which may be roughly estimated at $50 for the six weeks, to understand that the Illinois Miners' and Mechanics' Institutes supplied a great need. If the work had been continued, it is probable that the short course for next year would have been divided into two or more classes held at the same time. It may be added that the men who attended the short course at the university were nearly all from centers where the two-year course was inaugurated.

It is to be deeply regretted that educational work of such a wide range and which was becoming firmly established throughout the state should be cut short by political intrigue. In every center there were found students who were exceedingly anxious to get an education. They were men who in their younger days had neglected the opportunities for education and others who since leaving school had let slip what they had learned. These all now realized the value of education in their daily work and were anxious to retrieve the time they had lost.

In the report for 1914, mention is made of the names of 58 men who attended every meeting of the institutes' courses in which they were enrolled. It is to be hoped that the enforced discontinuance of the regular work of the institutes will not discourage the teachers who volunteered their services so generously last winter and that much of the instruction work will be continued until the State of Illinois secures a governor who will be willing and able to befriend the miners and other industrial workers in their efforts to make themselves more proficient.

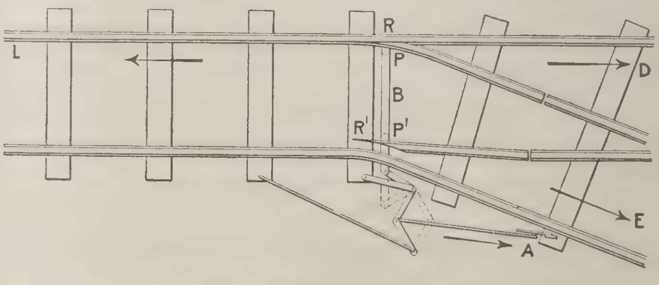
In closing permit me to say that it is a poor commentary on democratic rule and administration in the State of Illinois that the paltry sum of $31,600 appeared too large to be devoted to the work of instructing 80,000 miners in the state during the next two years. Such a proceeding surely manifests a penny-wise-and-pound-foolish system of economy. The miners of Illinois will certainly protest the action of their Governor, and two years hence will make their voice heard in the Legislature by the election of efficient state officers. In the meantime let us hope for greater enlightenment and a greater appreciation, on the part of the executive, of what is needed for the progress of the industrial workers throughout the state.

An Automatic Switch

By W. G. Burroughs*

The automatic switch here described is being used successfully on the trestle to the tipple and at all motor passways inside and outside of the Black Diamond coal mine, Berne Township, Athens County, Ohio.

The automatic switch which is shown in the illustration is that used on the trestle to the tipple. In the figure, the switch is set so that the main track *L* up which the loaded cars come from the mine, is connected with the track *E* on which the empty cars stand after being dumped. The switch point *P* is in contact with the rail *R*, and the switch point *P′* is separated from the rail *R′*. The switch points *P* and *P′* are fastened to the steel bar



A SIMPLE AND PRACTICAL AUTOMATIC SWITCH

---

*Mt. Hope, N. Y

B, which in turn connects with the system of levers as shown in the diagram.

Each electric mine locomotive has a steel arm projecting on the right side near its forward end. The loaded trip coming from the mine nears the switch, which it will be remembered is set to connect the main track L with the empty track E. The man operating the locomotive uncouples the loaded cars from the locomotive just before reaching the switch points P and P′. The locomotive passes onto the sidetrack E, and just as its entire length is on this track, the steel arm on the locomotive's side strikes the lever arm A, which through the system of levers and the bar B, shown in the figure, throws the switch points. The switchpoint P moving away from the rail R and the switch point P' moving against rail R' thus connect the main track L with the track D, which leads to the dump on the tipple platform, allowing the loaded trip to proceed onto track D and to the dump. The switch points are now left connecting the tracks L and D.

The loaded cars are discharged on a crossover dump and by gravity are switched onto track E at the right and lower than the main track LD. Here the empty cars are coupled together, and the locomotive is attached. They then start back for the mine, moving along the track E. As the locomotive nears the switch points, its weight forces the latch back into its initial position, connecting tracks E and L. The locomotive and empty cars pass onto track L and proceed to the mine. The switch is left connecting tracks L and E, and ready for the operation to be repeated.

T. L. Smith Co. Buys Excavator and Loader Rights

The T. L. Smith Co. announces that it has purchased the exclusive manufacturing and selling rights of the Albrecht excavator and loader and is in a position to make prompt shipment of machines.

For over five years the inventor of this machine, John H. Albrecht, has tried to market his device. A number of machines were sold and are being successfully used in different parts of the United States. Lack of capital, however, prevented the successful development of the business. Realizing the immense field in which this machine could be used to advantage, the T. L. Smith Co. took over the entire business of the Albrecht Excavator Co.

THE ALBRECHT EXCAVATOR AND LOADER

The Albrecht excavator and loader is well described by a man prominent in engineering circles: "This machine is halfway between a hand shovel and a steam shovel and will do the work of both." Only two men are required to operate the equipment—one to handle the scraper and one to run the machine. A 12-hp. horizontal gas engine of the heavy-duty type provides ample power to dig and load 20 cu.yd. of material per hour. This device will dig at a distance of 100 ft. from the machine and at any desired depth for ordinary excavations at the rate of about one round trip per minute. This loader will load as fast as 10 men. It will dig at any point either above or below its level and over a big area.

The Albrecht excavator and loader can be used for excavating for heavy foundations, basements or drainage ditches, for back filling, for loading sand, gravel, coal or coke and other similar materials from a stockpile.

Additional data and information can be secured by writing to the T. L. Smith Co., 1110-A Thirty-Second St., Milwaukee, Wis.

Testing the Efficiency of Safety Catches on Cages

Among the many precautions taken to safeguard the lives of the anthracite mine workers of Pennsylvania is the testing at least once a month of the safety catches on the elevators, or mine cages, used in shafts. These tests are now a legal requirement, but they were originally instituted by the operators.

The test consists of dropping the cage, fully loaded with coal, to see that its safety catches are in working order and capable of preventing a fall in case the rope should part. For carrying out these "drop tests" a special release hook coupled to the end of the hoisting rope is provided. When the trigger of the release hook is pulled, the cage depends on nothing but the safety catches, but its fall is stopped within a few inches. The powerful catches act promptly and grip or bite into the guides tighter and tighter until the descent is stopped.

Naturally no men are allowed on the cage during the tests, but the loaded cage itself weighs about three tons, and this great weight is all exerted in making the safety catches grip the guides. The tests are always witnessed by responsible officials of the coal companies, and reports of the results are submitted to a state mine inspector.

Coal-Mine Ventilation

The Sept. 4 issue of *Coal Age* will be devoted to the subject of mine ventilation, and we earnestly invite all our readers to contribute articles for publication in this special issue. We particularly desire detailed descriptions of new mine-ventilating plants, and we will be pleased to publish the results of tests on fans or other ventilating equipment. Articles accepted and published are paid for at a liberal rate.

The Labor Situation

SYNOPSIS—The miners in Ohio are suffering from slow time, idle mines and strikes. Other work is being offered them in Cleveland, Ohio, and mining work in Pennsylvania and Kentucky. The railroads blame the miners for wanting an undue wage, and the miners blame the railroads for charging undue rates.

The poverty among the Ohio miners is increasing. The resumption of the Blaine mine of the Lorain Coal & Dock Co. on July 26 pending the installation of mine scales was more than balanced by the shutting down of the mines of the Sunday Creek Co., No. 266 at Hollister and No. 254 at Jacksonville. In the first of these mines 400 employees find work, and in the other two 500 and 300 respectively are laid off. Only one mine of the Sunday Creek Co., No. 268 at Rendville, is still in operation and now the Blaine mine is again on strike.

The citizens of Ohio are quite generally aroused and are giving liberally. Columbus, Cleveland, Cincinnati and Piqua have been extremely generous. Carloads of food are arriving at the mines and are being distributed by the National Guard.

On Aug. 4 work for 153 men from Glouster, Nelsonville and Chauncey in the Hocking Valley district was provided in various Cleveland, Ohio, plants. The men were brought by a special train to that city, being conducted by J. M. Roan, the "Ohio mining inspector," and lodged in the armory of the Fifth Regiment of the Ohio National Guard, receiving their supper and breakfast at the cost of the militia. In the morning they were conducted to their work by Boy Scouts.

Work Available in Parts of Western Pennsylvania, Kentucky and West Virginia

The Republic Iron & Steel Co. of Youngstown, Ohio, has offered to give work to 150 men in its mines in Pennsylvania and is paying the transportation of the men applying for this work. W. P. Lear, representing the Pond Creek Coal Co., of Stone, Ky., has also offered to give work to 100 miners who are out of employment. Apparently the men did not want to work in nonunion mines and refused to accept work at Stone.

Mr. Lear said his men averaged a little more than $3 per day and that 55c. was paid for room work and 60c. per ton for entry work. Every man can get all the cars he can load. The company was willing to pay the transportation charges of the men and their families. A meeting was held at Hollister, near Glouster, at which about 125 men were present. Some seemed inclined to accept the offer and doubted if the union was worth the sacrifices demanded, but these men were not in the majority and allowed themselves to be whipped into line.

A coal company in Fayette County, W. Va., has sent a call to the distributing branch of the United States immigration service, asking for 1000 miners and promising good wages and steady work. It has been suggested that the recruiting be done in Ohio. Obviously there is need, as often happens, for a redistribution of labor in the coal industry, though much of the trouble in Ohio is due to ill-regulated wage rates and railroad rates and only a part to the quality of the coal.

Much has been said about an unjust discrimination against Ohio coal. As a matter of fact, the fuel which Ohio produces is not as good as that from West Virginia, but that is no reason why it should not be used in Ohio to the exclusion of other coal, if wage scales were kept to a normal level and railroad rates were maintained on the same low ton-mile basis as in adjoining states where the transportation companies are faced with greater engineering difficulties in construction, maintenance and operation. Nor is it reasonable that coal outside Ohio should pass over the rails in that state at a lower mileage rate than Ohio coal. Little will be done by using stickers reading, "Buy Ohio Coal." The economic interest will and should always overcome mere sentiment.

However, it is apparently not true that the Ohio miners are starving, but it is certain that their conditions are severely straitened. During the past week bulletins have been posted in Athens, Nelsonville, Wellston and Jackson in the Hocking Valley district calling for 100 men to work on the Chesapeake & Ohio Ry. extension near Portsmouth, Ohio, for wages ranging from $1.65 to $2 per day. Yet the only man who reported for work was drunk when he applied.

A number of miners employed at the Blaine mine of the Lorain Coal & Dock Co. in Belmont County struck Aug. 7 for the second time in 30 days. The men demanded that the company allow them two checkweighmen, which was refused. By the terms of the settlement of the wage scale made about two months ago, when the 14-months' strike was brought to a close, the strikers will be compelled to pay a dollar a day each as a fine if the strike is contrary to the agreement. The contract provides that a strike cannot be called unless the operators fail to pay wages when due and cannot give a satisfactory explanation.

Coal Operators Will not Join with Railroads

The railroads have asked "that a commission of Ohio coal operators join with a committee of the railroads in that state in an informal conference with the Interstate Commerce Commission to secure, if possible, their consent to a general inquiry on their own initiative into the conditions in Ohio, West Virginia and Pennsylvania for the purpose of outlining the differentials to competing markets in the West, North and Northwest that should apply from the competitive fields of Ohio, West Virginia, Kentucky and Pennsylvania, such action to be without prejudice to any other action the Ohio coal operators may deem necessary to take."

The operators have rejected this proposal as the railroads do not admit in a preamble that any readjustment of rates is necessary nor do they disclose what would be their attitude before the Interstate Commerce Commission.

The railroads are evidently aroused by the labor situation, but the consensus among the officials is that to lower freights would only beggar the railroads without remedying the condition, for the roads in West Virginia would only make further cuts to meet the competition.

The Norfolk & Western R.R. sought consent to be dismissed from the case brought before the Ohio State Industrial Commission, declaring that it is its intention and desire to haul no Ohio coal, being able to secure all the traffic desired from the West Virginia field. It might have favored the Ohio people with this singular stand when asking for a charter in Ohio to acquire its right-of-way. Of course, the commission refused to dismiss the case against the railroad.

The railroads have been asked to act voluntarily and reduce rates to accord with the decision against the Hocking Valley Ry., but such reduction would not satisfy the miners and operators. The rates were then cut 15c. between Armitage and Toledo, the old rate being $1 per ton.

Hocking Valley Ry. Wants Complaint Dismissed

The Hocking Valley Ry. desired that the complaint against it be dismissed on the ground that it recently filed this rate in a new coal tariff. A few weeks ago the Supreme Court approved the reductions just mentioned, which were ordered four years ago by the Utilities Commission, and the Hocking Valley Ry. hurriedly filed these new rates so that it could plead that the company was entitled to keep them in force for a year from the date of filing. The miners' complaint predates the filing of this new tariff, and that introduces a complication. The Utilities Commission decided that the Hocking Valley should remain a party to the action for the time being at least.

Illness of witnesses and general lack of preparedness forced a delay in the investigation, and it will be resumed on Tuesday, Aug. 17. Practically only two witnesses were questioned—General Freight Agent H. Q. Wasson and General Manager M. S. Connors of the Hocking Valley Ry. Mr. Wasson testified that coal is carried from Armitage to Toledo for $1.25; of this the Toledo & Ohio Central Ry. gets 71c., the Hocking Valley Ry. 44c. and the companies owning the Ohio River bridges 10c. Coal is carried from the Kenova district to Cleveland for $1.02; 37.2c. of this goes to the Hocking Valley Ry. and 59.8c. to the Norfolk & Western Ry., and 5c. is charged for loading.

Attorney Harry Arnold, for the Sunday Creek Co., examined both witnesses. From General Manager Connors he sought to show the cost of transportation of coal on the interstate shipments and the amount of work caused in handling the domestic product of the Ohio mines. Later he will attack this showing as tending to prove that the rate on the Ohio product is far too high.

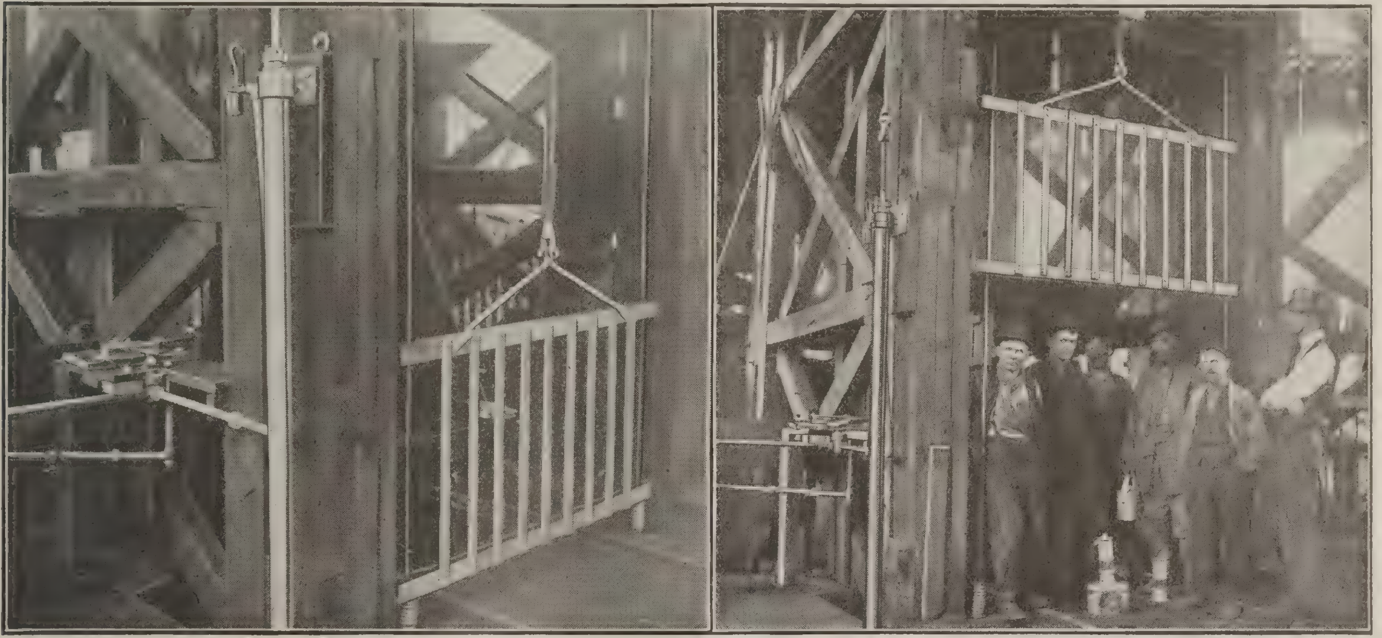
The fight thus far has been almost wholly between the Sunday Creek Co. and the Hocking Valley lines. That line of action was adopted because the Hocking handles most of the coal and its showing would make the most striking evidence.

The items relative to labor troubles in other states are of less interest than those in Ohio and will be reserved for publication in the next issue.

New Apparatus and Equipment

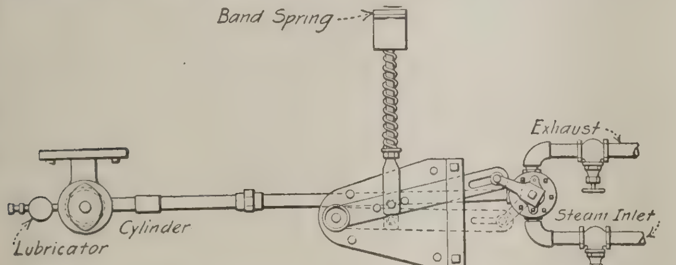
A Steam-Actuated Shaft Gate

The shaft gate shown in the accompanying drawings and illustrations has been designed by Thomas H. Tudor and Uriah M. Lenhard, two officials of the Pittsburgh-Westmoreland Coal Co. The gate shown in the photograph has been in operation for more than four months, with no expense for repairs or attendance since its installation, aside from the daily filling of the lubricator.



THE SHAFT GATE IN THE CLOSED AND OPEN POSITION

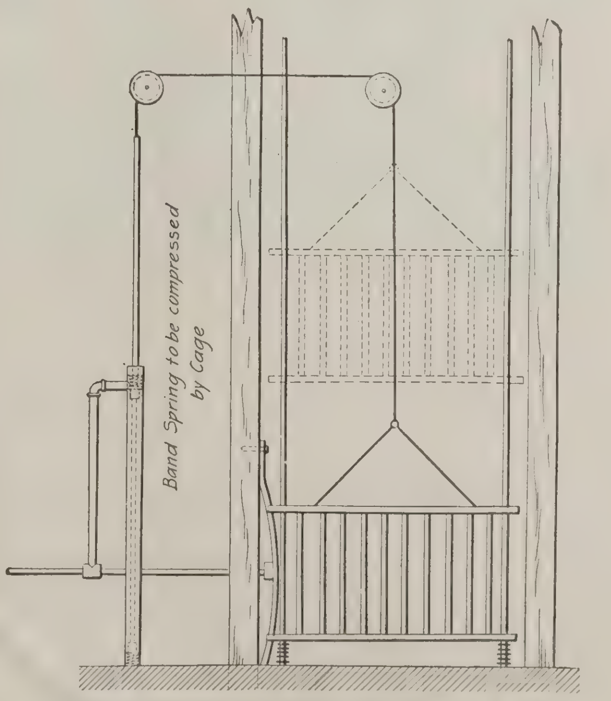
This gate is so arranged that the cage on coming to the landing throws the lever of the controlling valve, admitting steam or compressed air to the cylinder. This forces the piston down, lifting the gate through the medium of a cable passed over suitable guide pulleys. Suitable springs placed in the cylinder above and below the piston prevent it from striking the lower head when the gate is being hoisted or the upper head when the steam is exhausted.



THE VALVE MECHANISM CONTROLLING THE GATE

When the cage is raised or lowered from its normal position at the landing, the lever of the control valve is thrown in an opposite direction and the steam or air exhausts from the cylinder, allowing the gate to return to its normal position.

The time required to raise the gate or to allow it to settle to its normal position may be controlled by the action of two valves, one in the steam supply and the other in the exhaust pipe. These are adjusted until the desired time of raising and lowering has been secured, when they are allowed to remain in this position and by their throttling effect govern the speed of travel of the piston in the cylinder and the gate to which the piston is attached.



ARRANGEMENT OF CYLINDER AND GATE

This device is simple in construction and not liable to get out of order. It has received the approval of Alexander McCanch, mine inspector of the first bituminous district of Pennsylvania. It fully meets the requirements of the Bituminous Mining Law, as embodied in section 1, article 8.

The device is so constructed that if the cage is raised or lowered 12 in. from the landing position the gate immediately closes. This renders it practically impossible for an accident to occur at the ground landing.

The fact that the gate rises vertically instead of swinging horizontally is a great saving of time and space. With this device it is unnecessary to crowd the miners back from the cage entrance in order to open the gate or again when the gate is to be closed. As the device acts promptly and positively upon the arrival or departure of the cage, it saves considerable time, both of the cager and of the miners being hoisted or lowered.

⁂

The Kincaid Stoker

A type of stoker operating on the principle of spreading has been placed on the market by the Kincaid Stoker Co., 507 East Pearl St., Cincinnati, Ohio. This device may be used with equal facility on either externally or internally fired boilers—any type which may be hand-fired.

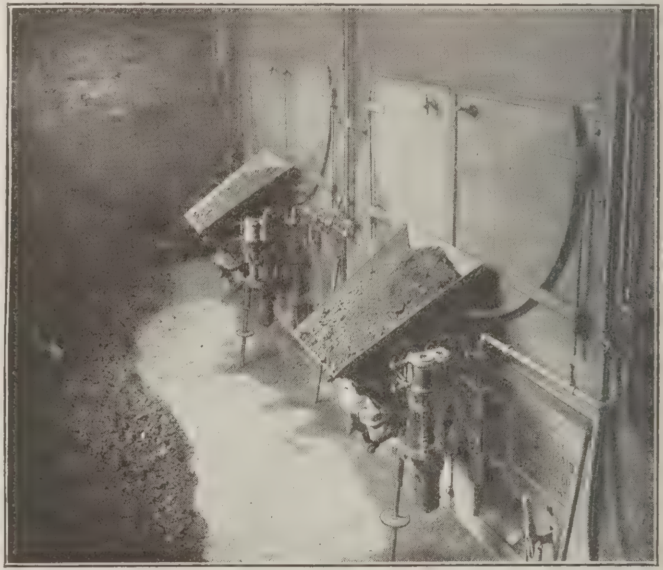
One of the secrets of successful hand stoking is the firing of small charges of coal at frequent intervals. The fire is thus not deadened by large quantities of green fuel, and the gases distilled are largely heated and burned and are not permitted to pass off as dense black smoke.

KINCAID STOKERS INSTALLED FOR BORDERLAND COAL CO., ARMEN, W. VA.

The Kincaid stoker employs ordinary stationary or rocking grates, and the fuel, once deposited on the fire, is not moved until it is disposed of as ash. Draft doors, dampers, etc., are handled precisely as with hand-fired boilers. The only change in the boiler setting necessary in the installation of this stoker is the substitution of a special lower boiler-front plate while the door jamb and arch are splayed or flared in. The entire stoker mechanism is mounted on the boiler front in place of the ordinary fire door.

A steam-driven ram pushes, or rather "kicks," successive charges of coal over the distributor plate, which spreads the charge in the furnace. Exhaust from this ram is made through a rectangular slot. The exhaust is so timed as to take place at the instant the charge of fuel is leaving the plate. The material is thus given a further kick by the steam.

The distributing plunger operates in a cycle of four strokes of varying feeds or intensities. The first or hardest stroke delivers coal to the rearmost quarter of the grate surface, the next over the next adjacent quarter, the third stroke over the next quarter, and the fourth or lightest stroke over the front quarter of the grate. The next stroke of the plunger, of course, starts a new cycle.



KINCAID STOKERS INSTALLED AT BORDERLAND, W VA.

The entire stoker mechanism, including the feed hopper, may be swung clear of the furnace opening to permit of cleaning or repair. A pair of crushing rolls in the bottom of the hopper reduces the coal from 8-in. lump and smaller to a size suitable to be spread over the fire. Mine-run coal may be fired if it does not contain too large lumps.

Fluctuations in Boiler Demand

Fluctuations in the demand on the boiler are accommodated by varying the number of charges of coal through a range of from 10 to 75 charges per minute. This variation is accomplished by regulating the number of strokes of the engine within a given length of time, and independently of the velocity of the piston, which remains constant in the cycle before referred to. The coal is spread evenly over the entire grate, building up a light, spongy fire, through which air passes readily and without difficulty. Since the coal is scattered evenly and in small amounts, the volatile gases are distilled at a practically uniform rate, which permits a perfect combination of these gases with the air. The result is that the gases distilled burn before they have a chance to become chilled by the boiler surface, and the furnace efficiency is consequently high.

This stoker requires no more headroom within the firebox than is needed for hand firing, nor does it require more space outside of the boiler than is taken up by the fireman. A space of 30x60 in. is required to swing the stoker around, while when in its operating position it takes up only 30x35 in.

The Kincaid stoker does not require expert manipulation. Inexperienced men have been taught to handle this machine in the course of one hour's time, maintaining a maximum and uniform steam pressure with ease. The work of handling the stoker is much less arduous than hand firing, and as the fire never needs hooking or slicing, the fireman is not exposed to the radiant heat from the open furnace door. Where mechanical means for handling coal are not provided, the low feed hopper is a decided advantage, as it is not difficult to fill this hopper with a shovel from the boiler-room floor.

The illustrations accompanying this article show two installations of Kincaid stokers for the Borderland Coal Co.—one at Armen and the other at Borderland, W. Va.

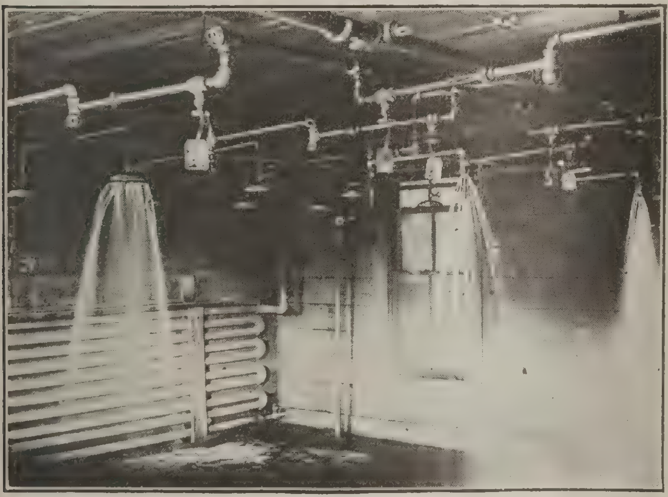
◆

The Circle Shower

The efficient heating of water through the medium of steam is a problem which has been effectively solved by the "Circle water heater, or shower."

This heater is extremely simple. It comprises a globe having a vertical stem and a lateral outlet. A steam nozzle enters the vertical stem and discharges, downward against the bottom of the globe. The steam is thus caused to pass through the lateral outlet with a whirling motion. The water inlet is connected with the side of the stem, and the action of the steam as it is condensed by contact with the water produces a suction that draws the water inward, and thus aids any head it may have. The incoming water and steam are thoroughly mixed, and the water is heated.

In the operation of the apparatus, the valve in the steam line is first opened, the condensation is allowed to discharge, and the valve is closed. The valve on the water line is then opened until the required flow of water is secured through the lateral outlet of the globe, after which the steam is gradually turned on until the water is heated to the desired temperature, which will not vary to any extent with a given setting of the valves.



THE CIRCLE SHOWER IN THE BATH HOUSE

This device was specially designed by Everett C. Circle, of Coalton, Okla., chief engineer of the power plant of the Oklahoma Consolidated Coal Co., for shower baths, where an even temperature is necessary. It is substantially built, and it operates positively for years without repairs, trouble or adjustment.

The illustration shows a corner of the bath-house at No. 3 mine, where the showers were given their first trial. On the left is shown the type formerly used, which were installed so that all showers were heated to the same temperature, regardless of the individuals' desires. Frequent renewal of some of the working parts was also necessary. Actual tests show the Circle shower uses about one third of the amount of water used in the old type and with more effective results.

To the right of the center is shown the evenly distributed flow from the Circle shower, and in the extreme right is shown a Circle shower with the condensed steam being blown out, which is the first step in the operation.

The Circle shower operates successfully in a variety of ways. It can be used with hot water, instead of steam. It may also be used in connection with an ordinary bathtub or shower cabinet. In short, it is so serviceable and simple that it can easily be placed, with gratifying results, in any convenient part of a home or shop, where the necessary connections can be secured.

After a thorough test of the Circle showers, they are being installed in all the bath-houses of the Oklahoma Consolidated Coal Co. and are being adopted throughout the Henryetta field generally.

Recent Legal Decisions

Right to Rescind Contract of Purchase—A coal-mining company, by retaining a purchased air compressor for two years, waived any right to rescind the purchase on the ground that the machinery did not possess the capacity it was guaranteed by the seller to have. Right to rescind a purchase is lost unless exercised within a reasonable time after discovering the breach of contract relied upon as ground for rescission. (Kentucky Court of Appeals, Meek Coal Co. vs. George D. Whitcomb Co., 176 Southwestern Reporter, 354.)

Validity and Breach of Fuel Sales Agency Contract—A contract whereby a fuel company agreed to give a firm of brokers the exclusive sale of the company's coke output on commission was not invalid for want of mutuality, although it provided that the agency should continue as long as the firm's services should prove to be satisfactory and bound the company not to quote prices to anyone else, the agreement binding the firm to keep the company supplied with orders and to collect and guarantee all accounts for coke sold. But the contract, being indefinite as to duration, was terminable by either party on giving notice to the other. The act of the company, however, in quoting prices direct to buyers cannot be deemed to be an election to revoke the contract; it will be treated as a breach of the contract entitling the firm to recover damages therefor. (Kentucky Court of Appeals, Elkhorn Consolidated Coal & Coke Co. vs. Eaton, Rhodes & Co., 173 Southwestern Reporter 798.)

Coal Docks Not a Nuisance—A railroad, some time after the grant of a right of way from the United States in the city of Missoula, Mont., constructed thereon a coal dock. Residents in the neighborhood, who had received title to their property after such grant, sued the road for maintaining a nuisance, alleging that coal dust from the dock penetrated into their houses, etc. They did not allege that the dock was improperly equipped or operated. The Supreme Court of Montana held that the railroad was not liable, since the grant carried with it the right to maintain all kinds of property and do all sorts of acts necessary in constructing and operating the road, the term "railroad" fairly including all structures necessary to its operation. While cases involving coal docks are rare, the authorities are agreed that, when the grant of a right of way is made to a railroad without restrictions, it contemplates not merely the railroad as it is established in the first instance, but the road with its necessary apppurtenances as it may from time to time come necessarily to be. (Smith vs. Northern Pacific, 148 Pac., 393.)

Editorials

The Rawness of the Union

A foreigner some twenty-five or thirty years ago remarked, "I cahnt understand what you despise in a mugwump. He seems to me a pretty decent sort of a chap instead of a cad and a bounder." But then he had not lived through the period of conflict, and so his American friends did not argue with him but smiled at him in a superior way or laughed at his simplicity.

They themselves probably did not know why party gripped them in such unbreakable bonds. For few of them realized how their reasoning was colored by the past or perceived that they discussed politics with their hearts rather than with their brains. Most of the Northerners believed that they made a sorry return for the sacrifices of their fathers when they voted the Democratic ticket, and most of the Southerners felt they were untrue to their kith and kin and color when they voted for a Republican. Thus mugwumpery was an offense.

Since then the very name has died. Mugwumpery had no martyrs, of course, but nevertheless it spread and lived as a practice while dying as a creed. But before it became common any "yaller dorg" could run for office if he got his party nomination and could get the party votes. "Yaller dorgs" was what they termed them, for it was a period when strong language was common.

This was the rawness or soreness of the American Union after its phenomenal conflict, for you cannot have a struggle without some sore heads and unhealed "anatomies." And very like to it is the soreness of the labor unions and of the United Mine Workers of America.

The miners' union has gone through its conflict and all those who belong to the union have that uncomfortable feeling of strife which we all felt when the struggle ended at Appommatox. But as the one soreness has worn away so will surely the other.

The guilds in Great Britain, when fighting became no longer necessary for existence, developed into the most peaceful organizations, promoting benevolences, protecting the weak, educating the young, inspecting the products of their members, constructing stately buildings, regulating the customs of the industry and performing patriotic services. And the union, we trust, freed from the stress of conflict, will also lose its rawness, will gather to its councils constructive, sober-minded, conservative labor men and will serve alike the industry and the state. Most of the organizations of mankind, given time, tend toward benevolence and social helpfulness.

But for this we must wait and have patience. Without conceding anything which should not be conceded we should look hopefully forward to a newer condition. If the leaders of thrift, morality and prudence continue as of late to gain ascendency in the union, that organization may conceivably be more generously fruitful than it has ever been destructive.

Among the hopeful things we can say about the United Mine Workers of America is that it has rarely been a grafting concern and sold immunity from strikes for money like the unions in the building trades. It has made almost no one rich. Its worst feature is its unrelenting hostility, its brutal treatment of mugwumps—whether they be moderates in the union or independents without; its animosity to corporations—be they unconscientious or philanthropic; its tendency to be always fighting. These are its rawnesses which are the outcome of its past; but history suggests despite its contradictions that the cause of the blister being removed, it will not be long in healing.

⁂

Progress in Mechanical Mining

History is not so much a chronicle of events as a record of the way in which those events impressed themselves on the people who wrote the history at a time roughly a decade after the events happened. As the philosophers would phrase it, history is subjective rather than objective. It represents not what people did so much as what they thought they were doing or had done.

If we pick up one of our national histories and try to trace the record of our mechanical development we find that the American intelligence rose to a great height in the middle of the last century and then mysteriously slumped away, till now there are no inventive geniuses left.

Every child learns about Elias Howe, the improver of the sewing machine in 1846, of C. H. McCormick, who invented the reaper in 1831, and of S. F. Morse, who in 1837 made telegraphy a success. Amasa Goodyear's improvements in rubber manufacture in 1844 and Cyrus W. Field's submarine cable in 1854 are all friends of our childhood days. So even is Dr. J. W. Draper for his work in establishing the art of photography. All these men get generous credit; sometimes some of them perhaps get a trifle too much, for it is hard sometimes to differentiate improvers from original inventors.

But while "there were giants in those days" history records little about others who have lived since—and yet, you say that there are others and that never was American invention so marvelous as today. Why then does the school history overlook these advances and tell us solely about statesmen and soldiers in the sixties and about politicians and statesmen thereafter? For this reason: History does not relate facts—only our attitude toward them.

As a result, inventive genius receives no honor, nor does it often receive even an appropriate pecuniary reward. The man who first schemes out a revolutionary improvement rarely makes money. The firm that exploits the invention does that. The inventor is entirely forgotten. The mining profession is just like any other. The new developments are unconnected with any names except those of the companies that purchase the patents and make the articles for the trade.

And even then it is considered the right thing to put on the soft pedal when we record the achievements of the new machines, as if the duty of the editor was to "damn with faint praise" every meritorious discovery. The reader also, trained to condemn the appearance of commendation of something sold for profit, is anxious to see that everything in a technical paper shall refer to subjects from which no one can earn a dividend. This animus has kept alive a lot of more or less fossil mining subjects. The publishing of them cannot possibly enrich anyone; therefore they are fit matters for publication.

We are only a few steps removed from the superstitions of the past. We are still in our hearts the victims of caste. Geology is a study from which a man can hardly make a living. It is unpatented, unpatentable, unsaleable—so it is a worthy study, almost on a par with astronomy and philosophy. It is the caste study of coal mining, but it won't cut coal. It is the dullest, slowest tool that the coal-mining journals exploit. It hardly makes in any way for efficiency; and so, being so cleanly immaterial, it is the very dean of mining—respected and venerable, but hardly able to support itself unaided.

To illustrate the unfortunate attitude which is growing on us, Secretary Lane's "Invocation to the Flag" might be introduced. Written as a general manager's note to his many employees, it is a splendid and stirring appeal to patriotism and loyalty and might well find imitation in "house organs" published for the benefit of employees. It certainly is a tribute to the altruism which is the glory of our civilization.

But the invocation is about to be placed in the schools, and it will there serve mainly to inculcate the idea that the Stars and Stripes represent nothing else than the people who wear the governmental dog collar—and muzzle. It may well be admitted that some of those in the government service are splendid idealists. But so also is the man on the street, the inventor, the lower-caste person who does not hold a government job. Does not the flag also represent him?

In fact, when read to the general public, for whom it was never intended, the invocation is only one mite less bad than that other unfortunate utterance of the Secretary of the Interior published in *Coal Age* on page 634 of Vol. 7. It appears that this created so much animadversion that its very publication in our columns, even with reprobation, has been regarded by some as an offense.

It had precisely the same fault as the "Invocation to the Flag," in that it magnified overmuch the work of the federal civil service. The public is being trained to believe that the only service worth while is the federal and looks with suspicion on all improvements and advances made by individuals. The chief work of government bureaus is to control industry rather than to lead it, and it is really surprising to note that the public admires the bridle rather than the horse which wears it.

A little generous recognition of the inventors of industry would do much to make a too often unprofitable occupation at least honorable and worthy of our aspirations. It would be well to suggest that our readers cast over in their minds the names of the inventors of improvements and developments of mining machines and equipment. In most cases they are hidden in complete obscurity. No seven cities are competing for the honor of their birth.

The socialist tells us that the great improvement in the building up of the world is the more equitable distribution of the receipts of capital, despite the fact that this distribution has changed but little in centuries and will probably never be perceptibly different to what now obtains, no matter whether the capitalist is a man, a municipality or a state.

The great change has been wrought by the inventor. Give the man who believes that the great advances have resulted from political activity a choice of being bounced along slowly in a box known as a sedan chair, like a rich man of a century or so ago, or of traveling in a seat on a railroad train comfortably and at express speed, and we know what his choice will be. The comfort of the workingman has not come from your politician or statesman, but from invention; yet our school histories, our magazines and even our technical journals are disposed to forget that we have any inventors.

⁂

As the Miners' Union Develops

One cannot avoid seeing hopeful signs in the labor movement, no matter how little of an idealist one may be. The miners are not without a constructive program, though it must be confessed that they and the operators, and the press of both, lay too much stress on the purely destructive and aggressive attitude within the industry.

The constructive interest shown in Illinois and Indiana in favor of a restricted competition, the desire to protect the operators in Illinois against the unfair practices of coöperative societies, which only pretend to pay the union wages, the fight in Ohio for fairer freight rates so that capital can receive a price for coal permitting the payment of the present schedule of wages, the coöperation in Wyoming, Illinois, Texas, Oklahoma, Kansas, Iowa, Missouri and Arkansas in securing mine safety and first aid, and the recent stand for the settlement of the quadrennial or biennial disputes without strikes are one and all signs of a worthy spirit.

They show that labor in coal mining realizes that there is a greater solidarity than merely that of labor. No solidarity is safe but that which concerns the whole industry. If the miner should burn down all the coal works, he would find himself farther from prosperity than he is today. He can easily cripple his employer by unreasonable action, but he will find, as he has recently in Ohio, that though the mine owner grumbles loudly at the heavy hand of the miner, that hand has after all been most greivously laid on the person and property of the miner himself.

Slowly a larger solidarity is being learned, and it is interesting to note that John P. White, the president of the United Mine Workers, rarely forgets it and always seeks, though sometimes vainly, the way of peace. Of course, when he demands too much a struggle must come, but he never deliberately seeks such an issue for the sake of showing his strength or gratifying his pugnacity.

If a glance at his straightforward countenance is not enough to assure one of his unquestionable honesty, his recent utterance is sufficiently convincing: "I have every reason to feel assured that the operators, like the miners, want to be fair. The public should not become alarmed at the stories of a strike nature, for the mission of the United Mine Workers is one of peace."

This statement is extremely conciliatory and shows that Mr. White appreciates the good purposes of the operators far better than some of those city journalists who exhibit themselves as the miners' friends and would increase their wages without paying any part of the bill.

Replacing the Saloon in Mining Communities

By Charles R. Towson*

SYNOPSIS—The saloon breaks up the monotony of the life in mining villages, and to compete with it or to replace it, it is necessary to find a force of equal or greater social value. Such a place must be more than a house; it must be in a sense a home and have someone who will sustain and control its activities.

A coal operator who is also a philosopher said recently, "The saloons in our state will be closed in a few months, and we are glad of it, but we must have a substitute." The saloon must go. It has shown itself to be incapable of improvement. Long ago religious reform spoke the word; education has explained it, and now their great economic ally, business, will enforce it. But with all its destructiveness, the saloon furnished a center and rendered a service needed in every community.

The very nature of men calls for a place to meet, to talk and to be friendly in a democratic way. The saloon has always furnished more than drink. It has been a social center. The clink of the glasses is a social and a natural speech. The saloon with the drink must go, but the social impulse, the desire for comradeship, for the clink of the glasses, will remain.

What substitute for the saloon is available? Those communities will be wisest that most quickly establish as a substitute for the saloon, a place of friendliness and cheer—a place where relaxation and recreation may be had without the destructive influence of the saloon. If this can also be made a place of constructive value, for physical, moral and mental improvement, so much the better.

DECOTA, OF THE CARBON COAL CO., KANAWHA COUNTY, WEST VIRGINIA

The first mining village in West Virginia at which a Y. M. C. A. was established

Contentment Is Better than Diplomacy

Mining communities afford little chance for the right use of idle time; yet there are few places where there is more of such time available. Monotonous work is bad, but the monotony of idleness is worse. Both are enemies to happiness and efficiency. It is strange how little thought or money is put into changing leisure time from a liability to an asset in such communities. Some employers are finding ways to improve the leisure life of the workers and their families, but more have ignored the need.

VISITORS AND OFFICIALS AT OPENING OF BENHAM, KY., Y. M. C. A.

From left to right, standing on ground—White L. Moss, then vice-president and general manager, Continental Coal Corporation, recently resigned; Tom Booze, local secretary Y. M. C. A.; H. H. Asher; J. C. Acheson, chairman of Kentucky State Committee, Y. M. C. A.; Philo C. Dix, state secretary of Y. M. C. A. in Kentucky; W. C. Tucker, superintendent, Wisconsin Steel Co., Inc.; C. R. Towson, secretary of the International Y. M. C. A. at New York City; C. J. Hickes, welfare man for the International Harvester Co. From left to right, on the porch—H. F. Perkins, president of the Wisconsin Steel Co., Inc.; Dr. A. Gatliff, of the Southern Mining Co.; a representative of the Louisville Courier-Journal; G. A. Ranney and Cyrus H. McCormick, general manager and president respectively of the International Harvester Co.

Many workers move from place to place for no other cause than sheer monotony. Others move because they have so little to anchor them. One operator realizing this purchased a large number of parlor organs and sold them among his people, not because they could play, but to make moving more difficult. Miners and their families have been known to walk miles to reach a village where a musical fakir entertained on the street. No means had been offered in their own village for satisfying the legitimate desire for entertainment.

The groups hanging around the stations, stores and corners in our coal-mining villages are witnesses to the fact that industry has not considered the human needs as scientifically as it has those of its machinery, markets and finances. It is a fact that we are experts on machine efficiency, but novices in developing man efficiency; and this in face of the fact that the greatest asset unrealized as yet in coal mining is not the resources of the mine, but of the miners. Leisure time can be used to help men grow in knowledge, energy, loyalty and contentment, but to use this leisure successfully leadership is needed.

---

*Secretary, industrial department, International Committee of Young Men's Christian Associations, 124 East 28th St., New York City.

EXTERIOR AND INTERIOR VIEWS OF Y. M. C. A. OF THE McALPIN COAL CO. AT McALPIN, RALEIGH COUNTY, W. VA.

The saloon has furnished a place of meeting and something of social intercourse, but its influence is not in the right direction. The substitute needed must not only furnish the place and the atmosphere, but positive and constructive leadership. Where can such a substitute be found?

Leadership Is Needed; Equipment Alone Will Not Assure Success

A place of recreation and social intercourse should be provided in every community. But this has often been done with disappointing results. Many employers have spent large sums of money for just such a purpose. For a time the employees and their families used it as intended; then lack of interest appeared, the property was carelessly handled, neglect and indifference took the place of the first enthusiasm. Gradually the men for whom the place was intended dropped away, and its use became limited to a small group of the office men. It is all too easy to find well-equipped clubhouses into which employers have put not only their money, but their heart interest as well, and yet the rank and file of the employees are missing, and the principal use of these buildings is for a weekly dance by a few "white collar" men and their families.

The point to be guarded is that such a place to be effective must be run upon a plan that fits the people, and back of that plan there must be a man. Leadership is essential.

Imagine a saloon without a saloon keeper! We wonder at the influence of the saloon in politics; but have we ever really analyzed the subject to discover just what it is that gives the saloon its power, its grip upon men? If the influence of the man behind the bar and the democratic plan upon which his institution is run could be transferred to a constructive basis, what a change would come in many communities!

TWO VIEWS OF THE BENHAM Y. M. C. A. FOR COLORED FOLK. THIS BUILDING WAS ERECTED BY THE COAL DEPARTMENT OF THE WISCONSIN STEEL CO., AN ALLIED INTEREST OF THE INTERNATIONAL HARVESTER CO.

A Place, a Plan and a Man

Imagine a place equipped to meet the needs of a community as a social center, also a plan for its use that fits the people, that recognizes their natural desires, and gives them a chance to run it themselves and a man to lead the work. Remember that, unlike the saloon, this place

CONSOLIDATION COAL CO.'S Y. M. C. A. FOR COLORED MINERS AT BUXTON, IOWA is established by mutual agreement of employer and employees, both having a direct interest in it; that the plan is determined by the men themselves, with the aid of the trained leader. Add to this the further fact that this leader is the representative both of the employees and the employer and has no commercial interest in either the place or the plan, but only a desire to be the friend and helper of every member of the community. Then we have some idea of what a constructive substitute for the saloon may be, and actually is, in scores of industrial centers, not a few of them coal-mining villages.

In the mining regions of Pennsylvania, West Virginia, Kentucky, Ohio, Iowa and Washington this work has been operated successfully. Some have doubted the efficacy of such a movement because of its avowed religious motive. But for more than thirty years it has been an ally of the railroads; it has been used by the United States Government in the Panama Canal, and in the reclamation camps of the West, and by the largest as well as by some of the small industries during the last decade; and it succeeds everywhere with every group of men, white or black, English-speaking or non-English-speaking, because its motive is religious.

Plan Does More Than Merely Consume a Man's Time and Excess Energy

It is more than a club; it appeals to more in a man than his desire for social intercourse; it takes hold upon his character life at the point where loyalty, integrity, contentment and real efficiency take root. It can be made an ally, not only of industry, but of every church, school, doctor and police officer in any place. It does not violate the creed of any church member nor supplant any other agency. The fact that a state and an international organization promote and supervise its work is a strong point, for this assures stability and a choice of trained leaders (secretaries). Yet each local organization is absolutely independent.

This plan was suggested to that philosopher-operator who wants a substitute for the saloon, and he agreed to put up two buildings at two of his mines, and two more miners' Young Men's Christian Associations will result. Of course before these buildings are erected it will be discovered whether the miners and their families want this feature in their community; but no group of industrial workers of any color or creed in any part of the country has ever turned down this plan when it has been presented clearly.

Some operators testify that drunkenness has disappeared; others say that the receipts of liquors through express agencies have been cut in half, and in some places saloons have been actually closed by opening a modern industrial type of Young Men's Christian Association. It is a substitute for the saloon, and something more.

⁂

School Building in Anthracite Region

Eighteen new schools have been constructed during the last year in the five principal anthracite-producing counties of Pennsylvania—Carbon, Lackawanna, Luzerne, Northumberland and Schuylkill—at an aggregate cost of nearly $900,000. Although the greater part of the school taxes is paid by the anthracite operators, and there were many magnificent school buildings in the anthracite region before this year's construction, they and all other taxpayers welcome additional educational facilities. Many of the school buildings are utilized at night for the teaching of miners in their chosen work.

At Franklin in Carbon County a new school has been constructed, and in Lackawanna County there are five new schools—No. 7 at Carbondale, the new school at Archbald, the Wildcat school, also at Archbald, and the primary school at Jermyn. In Luzerne County have been added the Georgetown school of Wilkes-Barre township, the high school of Larksville borough, the Concrete City school of Hanover township, the G. W. Guthrie school of Wilkes-Barre, the high school of Nanticoke and the high school of Pittston. In Northumberland County there are three new schools—one at Marion Heights and two at Milton, one being known as the Grant school and the other as the central grammar school. Schuylkill County has a new school in Wayne township, the Marlin school in Norwegian township, the West Ward school in Coaldale and the Tamaqua school in Rahn township.

Two of these schools, those at Nanticoke and Pittston, cost over $200,000 each, and the G. W. Guthrie school at Wilkes-Barre cost $100,000. The aggregate cost of the list furnished by the State Board of Education at Harrisburg was $890,781.

⁂

The Dark Days

By Walt Mason

(Written expressly for *Coal Age*)

The sun's a winner, all men know; without it green things wouldn't grow, of beauty there would be a dearth, and health would perish from the earth. Oh, if it ceased to light the sky, we'd soon be tired of life and die. These facts are bromides gone to seed—so plain that he who runs can read.

Yet when the sun won't take a rest, but scoots along from east to west, day after day, week after week, we have too big a grouch to speak. "This sunshine is the bully stuff," we say, "but plenty is enough; we aren't hoggish, Sol, old chap; don't send us all you have on tap, but save a little of your glow for winter, when we're having snow."

And if the clouds obscure the sky, responsive to our heartfelt sigh, and thunder rips around and roars, and lightning splits the whole outdoors, we chortle with exceeding glee, turn handsprings in our ecstacy.

And thus the business men should greet the dark days with a nosegay sweet. If things should always come his way, and there should be no dismal day, he'd tire of such an easy graft, and say, "I wish I had a raft of obstacles and ills that blight, to show that I am built to fight!" He'd have no chance to analyze his weakness or to strength get wise; he'd gain no credit, though he won all kinds of plain and fancy mon'.

For any man who's worth a dime detests good sledding all the time. He wants to show he is a chap who has a store of vim and snap, and where the spineless critter frets, he on his nettle bravely gets, and strips disaster of its hide, and cuts a swath a furlong wide.

Dark days are good for any man; they make him use his brains and plan, conserve his capital and learn to value dollars he may earn. So, Mr. Manager, don't fret when come the days, dark, blue and wet; look forth with calm, undaunted gaze, and say, "I like these gloomy days!"

Discussion by Readers

Misuse of Black Blasting Powder in Mines

Letter No. 1—While we all agree that there is much danger in the unrestricted use of black powder for blasting coal and rock in mines, this explosive has been blamed many times for results that come from its misuse and are due to the ignorance or foolhardiness of the man rather than the nature of the explosive. For this reason I have prepared this article on the uses of black blasting powder to show that accidents resulting from its improper use may be eliminated by its proper use.

During several years of service in mines, especially those of West Virginia, I have observed that the improper uses of black powder have contributed very largely to the numerous fatal and nonfatal accidents that have occurred and resulted in much damage to mining property. In most cases extraordinary care is taken in gaseous mines to avoid accidents liable to result from the improper use of so-called permissible explosives. Competent shotfirers are being employed, the best grade of explosive is selected for blasting and noncombustible material is furnished for stemming. Moreover, as a further precaution locked safety lamps are being used exclusively and the coal dust is kept thoroughly watered by various means that are adopted.

Let us inquire to what extent any precautionary measures have been adopted in many nongaseous mines with respect to preventing accidents that are liable to result in loss of life and damage to property from the improper uses of black powder. Experienced as well as inexperienced miners are permitted to perform the work when blasting coal with black powder, and in many instances accident results from overcharges purposely made to bring the coal down in easy-loading sizes. I admit that noncombustible material is being furnished for stemming in some though not in all of the mines. Many charges of black powder have been stemmed with fine "buckdust," as the machine cuttings are commonly called, which is highly combustible. Furthermore, watering of nongassy or dry-and-dusty mines, as a rule, is not as carefully practiced as is the case in gassy and dry-and-dusty mines. Copper-tipped tamping bars and copper-tipped needles are being used by some, but not by all of the miners.

It appears to me that in this respect the wagon is being placed before the horse and that it is necessary to adopt proper remedies. It seems reasonable that we can increase the safety of the mines by permitting only competent men to blast the coal when using black powder and by insisting on their using reasonable and safe charges, stemming with noncombustible material and using copper-tipped tamping bars and copper-tipped needles only.

By examining the annual reports of the West Virginia Department of Mines, it will be observed that a number of mine explosions in which many miners were killed were caused by the improper use of black powder; and the damage done to the mines and delays in operating after the trouble occurred has caused large losses to both operators and miners. Many roof falls that have killed miners have been due to the improper placing of shots too close to the roof, thereby making the latter unsound. Roof falls amounting to thousands of cubic yards annually and which must be removed at the expense of the operator are caused by pointing auger holes too near to the roof, causing it to become unsound and to fall.

Again, owing to the overcharges of black powder the mine atmosphere naturally is not as good as it would be if proper amounts of black powder were being used. Although the West Virginia mining law requires that miners shall not enter their working places until 20 min. has elapsed after firing a shot, this requirement of the law is in many cases not being obeyed. Of course, when miners rush to the face of the working places immediately after the coal has been shot they expose themselves to dense volumes of powder smoke, which if inhaled day after day will eventually affect their health and reduce their ability to perform a good day's work.

It cannot be denied that, in the past, black powder used by inexperienced mine employees has been the cause of mine disasters causing loss of life and injury to employees and damage to property. In my opinion, only experienced miners should be permitted to blast the coal, as it is necessary for the men doing such work to know by experience the amount of powder required to bring the coal down and avoid using an excessive charge. Men doing the blasting should be taught by men experienced in this work and should not be permitted under any consideration to fire shots until they can give satisfactory proof of competency to the mine officials.

Unavoidable mine accidents will happen, but avoidable ones caused by inexperienced miners blasting the coal should be eliminated. It is deplorable when we read annual reports that have been issued by the West Virginia Department of Mines to observe that fatal as well as nonfatal accidents have been caused by the carelessness of the miners; and many of these accidents can be attributed to the improper use of black powder by inexperienced men. Naturally, miners do not like to work in mines where accidents constantly occur. In many instances where accidents have occurred the mine was idle that day and perhaps for days previous, depending of course on the severity of the accident. The burden of these losses, financially and otherwise, must be borne by the miners and the operators.

To the astonishment of West Virginians, past history shows that mine disasters have occurred in what are usually termed "model mines." Investigations into the causes of these disasters revealed that blownout and overcharged blasts and blasting coal on the solid were the primary causes. If in future the blasting of coal with black powder is permitted to be done only by experienced miners, the mines will become safer for work, and as a result fatal and nonfatal accidents will be eliminated to a large extent and the safety of property enhanced.

Let us not forget that two things cannot occupy the same place at the same time; no more can we have safety so long as we permit danger to lurk within the mines. Only experienced miners should be allowed to do the blasting of coal and handle black powder, if we expect to eliminate one of the dangers lurking in coal mines.

KARL F. SCHOEW.

⁂

Removal of Powder Marks

Letter No. 1—A matter of grave importance to all miners and referred to in discussion by the National Mine Rescue and First-Aid Conference, held at Pittsburgh, Penn., Sept. 23-26, 1912, is the question of whether it is possible to so treat victims of powder burns as to efface the marks resulting therefrom. My attention was drawn to the statements made by Drs. J. J. Rutledge and W. S. Rountree, as published on p. 42 of Bulletin 62, Bureau of Mines. Dr. Rutledge stated the case of a man injured in a mine by the explosion of a blast that he, in company with others, had approached unwarned. This man had received 107 punctures of the skin, and in some of these could be seen through the skin particles as large as the end of a thumb. Otherwise, the man's physical condition was perfect.

In response to a member of the Hospitals and Safety-Station Committee as to whether or not it was advisable to wash such a wound, Dr. Rountree stated as follows:

> We have quite a number of injuries of this sort in our mining district. Long ago, men whose faces were blackened by explosion went through life that way. They were simply treated in a way, and the coal dust remained in the wounds. In the last few years we have never sent a man away with a black face after such an accident. With a salt solution and a stiff brush, every particle of coal dust may be removed. Sometimes the coal dust is buried so deep it cannot be reached with the stiff brush, but with a curette all particles may be removed. The only way we have been successful with these patients was to immediately anesthetize, scrub with brush or curette, wash with salt solution and dress with sterile bicarbonate or some other dressing. Sometimes, after a patient goes 24 hours or so the face swells, and many particles are shoved up and are thus much easier to remove, even at that time; but by letting them go so long, more infection is caused. However, such infection is not so dangerous as infection received on the surface. The use of a stiff brush destroys some tissue, but causes no scars, and practically all the dirt can be reached with the brush.

This statement of Dr. Rountree, to the effect that he had never sent a man away with a black face after such an accident, is interesting, inasmuch as many mining men know of numerous cases where patients have recently been discharged from hospitals as cured, but with blackened faces.

As I have stated before, it is a matter of grave importance to know whether such results are due to the carelessness or ignorance of the surgeons in charge. In either case, it is the right of the coal-mining industry to know the facts. If the treatment described by Dr. Rountree is efficacious and will effect the removal of the marks of the powder, there can be no excuse for the discharge of men from hospitals as being cured, while these marks remain to disfigure their faces.

Such a disfigurement is not only a handicap to the man himself, but advertises the occupation of coal mining as one of great hazard, while it also reflects on the intelligence or efficiency of certain hospitals. Let there be a discussion in *Coal Age* that will lead to a thorough investigation of this important matter.

RALPH W. MAYER.

Roslyn, Wash.

Need of First-Aid Instruction

I agree heartily with the suggestion that first-aid instruction should be given more generally to all mine employees, so that there might always be someone around who would know a few simple things that ought to be done in case of accident. All persons should know how to stop the flow of blood from an artery; how to rescue a drowning person; what to do to succor a person in contact with a live wire, or to resuscitate one overcome by gas.

The more general need for this work of instruction was deeply impressed on me a few days ago by an incident that occurred on the tracks in front of the tipple of the mine where I work. It was early in the morning as the men were coming to the mine. I was proceeding up the track toward the mine when the engine and cab of the coal train passed me at breakneck speed. I knew at once that something was wrong, as trains were never run on the coal siding at a speed greater than 20 mi. an hr.

On reaching the tipple, my fears were realized when I learned that a young boy, who was riding to the mine on the cars, had jumped from the train before it stopped. In attempting to cross the track ahead of the moving cars, he slipped and fell. Retaining his presence of mind, however, he succeeded in rolling clear of the track, except his left leg, which was cut off by the wheels at a point above the knee. The accident was witnessed by many of his fellow-workmen who were riding in the first car. They all realized that something must be done quickly to save the boy's life, but no one understood how to stop the bleeding which would soon result in death. They only thought of getting him to the hospital as quickly as possible, and the engineer and train crew were doing all in their power to shorten the time of the trip. But the boy died that night from loss of blood.

This is not the first case of its kind that has happened and I don't suppose it will be the last. We never know who will be the next victim of accident or when an accident will occur. Hence it is our duty to do everything possible to give first-aid instruction to all mine workers. It may happen that an opportunity will never offer to apply the knowledge gained of first-aid treatment; but this is no reason why everyone should not possess himself of sufficient knowledge to give such treatment to another injured by accident. An accident is always unforeseen.

Personally I think that the mining laws of every state should compel all operators to maintain at their plant at least a few trained men who are competent to give first-aid treatment in case of accident. The mining laws of many states require mine operators to keep on hand ready for use a supply of first-aid material; but how many of these laws say anything about the training of men in first-aid work and in the proper use of the material required to be kept on hand? I would ask, What good are tools or supplies if no one present is competent to use them?

JAMES T. REYNOLDS, Safety Inspector,
Houston, Penn. Aetna Life Insurance Co.

⁂

Preventing Mine Explosions

Letter No. 5—In his Letter No. 3, *Coal Age,* July 24, p. 143, William Crooks criticizes the statement that appeared in my previous letter, May 8, p. 819, which reads, "As long as coal is mined, disasters must occur," etc. My original copy read "As long as mine disasters occur, there will be miners to be rescued." I presume Mr. Crooks would accept the latter statement without criticism, as it does not imply that these sad occurrences are "inevitable" in coal mining. The change in the wording came in the editing of my copy.

However, while it is true that mine explosions have occurred ever since coal was mined to any considerable extent, and probably will continue to happen for some time to come, it is undoubtedly the desire and hope of all mining men that mine explosions will eventually be eliminated and remembered only as matters of history. We will all agree that that time has not as yet arrived. I firmly believe that we still have some things to learn and understand relative to the causes of mine explosions before these will cease to occur.

The suggestions offered by J. Riley, May 29, p. 938, and Edward H. Coxe, July 3, p. 27, as well as those presented by Mr. Crooks, in his letter, p. 143, are all good and practical, as means of preventing or at least reducing the number of mine explosions, if the same are strictly followed. But I would ask, Will they eliminate such explosions? It seems to me that there are other things we must know and other causes we must understand before we can expect to successfully contend with the conditions that make mine explosions possible.

How much do we know in regard to the effect of strong air currents, and the greater or less amount of available oxygen in the mine air, and to what extent these are actual factors in the initiation of an explosion in a mine, as has often been suggested by John Verner, former mine inspector in Iowa? Again, do we thoroughly understand to what extent or in what way changes of temperature, barometric pressure and seismic disturbances create conditions favorable to explosions in the mine?

It must be acknowledged by a candid mind that efficient and competent men in charge of mines have not always been a means of preventing the occurrence of explosions therein. The records show that some of the most disastrous accidents have happened in mines that are well regulated and under the best possible supervision.

Again, well-regulated mines have been operated for a number of years by such competent and trained men, without the occurrence of an explosion, and yet a little later the mine, under the same management and subject to the same conditions, as far as can be ascertained, has suddenly been the scene of a disastrous explosion. In some instances the cause may be attributed to a human factor, but there are other instances in which this cannot be shown. I want to say that only when these conditions or causes are thoroughly known and understood may we expect that mine explosions will be eliminated.

JOHN ROSE,
Former District Mine Inspector.

Dayton, Tenn.

⁂

The Pennsylvania Amendment

Letter No. 2—The recent changes in the mining law of Pennsylvania will be far-reaching in their effects and ultimately disastrous to every phase of the industry, if the predictions of many thoughtful men do not fail. By the passage of this amendment, as described in *Coal Age,* July 24, p. 145, the State of Pennsylvania has given up a substantial good and is groping for a shadowy illusion, supposedly something better.

Under the operation of the present law, the state exercises a degree of judicial and executive authority over the operation of the coal-mining industry that enables it to enforce important provisions relating to the sanitation of mines and the safeguarding of the health and lives of mine workers. Under that law, the state holds responsible for the enforcement of its provision the men who have been licensed by the state as being qualified for their official duty. Their qualification has been duly ascertained by an examination conducted by regularly commissioned officers of the state. The candidates in examination have demonstrated their knowledge of the principles and practice of coal mining and received the state certificate of competency required by law.

Since their enactment, these provisions of the law have been productive of a great advancement among coal miners, supplying them with a motive and incentive for study and resulting in the improvement of faculties that hitherto were dormant. This training has incidentally produced a higher grade of citizens. It goes without saying that a law the operation of which tends to produce more efficient workmen and to develop a higher standard of citizenship is of material benefit, not only to the coal-mining industry, but to the entire commonwealth.

It is a matter of general observation that one of the effects of the qualification required by law has been to develop mine officials of broader views. This necessary qualification has developed those faculties that have enabled men to realize that in order to produce the greatest results one must not only possess a working knowledge of his calling, but (what is of far more importance) a good knowledge of human nature.

By the amended law it would appear that the state has abrogated its power to adjudicate the operation of its mines. It may well be asked, Why has such a surrender of governmental right and authority been made?

In regard to the amendment operating to displace the legally qualified man, I am not apprehensive of such a result, since the qualified man is a profitable financial investment for every mine operator, and it is not logical to assume that such can or will be replaced by men of less technical training and ability. But it must be admitted that the abasement of the high standard previously maintained has a tendency to lower the dignity of the official position in the mine.

Unfortunately the amendment has substituted for a statutory supervision and control of mining operations an arbitrary and concentrated control invested in the mine owner or operator, who thus becomes his own law. Stated briefly, such a concentration of power is a menace to the bulwarks of our democratic government. In effect the amendment has placed the operator outside the pale of the state and made him a law unto himself. It must be admitted that nothing has been gained, but much has been lost to the miner by its passage. I believe the general opinion prevails that the amendment practically annuls the law, and the work of 35 years of constructive legislation that has materially benefited those employed in the industry has been destroyed.

In respect to the Workmen's Compensation Act, it should be observed that the act is optional in its provisions, while the amended mining law is positive and absolute. These two combined produce, incidentally, an unexpected result. Whether an operator elects to work under the provisions of the compensation act, he is still clothed with the absolute power conferred upon him by the amendment.

The benefit of the act to the workman is questionable. Should a company refuse to operate under the provisions of the act, an injured employee has no recourse except to common law, which at the best is uncertain in its results. On the other hand, if a company elects to operate under the provisions of the act, the payment of the price practically exempts the management from all financial responsibility for the safety of their employees, which then becomes a secondary consideration. The premiums paid to meet the requirements of the compensation act will not come out of the net profits of the operator, who will continue to demand the same returns on his investment as before, which is his legal right. The Workmen's Compensation Act is simply an insurance in which the operator pays directly the premiums on the policies of his employees. The operator will naturally reduce his premiums to a minimum by taking only the best risks and refusing to employ those who are physically defective, or who cannot pass a medical examination, or are advanced in years. Has the state provided for such a result?

A compensation act is a good provision and a necessary one, but its burden should not rest on any one class—it should be borne by the community as a whole, since all are directly or indirectly benefited by the labor of the men whom the act is intended to protect. However, when the operation of the act means the removal of the safeguards already in force and designed to protect human life, to say nothing of the annulment, practically, of the right to labor, it becomes an unmitigated evil.

In closing, permit me to suggest that the operation of the amended law will render abortive the authority of the local executives of the law—the mine inspectors, who are still retained in their positions at great expense to the state. In the bituminous field alone there are at present 28 mine inspectors, which means an annual expenditure of over $80,000 in salaries, besides office, traveling and other expenses.

It has been roughly estimated that the expense to the State of Pennsylvania incident to the establishment of the Bureau of Insurance in connection with the Workmen's Compensation Act, for the first fiscal year, will aggregate a half-million dollars. The results will be eagerly watched.

A. M. INER.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Relation of Volume and Pressure of Air and Gas—For a constant temperature, the volume of air and gases varies inversely as the pressure supported. In this connection, pressure is often estimated as one, two, three, etc., **atmospheres,** meaning that the pressure supported by the air or gas is one, two, three, etc., times the normal atmospheric pressure at that place. This is commonly known as **Boyle's** or **Mariotte's law of volume.**

An "atmosphere" is sometimes incorrectly taken to mean normal sea-level pressure (14.7 lb. per sq.in.). Such a meaning of the term, however, would manifestly limit its application to sea level, or furnish an arbitrary standard inconvenient for use.

The term **"free air"** relates to atmospheric air at any elevation and for any condition. According to the above rule, when free air is compressed to two, three or four atmospheres its volume is reduced to ½, ⅓ or ¼ of the original volume, assuming the temperature remains constant. At the same time, the pressure or **tension of the air** is increased to two, three or four times the atmospheric pressure, whatever that may have been, or the free-air pressure, assuming always a constant temperature.

The **expansion of air,** by the same law, is accompanied by a fall of pressure, the **volume ratio** being equal to the inverse **pressure ratio,** for the same temperature. The pressure refered to here is the **absolute pressure,** or the pressure above a vacuum or zero.

Relation of Absolute Temperature and Pressure of Air and Gas—For a constant volume, the absolute temperature of air and gases varies directly as the absolute pressure.

Volume, Temperature, Pressure of Air and Gas—The relation of the volume (v), pressure (p) and absolute temperature (T), for a given weight of air or gas is expressed simply by the following formulas:

Const. Pressure	Const. Temperature	Const. Volume
$\frac{v_2}{v_1} = \frac{T_2}{T_1}$	$\frac{v_2}{v_1} = \frac{p_1}{p_2}$	$\frac{p_2}{p_1} = \frac{T_2}{T_1}$

The relations of volume, temperature and pressure of air and gas depend on two main conditions: 1. The gas may or may not be free to expand. 2. Heat may or may not be added or taken from the gas.

Addition of Heat—Two cases may arise, as follows:

(a) If the air is confined (constant volume) the rise in temperature is more rapid, since all the heat is then transformed into heat energy or **internal work,** and the pressure rises accordingly.

(b) If the air is free to expand (constant pressure) the rise in temperature, for the same addition of heat, is much less rapid. In this case, the air in expanding performs **external work** against the pressure it supports. A part of the heat added is thus absorbed in doing outside work, while the remainder, only, is available for internal work and manifest as heat energy, thus causing a lesser rise of temperature.

The Coal Age Pocket Book

Work of Expansion of Air—When air is expanded by the addition of heat the external work performed can be calculated in two ways, as follows:

1. On a heat-unit basis, by subtracting the heat absorbed, per pound of air, per degree rise in temperature, for constant volume, from the heat, per pound, per degree, for constant pressure; and multiplying this difference, which is the heat converted into external work, by the foot-pounds per heat unit; thus, since 1 B.t.u. = 778 ft.-lb.,

Heat, per lb.-deg. (sp. heat, const. pressure) ..... 0.2374 B.t.u.
Heat, per lb.-deg. (sp. heat, const. volume) ...... 0.1689 B.t.u.

Heat, per lb.-deg., available for external work.. 0.0685 B.t.u.

External work, per lb.-deg..........0.0685 × 778 = 53.29 ft.-lb.

2. The external work performed in the expansion of air, per pound, per degree, can be calculated, also, very simply by multiplying the volume of 1 lb. of dry air, at 1 deg. F., absolute, and 1 lb. per sq.in. pressure (0.37 cu.ft.), by 144, the number of square inches in 1 sq.ft.; thus,

External work, per lb.-deg............0.37 × 144 = 53.28 ft.-lb.

Adiabatic Expansion and Compression—When there is no addition of heat in the expansion, or no loss of heat in the compression of air or gas, the relations of volume, temperature and pressure follow other laws than those previously given. Such expansion or compression is described as **"adiabatic,"** meaning no passage (of heat) in or out of the gas.

In **adiabatic expansion,** there being no addition of heat, the increase in volume is at the expense of the internal energy and a fall of temperature is the result, which is accompanied also by a fall of pressure.

In **adiabatic compression,** there being no loss of heat, the internal energy is augmented by the heat of compression, and the result is an increase of both temperature and pressure.

Adiabatic Formulas—The following formulas express the relation of volume (v), pressure (p) and absolute temperature (T), for any given weight of air or gas, when expanded or compressed without gain or loss of heat. In actual practice it is only possible to approximate adiabatic expansion or compression.:

$$\frac{v_2}{v_1} = \left(\frac{p_1}{p_2}\right)^{0.7117} \qquad \frac{v_2}{v_1} = \left(\frac{T_1}{T_2}\right)^{2.469} \qquad \frac{p_2}{p_1} = \left(\frac{T_2}{T_1}\right)^{3.469}$$

$$\frac{p_2}{p_1} = \left(\frac{v_1}{v_2}\right)^{1.405} \qquad \frac{T_2}{T_1} = \left(\frac{v_1}{v_2}\right)^{0.405} \qquad \frac{T_2}{T_1} = \left(\frac{p_2}{p_1}\right)^{0.288}$$

It is important to observe that adiabatic expansion or compression always involves a change in temperature. Where the temperature is maintained constant, by adding heat in expanding, or extracting heat (cooling) in compressing, the change in volume is described as **"isothermal"** expansion or compression. In practice, it is only possible to approximate isothermal conditions in the expansion or compression of air or gas.

The application of the above formulas necessitates the use of logarithms.

Inquiries of General Interest

Space Occupied by Sized Coal

Kindly state the space required to store the different sizes of anthracite and bituminous coal in bins.

INQUIRER.

Dayton, Ohio.

The space occupied by coal stored in a bin depends chiefly on the specific gravity of the coal, and to some extent on the size to which the coal is broken.

The average specific gravity of anthracite may be taken as 1.5, making the weight of a cubic foot of average anthracite $62.5 \times 1.5 = 93.75$ lb. The space occupied by 1 long ton (2240 lb.) of solid anthracite is therefore $2240 \div 93.75 = 23.9$ cu.ft. It is estimated that mine-run coal, both anthracite and bituminous, will occupy about two-thirds more space than the same weight of solid coal. Therefore, the space occupied by 1 ton of mine-run anthracite would be approximately $23.9 \times 1\frac{2}{3} =$ say 40 cu.ft.

The specific gravity of bituminous coal varies from 1.2 to 1.5. Taking the average specific gravity of this coal as 1.35, the weight of 1 short ton (2000 lb.) of solid bituminous coal is $2000 \div (62.5 \times 1.35) = 23.7$ cu.ft. Therefore, a ton of mine-run bituminous coal will occupy approximately $23.7 \times 1\frac{2}{3} =$ say 40 cu.ft.

These calculations give the general rule that a long ton of anthracite or a short ton of bituminous coal (mine-run) will occupy approximately 40 cu.ft. of space in a bin.

In the sizing of coal, the larger sizes, as "broken" or "egg," may occupy slightly more and the smaller size of "chestnut" slightly less than the space mentioned. But the finer grades of pea, buckwheat and rice coal, owing to their greater purity or freedom from refuse, weigh lighter, and consequently require a somewhat greater space per ton, than that mentioned. However, these differences will not exceed 5 per cent., in any case.

⁂

Effect of Storage on the Analysis of Coal

If bituminous coal is stored in the open for six months, and an analysis is made at the beginning and end of this period, how would the extent of deterioration be determined?

R. T. M.

Terre Haute, Ind.

The extent of deterioration in the coal would be determined by the percentage of loss in heat value. For example, the difference in the calorific values of the coal at the beginning and at the end of the period of storage will show a loss in heat units (B.t.u.). The percentage of this loss is then calculated from the original heat value of the coal.

This will be clearly understood from the following tabulated results of the experiments carried out by the United States Government for the purpose of showing the effect of storage on coal. Four different types of coal were selected for this purpose, as follows: 1. New River coal, West Virginia, as being the type of coal largely used by the Navy. 2. Pocahontas, Va., as being the type of steaming and coking coal used in the Eastern states. 3. Pittsburgh, Penn., as representing a rich coking and gas coal. 4. Sheridan, Wyo., as representing a sub-bituminous or black lignite, much used in the West. The results of the experiments were as follows:

Kind of Coal	Storage Conditions	Heat Value of Coal (B.t.u.) As Stored	After 1 Yr.	After 2 Yr.	Per Cent. Loss
New River, W. Va.	Run-of-mine coal exposed to air indoors; Portsmouth, N. H.	8,754	8,748	8,734	1 yr., 0.07 2 yr., 0.23
	Run-of-mine coal exposed to air outdoors, uncovered; Portsmouth, N. H.	8,775	8,760	8,722	1 yr., 0.60 2 yr., 0.17
Pocahontas, Va...	120-ton pile, run-of-mine coal, outside; Panama	8,794	8,762	....	1 yr., 0.36
Pittsburgh bed....	Run-of-mine coal, open bin, outdoors, Ann Arbor, Mich.	8,541	8,526	....	1 yr., 0.17
Sheridan, Wyo....	Run-of-mine coal, open bin 5 ft. deep; Sheridan, Wyo.	7,370	....	7,135	2¾ yr., 3.19
Sub-bituminous...	Run-of-mine coal, closed bin 5 ft. deep, Sheridan, Wyo.	7,370	....	7,094	2 yr., 3.75

The table gives a condensed summary compiled from the results of a large number of test determinations. To eliminate the effect of incidental impurities, the calorific values are calculated on a moisture-free, ash-free and sulphur-free basis. The results of the experiments show a loss in heat value of less than 1 per cent. for New River, Pocahontas and Pittsburgh coal stored in the open. The Wyoming coal alone of these four types showed any considerable loss in heat value during storage. This greater loss was undoubtedly due to the special character of the Wyoming coal.

In one case coal stored for two years at Key West, Fla., showed a loss in heat value ranging between 1 and 2 per cent. From these facts, and a large number of similar experiments, it may be stated that the loss in heat value of coal during storage is greatly overestimated.

Permit me, in closing, to add a few brief words regarding the storage of coal under water. Storage under these conditions undoubtedly preserves the heating value and the physical strength of coal; but such storage practically makes necessary the firing of wet coal and the consequent evaporation in the furnace of added moisture varying from 1 to 15 per cent., according to the kind of coal. This factor is an important drawback in many cases to the under-water storage of fuel.

On the other hand, submerged storage is an absolute preventive of spontaneous combustion and may on that account be sometimes justified; but unless the storage period is to be longer than two years, there seems to be no ground for storing coal under water merely for the saving in calorific value to be obtained.

PERCY N. COUPLAND,

New York City.

Examination Questions

Alberta (Canada) Examination, June 15-17, 1915

(*Selected Questions*)

Ques.—Water accumulates at the rate of 200 gal. per min. at the foot of a shaft 600 ft. deep. If power for pumping is available for 8 hr. in the 24, what will be the horsepower of the pump required to drain the sump?

Ans.—The quantity of water to be handled, in this case, is $200 \times 24 \div 8 = 600$ gal. per min. Then, using a column pipe having a diameter of $d_c = 0.25\sqrt{600} =$ say 6 in., the velocity head in a pipe of this size may be ignored, and the effective head under which the pump must operate is

$$h_1 = h + \frac{G^2 h}{800\, d_c{}^5} = 600 + \frac{600^2 \times 600}{800 \times 6^5} = say\ 635\ ft.$$

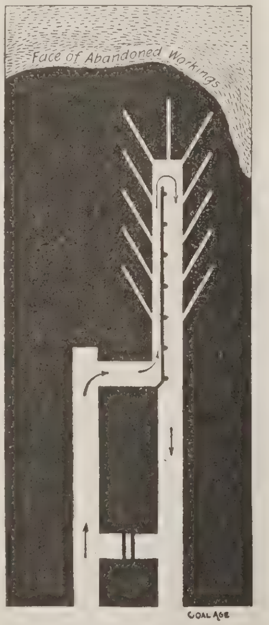
Then allowing 15 ft. for a sump, the total head is $635 + 15 = 650$ ft. Finally, assuming the efficiency of the water-end of the pump as 75 per cent., the required horsepower is

$H = 0.00034\, Gh_1 = 0.00034 \times 600 \times 650 =$ say 135 hp.

Ques.—A place is approaching old workings containing water. How would you work it, having due regard to safety? Describe some method whereby you could control a flow of water through a borehole.

Ans.—When approaching old workings containing water, a single heading should be driven in advance, as shown in the accompanying figure. A drillhole should be kept 20 ft. in advance of the heading, and flank holes should be driven in each rib, at an angle with the heading, about 2 yd. apart. A brattice should be erected from the last breakthrough to conduct the air current to the face of the heading, as shown in the figure. A sharp lookout should be kept for the first appearance of water or gas, and plugs should be kept ready for use in case one of the boreholes tapped the water in the old workings. Only safety lamps should be employed in this work.

In general, a plug driven well into the mouth of a hole will be sufficient to stop the flow of water. In case, however, it is desired to allow this water to drain from the hole and to control the flow, a heavy cross-timber should be set firmly into the rib, in front of the hole, and so arranged as to give the needed support to a pipe inserted into the hole. This pipe should be provided with a suitable cock to control the flow of the water. The end of the pipe inserted into the hole should have a slightly conical shape so that it can be driven tightly into a hole in the plug and form a watertight joint.



A PROSPECT HEADING

Ques.—Describe the operations in advancing a working place in a longwall face.

Ans.—In longwall working, when a miner enters his working place in the morning, his first duty is to examine carefully the condition of the roof and face of the coal and to reset any timbers that may have been displaced by the falling coal during the night. Having made the place safe for work the next step is to load out the coal, breaking those pieces that are too large to be loaded into the mine cars. Any loose slate that has fallen with the coal is thrown aside to be used for building packwalls.

Having loaded all the fallen coal and cleaned up the face, any new timbers required should be set in position. The work of undermining the coal should then be commenced, setting the necessary sprags and timbers as this work proceeds. After the coal has been undermined, all tools should be removed from the face to a safe place. Any back timbers may now be taken out and the packwalls extended as required. Before leaving the place for the night, the miner draws all sprags or other timbers supporting the coal at the face so as to permit the gradually increasing roof pressure to break down the coal during the night.

Ques.—A mine map shows that at one point in an entry the elevation is 742.5 ft. and at another point 100 yd. distant it is 748.5 ft. What is the average grade between these two points, (*a*) expressed in percentage and (*b*) expressed in inches per yard?

Ans.—The difference in elevation, $748.5 - 742.5 = 6$ ft., is the vertical rise of the entry in 100 yd. or 300 ft.

(*a*) The percentage of grade is, therefore, $6 \times 100 \div 300 = 2$ per cent.

(*b*) The rise is $6 \times 12 = 72$ in. in 100 yd., or 0.72 in. per yd.

Ques.—What quantity of water is contained in a sump 100 ft. in length, 7 ft. 6 in. in width and 5 ft. 3 in. in depth?

Ans.—The cubic contents of this sump is $100 \times 7.5 \times 5.25 = 3937.5$ cu.ft. The capacity of the sump if filled with water is then $3937.5 \times 1728 \div 231 = 29{,}454+$ gal.

Ques.—Humidity tests show that the percentage of saturation in the intake air is 40 and the return air 90. Parts of the mine being dry and dusty, what action would you think necessary?

Ans.—The question is not complete as it does not state the temperatures of the intake and return air without which no intelligent answer can be given. Intake air at 80 deg. F. and 40 per cent. humidity holds as much moisture as return air at 55 deg. F. and 90 per cent. humidity, which would not indicate any drying action of the air in passing through the mine. But an intake temperature equal to or greater than the return shows the need of humidifying the intake air.

Coal and Coke News

Harrisburg, Penn.

Ten of the largest and strongest casualty insurance companies of the United States have pooled their interests for the insurance of coal mines. In order to reduce to a minimum the risk of these companies, especially from the catastrophe hazard, they have organized as their medium of operations a Department of Inspection and Safety, and this has fixed its headquarters in Pittsburgh.

The offices of the associated companies have been opened in the First National Bank Building, and from these the inspectors and the consulting engineers of the Insurance companies doing business in coal mines in the state will direct their examinations of mines and coöperate with the insurance companies in fixing schedules or merit rates whereby a reduction in premium may be earned by any mine for every improvement which it may make for the safety of its operation.

It is expected that about Oct. 1 the State Compensation Board will announce the details upon which employers of labor may insure themselves against liability under the workmen's compensation act which goes into effect on Jan. 1, 1916. The regulations themselves will be most stringent. Whether the employer has a large or a small force of workmen, whether he is engaged in business alone or is part of a great corporation, whether he is backed with large or small capital, the paramount object is to make sure that in case of accident to an employee he or his beneficiaries will be compensated according to the law.

The proposal made that the employers that come under the act combine in a mutual enterprise, to make insurance as cheap as possible, has not yet been decided upon, but there is no doubt that out of it will grow an immense private corporation sustained by fixed contributions paid in by the members. The State Board, which consists of the Attorney General, Insurance Commissioner and State Treasurer, will see that the rates of payment will be sufficient to guarantee the solvency of the fund at all times. The state will make protection as liberal as possible. It will not permit extortion nor unreliability in any way. Aside from permission for the organization of private associations, the state will sanction the solicitation of business by regular insurance concerns unaffiliated with other businesses; it will permit a single employer to maintain his own insurance fund under adequate guarantee; and the state itself will establish a fund at rates that will enable employees to insure themselves at the lowest possible cost.

Details will be announced in time to give all employers abundant opportunity to study them and to decide which plan they prefer. The Compensation Board will profit by the experiences and mistakes of other states. Ohio seems to be regarded as the premier state in the compensation line, and it is likely that the Pennsylvania Board will consult considerably with officials from Ohio. Other states will also be consulted.

It is understood to be the desire of the Governor and of all concerned that no time be wasted in costly experiments, but that Pennsylvania shall examine the work in other states and begin at the point at which the pathfinders of those states have arrived.

PENNSYLVANIA

Anthracite

Middleport—The eastern Pennsylvania Collieries Co., a small company operating a colliery near Middleport, has closed its works, following a period of hardships, due to fire and a flooded condition of the mine which could not be overcome.

Tamaqua—The second annual field day and first aid meet of the Wentz allied companies comprising the Maryd, Hazle-Brook, Upper Lehigh, and Midvalley collieries, will be held at Hazle Park, Hazleton, on Aug. 27, 1915. Eleven teams will contest for the handsome trophy cup which was won last year by the Upper Lehigh inside team. The cup must be won three consecutive years to become the permanent property of the winners.

After extensive drilling operations the officials of the Silver Creek colliery, Philadelphia & Reading Coal & Iron Co., are convinced that there is no danger to their workings from the accumulated water in the abandoned Alliance colliery which adjoins their property, and which gave them some concern, due to the large body of water which has found its way into the idle mine.

The Black Ridge colliery of the Hazle Mountain Coal Co. has been abandoned and the company is selling the complete equipment. The officials of this firm, which is a branch of McTurk & Co., will go with the latter company to a new operation near Girardville.

Chauncy—Lightning hit the headhouse of the Gaylord colliery during a recent storm, and but for the prompt action of several of the employees doing night work it might have been destroyed or badly damaged. Employees are accustomed to take part in fire drills and the knowledge thus gained came in handy. The company maintains fire hydrants and several hundred feet of hose on the premises, hence it was but a few minutes before several strong streams of water were playing on the headhouse. Carpenters were put to work forthwith to repair the damage and the colliery worked as usual the next day.

Shenandoah—A recent button strike which threw 1000 men and boys out of work for four days at the William Penn colliery of the Susquehanna Coal Co. has been amicably adjusted by the miners' union and the men have returned to work.

Hazleton—The mining companies are rapidly disposing of their real estate holdings, other than actual coal land. Some time since A. Pardee & Co. sold all of the company houses which for years it had rented to the miners. This firm was soon followed by the Lehigh Valley Co. taking the same action, disposing of 24 houses to a manufacturing corporation.

Pottsville—Madeira, Hill & Co., of Philadelphia, is rapidly extending its coal operations in the Schuylkill district. Next week it will place in operation the new Black Creek colliery, which will have an output of 1000 tons daily and give employment to 500 people.

The present summer has been an exceptionally wet one in the anthracite region and instead of the mining companies being compelled to haul water long distances for boiler supply, as in previous years, they have been put to additional trouble and expense to keep the mines clear of the excess water. The past week the rainfall was particularly excessive and many of the collieries are in danger of being flooded out.

Pittston—Improvements are being made in the old air and pumping shaft of the Pennsylvania Coal Co. at the foot of Broad St. These improvements were started some time ago. The shaft, originally a small one, has been enlarged to 10x20 ft. and sunk to the lowest vein, after which concrete walls were constructed from the rock to the surface. A cap has been placed on the concrete walls bringing them up to a point somewhat above the level of the ground in preparation for the erection of a new steel tower in place of the old wooden structure that stood over the shaft for many years.

After working little more than half time for the last two months, collieries of the Lehigh Valley, Pennsylvania and Hillside Coal & Iron companies went on a full schedule this week and will continue to work steadily for an indefinite period.

Lansford—The report is current that the Lehigh Coal & Navigation Co. intends shortly to start washing coal from the immense culm banks in this vicinity and at Coaldale and Nesquehoning. This will mean work for quite a number of men who have been idle for some time.

Bituminous

Indiana—During a cloudburst the waters of a small stream rose so rapidly that they flowed into the mouth of the Sample Run mine, endangering the lives of the 450 miners working therein. The regular exit being cut off the men floundered about in water up to their necks for almost a mile, when they reached an air-shaft and climbed to safety. The mine will be idle for two weeks until the water can be pumped out.

Irvonia—Inability to secure prompt shipment of lumber for work on rebuilding the tipple at the Evans plant of the Evans Coal & Coke Co. has delayed work on construction so that it will probably be a month before the improvements that have been going on at that place for the past six weeks will be completed. Of the improvements planned, the air shaft and the gasoline haulage system have been completed. The total work will entail an expenditure of approximately $10,000.

Lynn Station—Orders have been issued by the American Connellsville Coal & Coke Co. for the firing of the entire plant at American No. 2, located at Lynn Station. This is the old Francis No. 1 plant of the Sunshine Coal & Coke Co. and consists of 240 ovens. For some time past repairs have been made in order to have the plant ready to fire.

Pittsburgh—The towboat "Exporter" recently left Pittsburgh with 6 barges of coal containing about 90,000 bushels, and one barge of manufactured steel for the Louisville market. The stage of the river was rather low.

Connellsville—During the recent past, a number of furnaces have required repairs. This has curtailed the fuel shipments from the Connellsville region and thrown considerable coke back upon the producers. It is considered that this condition is, however, only temporary. About ¾ of the available ovens in the district are in blast and indications are good for a further increase in the production.

WEST VIRGINIA

Fairmont—The Annabelle plant of the Four States Coal Co. has been closed, but it is believed will resume operation shortly. This plant employs about 800 men, and a temporary shutdown for repairs and to allow of certain changes in the arrangement of the mine and the policy of the operating company was necessary. It is believed, however, that this plant will be operating at full capacity again in a short time.

MARYLAND

Cumberland—The largest wheatfield in the State of Maryland is said to be owned by the Consolidation Coal Co. This field contains 128 acres and lies adjacent to the old national pike between Cumberland and Frostburg. It was cultivated under the supervision of Louis Rase, farm superintendent of the company, and the yield of grain is said to be extraordinarily heavy. The development of this farm by a coal mining company is being carefully watched by farmers throughout the state.

ALABAMA

Birmingham—The coal operators of the Birmingham district are interested in the bill before the legislature giving the state jurisdiction over the Mobile docks. This will affect shipping of coal from Birmingham but whether favorably or unfavorably is not yet determined by the coal men.

Governor Henderson has assembled a mass of information on the subject of taking the convicts out of the coal mines and lumber camps, and has sent a special message to the legislature. He is opposed to the bill now before the legislature which provides for the removal of convicts from the mines. The bill is being vigorously seconded by the miners.

Jasper—The Sunlight Coal Co. is now operating mines near Jasper by the stripping process. The coal is of excellent grade and lies from 5 to 15 ft. below the surface of the ground. Shipping will be begun in about two months. The stripping of coal deposits is a new method of coal mining in Alabama.

KENTUCKY

Middlesboro—News reaching here is to the effect that 300 employees of the Catron's Creek Coal Co. have gone out on strike, demanding recognition of the recently formed union and reinstatement of two men who, it is alleged, were discharged as a result of their activity in unionizing the camp.

OHIO

Columbus—The Piney Fork Coal Co. of Columbus, which is developing a stripping operation in Jefferson County, Ohio, 12 miles west of Steubenville, has been delayed to a large extent by the excessive rainfall during the past two months. The work of laying the permanent tracks and switches is progressing as fast as possible under the circumstances. According to General Manager J. W. Blower the operation will not be ready before Sept. 10. The huge steam shovel is completed and on the cars for shipment to the operation.

Monsarrat Bros., of Columbus and Corning, are arranging to market their product direct instead of through jobbers as has been the case in the past. The company has an office in the Hartman Building in Columbus.

Cambridge—The trouble at the Little Kate mine of the National Coal Co., located in the Cambridge district has been settled and work was resumed Aug. 9. The trouble arose over lack of safety arrangements. The company has agreed to build an interior opening and the Ohio Mining Department extended the time for completing the opening for 30 days. About 150 men are employed at the mine.

Brilliant—When the property of the Dexter Coal Co. of Brilliant, Ohio, was offered for sale in a bankruptcy proceeding by Receiver J. C. Ault, there were no bidders and the property will be readvertised.

New Lexington—The announcement is made that a number of Hocking Valley mines have been closed down indefinitely because of lack of demand for Ohio coal. The operations closed recently were Mine No. 266 at Hollister, Ohio; Mine No. 254 at Jacksonville, Ohio, and Mine No. 268 at Rendville. About 800 men were thrown out of employment.

ILLINOIS

Carlinville—A hearing is in progress in the Macoupin County Circuit Court in the injunction suit brought by the Superior Coal Co. against Louis H. Miller and others to restrain them from drilling oil wells through the coal rights of the Superior company. The question at issue is whether the coal company's rights apply to all minerals, including the oil-bearing sand. A temporary restraining order has been issued. The coal company contends that drilling through the coal veins will damage the property and cause great loss. The fear is that gas pockets would form and there would be explosions. The coal company asks that if the boring for oil is permitted to continue, it be compensated with $\frac{1}{16}$ of the oil findings. A large number of witnesses have been called and the hearing is expected to continue several days.

Percy—The Willis Coal & Mining Co. has discontinued operations at three of its mines and is operating only one. The company finds that it can buy coal in the open market to better advantage, at the current prices, than it can mine it, and is filling its contracts in this manner.

Belleville—Stephen Krezo has been brought here from Marissa, Ill., to have his mental condition inquired into. He was entombed in the Royalton, Ill., mine Oct. 27, 1914, when 58 miners were killed by an explosion, and it was four days before he was rescued. His mind is said to have been affected by the experience.

COLORADO

Denver—All the large coal companies in this state with the exception of the Colorado Fuel & Iron Co., have organized a mutual insurance company to carry the indemnities imposed by the new workmens' compensation law which went into effect Aug. 1. The Colorado Fuel & Iron Co. has arranged with the state authorities to carry its own insurance. The mutual company will write insurance for its various members at the rate of $4.60 per hundred dollars of payroll. It is expected that, unless unusual disasters occur during the first year of the experiment, the company will find it possible to considerably reduce this premium. Since no profit is contemplated from the maintenance of this insurance company, it seems reasonable that it can conduct its business and meet all ordinary obligations at a much lower rate of premium than can the regular insurance concerns.

Trinidad—The annual first aid contest of the Victor-American Fuel Co. coal camps will take place at Walsenburg on Aug. 28.

The Colorado Fuel & Iron Co. is completing the erection at Sopris of a modern clubhouse for the miners and a domestic science department and gymnasium building for the school.

Delagua—Delagua and Hastings, the two largest properties of the Victor-American Fuel Co. in the Trinidad district, began working full time the week beginning Aug. 8. About 50 additional men will be employed. Old coke ovens which have not been burning since the strike was called in September, 1913, will be put in operation.

FOREIGN NEWS

Havre, France—Miners in the Mons District recently went on strike, according to reports received at Havre. Groups of these miners had friction with German soldiers and a serious riot followed, during which two Germans and several miners were killed. It is reported that intense unrest prevails throughout the Mons District.

Toronto, Ont.—The Dominion Coal Co., of Sydney, N. S., is negotiating with the Intercolonial Ry. for the transportation by rail of a large tonnage of coal to Quebec and Montreal. There is a marked scarcity of vessels for the St. Lawrence trade and as there is a considerable shortage of railway freight it is probable that a satisfactory arrangement will be effected.

London, England—The Foreign Office, through a statement, recently explained that the order prohibiting the exportation of coal to other than British possessions did not signify a total prohibition of the trade. Firms making shipments to such places hereafter will be required to obtain a special license. It is said that this order was necessary because of legislation regulating the price of coal in Great Britain.

Edmonton, Alta.—At the annual meeting of the Edmonton Standard Coal Co., Ltd., on July 30, it was decided to remove the headquarters of the company from Toronto to Edmonton. General manager, W. M. Munns stated that owing to a rise in the Saskatchewan River the old workings had been abandoned and that work had been commenced in sinking a new shaft on the north side of Rat Creek, near the railway, which would improve the company's transportation facilities. A bond issue of $50,000 will provide the funds required for machinery and equipment.

PERSONALS

William G. Polk, secretary of the Hazard Coal Co., with offices in the Paul Jones Building, Louisville, has been elected as the coal mining member of the Louisville Rotary Club.

W. J. Jenkins, president of the Western Coal & Mining Co., president of the Union Fuel Co., and vice-president of the Consolidated Coal Co., St. Louis, has gone on an extended vacation trip.

Robert D. Reeves, assistant general freight agent of the Illinois Central and Yazoo & Mississippi Valley railroads, has been named vice-president and general manager of the W. G. Coyle Coal Co. at New Orleans, following a plan to enlarge and develop the operations of the latter company in that port.

Edward Barlow, who was formerly with the Montgomery County Coal Co. and more recently was proprietor of the Herrin (Ill.) Journal, has disposed of his newspaper and taken a position with the Lumaghi Coal Co. at St. Louis. He is a son of Harry Barlow, superintendent of the Black Briar Mine at Johnston City.

John W. Gates of Welch, W. Va., has been appointed district mine inspector of the Fourteenth District of that State with headquarters at Williamson. Mr. Gates succeeds P. P. Kerr, who resigned recently to accept a position as mine superintendent for the Yukon-Pocahontas Coal Co., Yukon, W. Va. Mr. Gates is a practical mining man of wide experience, and well fitted for the position which he now holds.

R. Y. Williams, formerly director of the Illinois State Miners and Mechanics Institute, has been appointed safety engineer for the Delaware & Hudson Co. This is a new office in the anthracite coal region. Another new office is that of efficiency engineer for the same company, to which A. E. Lister has been appointed. C. A. Straw has been appointed mechanical engineer and M. A. Walker, assistant mechanical engineer for the same company. These four offices have been created instead of filling the position of the late C. C. Rose, general superintendent.

OBITUARY

Alexander Dempster, aged 79 years, his wife and his chauffeur, were instantly killed in an automobile accident on Aug. 2, while his son, James G. Dempster, aged 32 years, was severely injured. The family were returning from Baltimore, Md. They were motoring through the mountains and the chauffeur was hurrying to reach Ligonier before a rapidly approaching storm. The car had just passed the Mountain Inn at Ligonier, when it careened to one side, struck a huge oak tree and plunged over the embankment carrying the occupants with it. Mr. Dempster was born in Scotland and came to Pittsburgh in his youth. He served in the Union army during the Civil War. Returning to Pittsburgh he became a civil engineer. Later he became interested in the western Pennsylvania coal industry, acquiring several mines which he operated independently with great success. Some years ago he disposed of his holdings to the Pittsburgh Coal Co. and became a director of that corporation. At another time he was a director and president of the Monongahela River Consolidated Coal & Coke Co. His interests were numerous and scattered of recent years as he became an investor in lead and zinc mines in Missouri and in timber tracts and stone quarries. He was one of the oldest members of the Duquesne Club. Mr. Dempster is survived by four sons, James, Arthur, Samuel and D. M. Dempster, and one daughter, Mrs. E. Bruce Hill.

Locomotive Boiler Furnace. F. F. Gaines, assigner to American Arch Co., New York, N. Y., 1,138,060, May 4, 1915. Filed July 24, 1913. Serial No. 780,968.

Apparatus for Cleaning Smoke Tubes of Boilers. C. H. Shepler and J. W. Shearer, San Francisco, Calif., 1,139,911, May 18, 1915. Filed Mar. 24, 1914. Serial No. 826,952.

Fuel Feeding Apparatus. R. Niedergesaess, assignor to American Smokeless Burner Co., a corporation of Washington, 1,139,708, May 18, 1915. Filed Jan. 15, 1914. Serial No. 812,254.

INDUSTRIAL NEWS

Birmingham, Ala.—Six barges have been chartered by the Tennessee Coal & Iron Co. from the Alabama & New Orleans Transportation Co. for the transportation of coal down the Warrior River.

Harrisburg, Penn.—The Bureau of Anthracite Statistics reports that approximately 1,350,485 tons less of anthracite were shipped to market in the first six months of this year than during the same time in 1914.

Philadelphia, Penn.—The Pennsylvania R.R. for the month of July has reported an increase in the loaded car movement, in which shipments of bituminous coal eastward have contributed to the extent of 1.9 per cent.

Maxine, Ala.—The Pratt Consolidated Coal Co. has been receiving orders so rapidly that it has put on a night shift as well as a day shift on the steamer "M. Carney," which is used in towing coal barges from Maxine to Mobile.

Philadelphia, Penn.—The export of coal to foreign markets shows a considerable increase from this port during the past month. Exports of anthracite and bituminous amounted to 171,027 tons as compared with 59,855 tons shipped during the same period of last year.

Mobile, Ala.—The Mobile Coal Co. recently awarded a contract to the Slidell Dry Docks & Ship Building Co. of Slidell, La., for the construction of six barges, to be used in the Warrior River coal trade. The new fleet will be towed by the steamer "Martha Hennen," plying between the coal mines and Mobile.

Washington, D. C.—The Interstate Commerce Commission has announced a further suspension, from Aug. 30 until Feb. 29, of the Chesapeake & Ohio tariff which provides for an increase in rates on bituminous coal, carloads, from West Virginia to certain points in Kentucky. The previous suspension was from May 2 until Aug. 30.

Denver, Colo.—Denver & Salt Lake R.R. (formerly the Moffatt road) has been denied a petition for a rehearing in recent rulings of the state public utilities commission whereby freight rates on coal from the northwestern Colorado coal field to the eastern state line were materially reduced. This affects shipments to Kansas and Nebraska points.

Scranton, Penn.—It is stated that the large armory of the National Guard in this city is in danger of sinking into a mine which underlies the land on which the structure has been built. In order to overcome the difficulty the state authorities have decided to partly fill the old working and support the roof with massive concrete abutments.

Huntington, W. Va.—The Chesapeake & Ohio Ry. broke its coal-loading record in July by almost 8000 tons. The total loading for the month on the system was 2,224,020 tons. The best record of any previous month was established in August, 1914, by the loading of 2,216,460 tons. It is thought that this record for one month may be again broken in August.

Pittston, Penn.—Dredging coal deposits from the bed of the Susquehanna River has never been successfully undertaken north of Wilkes-Barre, but the Citizens Electric Illuminating Co. has purchased an equipment and plans to remove coal from the river bed just south of the Lackawanna River outlet. A centrifugal pump driven by a vertical engine will be employed.

Philadelphia, Penn.—Since the British Government has issued its Orders in Council prohibiting any exports of coal after Aug. 30, except to the colonies, the shippers of bituminous coal from this port expect to share largely in the increased demand from abroad, especially from those countries who as allies have been able to secure shipments from Great Britain.

Meadville, Penn.—It has been announced that the Phoenix Iron Wks. will be materially enlarged. Permission has been granted for the company to increase its capital from $200,000 to $300,000 for the purpose of enlarging the plant and increasing its output. It is proposed to develop to full capacity the plate or tank shop, the foundry and the boiler shop. It is estimated that the monthly payroll will be increased by at least $5000.

Pittsburgh, Penn.—James S. Boggs and Charles W. Theis were recently appointed receivers of the Meadowlands Coal Co. by Judge A. B. Reid. The appointment of Mr. Theis was made after a conference between counsel for the bankrupt company and the creditors. The former receiver was appointed permanently, having served for several weeks as temporary receiver. The Court fixed the bonds of the receivers at $10,000 each.

Spokane, Wash.—Reports reaching here from Glacier, Washington, state that a coal strike has been made by Albert Vaughan who has organized the Bituminous Coal Association. The vein is said to be 27 ft. wide at the outcropping. The Washington Anthracite Coal Co. is reported to have made the discovery of good coal on its property near Glacier. The vein is said to be 14 ft. at the lower level, 1400 ft. below the surface. There is 2000 ft. of tunnel at this level.

Baltimore, Md.—Railroads entering this city are rushing equipment orders and rolling stock that is not needed for immediate use is being repaired and put in good shape. The Pennsylvania R.R. will within a few days begin the construction work on a new coal pier, and the Baltimore & Ohio has about completed plans for a large new pier to supplement the present one at Curtis Bay. The pier now in use has an extreme loading capacity of 1000 tons per hour on each side.

Fairmont, W. Va.—Contract for the construction of the Helens Run Ry. from the Baltimore & Ohio at Worthington to the Helens Run coalfield, a distance of about 6 miles, has been let to A. L. Anderson & Bros., Inc., of Altoona, Penn. Men have already been put to work along the recently surveyed line for the purpose of preparing for grading and bridge building, which will start shortly. Several hundred men will be employed in the construction work which will be pushed as fast as possible.

Philadelphia, Penn.—Foreign shipments of coal from here during July showed an increase of more than 50,000 tons over the same month of last year, according to the monthly report of the statistician of the Commissioner of Navigation. His report showed that during the last month 171,127 tons of anthracite and bituminous coal were exported, as compared with 59,855 tons during July, 1914. Shipments of coal to coastwise ports during the month amounted to 259,788 tons, as against 266,270 tons in the corresponding month of last year.

Philadelphia, Penn.—The Philadelphia & Reading Coal & Iron Co. has libeled the steamship "Concord" of the Colonial Line for $70,000 damages. This sum the company claims represents the loss of the barge "Exeter" and the 2900 tons of anthracite with which the boat was loaded when struck and sunk by the steamer on July 31. The papers were served against the Concord while at her pier in Providence, R. I., and the owners were compelled to file a bond of $100,000 to procure the release of the boat in order to fulfill the regular sailing schedule to New York.

Denver, Colo.—A settlement has been effected by the Government with the American Smelting & Refining Co. in a case which has long been pending in the United States Court. The cash sum of $112,766 was paid to District Attorney Tedrow and forwarded to the Federal Government, being payment for coal actually taken from the mines at Aguilar and Cokedale, which are said to have been obtained from the Government through fraud. A total of 3475 acres of valuable coal land has also been returned from the company to the United States Government on the ground of having been obtained fraudulently.

Connellsville, Penn.—The Consolidated Connellsville Coke Co. recently shipped 5550 tons of furnace coke consigned to New York docks where it will be loaded for shipment to South America. Negotiations for the shipment of 40,000 tons of Connellsville coke are pending, and will probably be closed during the current month. The contract already shipped is the second consignment which the Consolidated Co. has handled in the past two months, the first cargo being 4500 tons sent in the early part of June. While the first cargo went to the Argentine, the present shipment is understood to be consigned to Chile.

Portland, Me.—President W. L. Connell, of the Lackawanna Coal & Lumber Co., recently asked a group of bondholders to forego the interest for two years on their bonds, to extend the notes given for interest due last October, and also to contribute a six per cent. assessment on their stock. This meeting is one of a series that is being held all over the country where groups of bondholders are located, to counteract the projects of an element which does not hold with the plans of the present management. The outcome of such agitation President Connell pointed out might be a receivership and forced sale under the hammer. He contends that the property is the most valuable of its kind in the world.

Bismarck, N. D.—The state railroad commission recently heard arguments on the lignite coal rate case in this state. The various railroads interested in coal rates, as well as mine operators were in attendance. Attorneys for the Soo railroads presented evidence to show that the present rate which the operators claim is excessive is only reasonable. They presented a complete statement of all their business for 1914. Attorneys for the Northern Pacific also held the present rate to be reasonable and gave a brief outline of the effect of the recent supreme court decision on the railroad business. The railroads will submit further data to the commission before a decision on the lignite rate is returned. A comparison will be made with rates in other states, which will be submitted by the attorneys for the various roads.

Connellsville, Penn.—The H. C. Frick Coke Co. is instructing its firemen and boiler house attendants in the principles of economy and efficiency. The study classes of this company, which have been conducted for the past three years will hold a series of meetings throughout the plants of the Connellsville region to continue education along these lines. According to the plan which will probably be adopted, the boiler house men from four or five plants will meet at some central point, there to discuss boiler house problems and receive instruction in the economic use of fuel. Experienced fuel experts will meet with the men, giving short talks on the subject of fuel economy as well as conducting investigations into the question of better boiler house practice. I. C. Kelly, master mechanic of the company, and R. C. Lyon of Connellsville, will have charge of this work.

Philadelphia, Penn.—An interesting and well vouched for story is going the rounds of the bituminous trade here. It was all due to the efforts made on the part of some shippers to secure the coal trade of Italy since England has shut off all exports. One of the large Philadelphia shippers was particularly anxious to secure the contract for supplying one of the government railways in Italy and for that purpose paid a visit to Rome. On the very day he arrived he was caught in an immense throng surging toward the street and when he got to a position of vantage found it was the King's automobile that had caused the commotion. And alongside of Victor Emmanuel sat E. J. Berwind, of the Berwind-White Coal Mining Co., of Philadelphia. Mr. Berwind probably was not talking shop to the King at the time, yet the other Philadelphian concluded that anybody who expected to beat Mr. Berwind would have to be extra swift, so he came home at once.

Philadelphia, Penn.—An interesting fact disclosed in the annual statement of President Thomas was that the Lehigh Valley Coal Co. mined 258,205 tons of bituminous coal last year, being a slight increase over the previous year. This coal, of course, was not mined on the line of the Lehigh Valley R.R., as none of the socalled anthracite roads has direct access to bituminous mines. While the above is not a large tonnage, it is of interest when it is considered that with this exception no other large anthracite company has ever engaged in the mining of bituminous coal. About 15 years ago the late George F. Baer purchased a large bituminous property in Somerset County, which it was reported was to be reached by a line from Shippensburg. For some reason the projected line was never started and some years later the Reading company disposed of the holdings without ever having made an effort at development.

Coal Trade Reviews

General Review

Approach of fall season the only constructive feature in the anthracite situation. Slightly firmer tone in bituminous, though it is still a buyer's market. Exports continue to boom. Delayed buying at interior points expected to cause a congestion.

The approach of the fall season is the one constructive feature in the anthracite situation. It is evident that many long-deferred orders must be released shortly, but until this occurs no activity can be expected. At the moment only a rigid curtailment, particularly among the individual operators, has saved a general demoralization. The large demurrage bills, against even some of the big companies, is tangible evidence of how unusually dull the anthracite market has been. The better grade steam sizes are moving more freely and, while concessions by the individuals are still the rule, there is apparently not so much of this coal being placed. Some inquiries for anthracite exports are developing. The Lake shipments show a further increase, and the docks are more active than for a long time. At interior points like Ohio hard coal is being absorbed better than in previous years.

Eastern bituminous buyers are still proceeding cautiously, and the trade continues marking time, though consumers are possibly showing less disposition to hold out for bottom prices. However, it is distinctly a buyers' market. Occasional tonnages are still going at sacrifice prices, in order to avoid demurrage, and as liberal inducements can be obtained as at any time this season. Consumption and demand at line points are apparently better than at Tidewater.

The new British regulations, restricting exports still further, have stimulated renewed interest in the foreign business. In spite of the general tendency to belittle this business, it is clear that it is proving a potent factor in relieving the pressure in certain quarters. There has been another spurt in the demand for high-grade coal for export, and the volume now moving in this direction is sufficient to hold prices fairly even. Evidence of the heavy shipping is noted in the situation at Hampton Roads, where some companies continue having difficulty in getting coal forward fast enough to meet their obligations. The increased demand for grain steamers has stiffened rates in the off-shore trade, while coastwise vessels continue sensitive to the fluctuating demand for coal, some unusually high figures being noted.

There is a slightly heavier demand in the Pittsburgh district, but there is plenty of free coal still available, and quotations have not as yet been affected. While it cannot be said that there has been a positive turn for the better, the heavy operations at the steel mills are undoubtedly creating a better sentiment, and the operators are taking a somewhat different view as regards contract prices. Slack coal is notably stronger.

The improvement in the Ohio situation continues, although it is not very extensive, and buying continues conservative. The increase appears to be general in all directions; domestic demand is larger, while requisitions from manufacturing plants are increasing and the railroads are taking a greater tonnage in order to handle the heavier traffic. The unusually large crops have had a notably stimulating effect on the business outlook. The extremely light Lake movement continues the one acutely depressing factor in the situation. The unusually low prices recently in effect have apparently been wiped out.

Buying in the Middle West has been so generally delayed in all directions that there is danger of a serious congestion when the crops and coal start moving together, as must be the case very shortly; it is well established that stocks are small throughout the country districts, and when the buying opens up there will be a rush for coal. The heavy rainfalls over the early part of the month had a tendency to delay harvesting and seriously interrupted deliveries in the country districts. The rapid improvement in the iron and steel industries has been one of the most impelling constructive factors in the current situation.

A Year Ago—Business uncertainty has created a sharp buying movement in anthracite. Derangement in coastwise and foreign shipping has seriously disturbed the Eastern bituminous situation. Producers aggressively investigating the possibilities in the foreign markets. Sentiment generally better.

BUSINESS OPINIONS

Boston News Bureau—At the moment much of the good news has come out. The latest, the decision of the Interstate Commerce Commission in the Western railroad case, gives many increases, but not in every instance. The further heavy influx of gold from England is a feature. It is an encouraging sign to see England shipping gold here rather than establishing a credit. If she continues this policy she will gain prestige the world over. The situation is still one that puzzles the brightest. Conservative men are extremely conservative. They are not inclined to make large commitments and yet they are not loud in protest.

Iron Age—Active buying at advancing prices has centered attention on the pig-iron market. Steel-making pig iron has led in tonnage and has advanced $1 a ton in nearly all markets except Chicago. Thus the heavy demand for openhearth steel which caused so abrupt a rise in billets is now also the dominant factor in pig iron. Some excitement has been added to the situation by a reported purchase of pig iron at Cleveland by the Steel Corporation, but confirmation of this report is lacking.

American Wool and Cotton Reporter—It was a comparatively big week in the Boston wool market, with sales of 6,310,000 lb. More medium wools were sold than for the previous week. Prices are a shade firmer. That the market is in for a period of high value is the feeling practically throughout the trade. Trading seems to be pretty general on both domestic and foreign wool. There has been some speculation in noils in anticipation of army contracts.

The Government Crop Report—The Government crop report as of Aug. 1 is highly encouraging. The estimated production of corn, wheat and oats is placed at 5,286,000,000 bu., which compares with previous years as follows: 4,704,000,000 bu. in 1914; 4,331,000,000 bu. in 1913; 5,272,000,000 bu. in 1912 and 4,074,000,000 bu. in 1911. The production for the current year is 15% ahead of the average for the four preceding years and is worth approximately a half a billion dollars more than the average for the past three years. With the Dardanelles closed against Russian export the demand for our grain will also be of such proportion as to assure a very satisfactory price.

Duns—Commercial progress would be more uniform were it not for the vagaries of the weather, especially in the East. Confidence, however, is not shaken by influences of a temporary nature, and apart from these handicaps, developments continue mainly on the constructive side. Rarely have fundamental conditions been as sound as at present, and knowledge of this fact leads to the conviction that nothing is likely to permanently check the revival of general business activity. More shoe factories are running close to capacity and there is a noticeable revival in the wool industry.

The Southern Lumberman—Reports from the several yellow pine manufacturing territories and from the consuming markets are more uniform and more optimistic this week than at any time within the past two months. Stocks at the mills and on yards of both wholesalers and retail dealers are to some extent broken. The volume of hardwood business for July, while not what might have been desired, was nevertheless fairly satisfactory.

Marshall Field & Co.—The month of August has started with a substantial gain in shipments as compared with those of a year ago. The "market week" and "style show" brought a large attendance of buyers from all sections of the country. Weather conditions have been decidedly unfavorable to retail selling. Collections are good.

Bradstreets—Basic conditions continue to improve and feeling as to the future is more optimistic, but withal, conservatism, born of uncertainty as to results likely to follow a wet harvest, with some toning down of earlier exuberant crop estimates, is quite marked in grain-raising sections. So, on the one hand, country buyers are inclined to be cautious, while on the other, those hailing from metal manufacturing centers are more set upon going ahead.

ATLANTIC SEABOARD

BOSTON

Market very dull and receipts are being applied almost exclusively to contracts. Buyers recognize this as a favorable time to secure concessions. Georges Creek and Pennsylvania grades unchanged. Water freights variable. Anthracite business fair.

Bituminous—The Pocahontas and New River market is almost featureless. While the volume of coal moving off-shore is still large and is sufficient to hold prices fairly even there is almost no demand coastwise. There are perhaps fewer concessions heard than a fortnight ago, but that is due not so much to any firmer tendency as to the fact that shippers realize that even low prices will not stir up new business of any account. Receipts have been extremely light on account of the continued thick weather but now that cargoes are arriving it is seen that practically all are being applied to contracts.

Only a few orders are hanging fire and what buyers are in the market are proceeding very cautiously. Right now is probably as favorable a time as any this season for buyers to secure liberal inducements from most of the agencies. A few of the shippers with long established connections abroad did practically a normal business in July.

The abundant supply of water is a factor in the August dullness that prevails in New England. Many industrial plants will go light on coal for several weeks to come.

There is little news on Georges Creek. Loading for export has taken a spurt at Baltimore but otherwise the situation with the shippers is about normal for the season. There is no longer any difficulty about effecting prompt shipment.

The houses which handle the Pennsylvania grades are watching this market very closely with a view now to next year. There is an increasing disposition on the part of buyers to look into the merits of high-grade coals from the Pennsylvania districts and unless the present differential with Southern coals is reduced there is likely to be an expanding business in this direction another year.

Water Freights from Hampton Roads to Boston are quite sensitive to the fluctuating demand for coal. Sailing vessels are scarcely heard from except in the case of small coasters loading at New York, and barges and steamers are carrying practically all the coal; 75c. to Boston is quoted as the market on bottoms 2500 tons upwards; $1.25@1.50 has been paid on 500-ton vessels, New York to Calais and Eastport, Me., an unusually high rate.

Anthracite—The larger companies have a better supply of orders than was anticipated. Shipments are made promptly but there is enough business so that anthracite-carrying barges are not so easy to secure for bituminous loading. Individual shippers are still offering material concessions but very little of such coal has been placed here. Retailers are making exertions to get customers to accept deliveries now in order to relieve the congestion that is usual in the early fall.

Quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.15@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.40@2.85	2.92@3.02	
New York*	2.40@2.95	2.70@3.15	3.22@3.32

Boston†	....	....	....	3.50@3.63
Providence†	....	....	....	3.45@3.68

* F.o.b. †On cars.

NEW YORK

Some cheap bargains in bituminous. Export business continues large but bunkering is slowing up. Anthracite season advancing. Prices still rule substantially below the circular.

Bituminous—Opportunities favorable to the consumer continue to offer themselves through the agency of demurrage coal. Some cargoes have been sacrificed in order to escape further losses by car demurrage. There are generally times throughout the year in the bituminous market when this is true so that the condition is not a new one. The bunkering tonnage has naturally fallen off here and with mining continuing, even if on short time, some place must be found for the coal.

Fortunately the export orders have come to the rescue and while a great deal is said about the bluff of this business it is nevertheless a fact that quantities of coal have been shipped to the belligerent nations and South American countries. It may be said that better prices are being obtained on this class of business than on the regular local contract supplies. The open market quotations prove too strong a temptation for the average consumer to overlook. Line bituminous out of New York is holding up well. The holders of contracts there seem to be scrupulous and their draughts on their allottments are normal.

Current quotations are on the following basis:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.30@3.40	$3.30@3.40	$3.30@3.40	$1.75@1.85

Steam		2.45@2.50	2.45@2.50	.90@ .95
Western Maryland		2.35@2.40	2.35@2.40	.80@ .85

Anthracite—There remain but a few weeks more before there will be an evident stimulation in the market. With August half over this much needed change cannot be further away than the week following Labor Day. There are orders on the books of the retailers, some of which date back to April, which will surely have to be filled in September. When these orders are received the retailers will begin to buy but not until then.

Mining operations have been limited to two or three days each week at most of the collieries. This is also true of some of the individuals. Lake shipments require the bulk of the prepared sizes now being produced and it is noted that each week's lake report shows a very satisfactory tonnage. Conversely the New York market absorbs the steam sizes, especially rice and barley. The better grades of these coals are in strong demand and prompt loading is out of the question. This situation will clear a little when full mining is resumed but the prospects are that there will be no over-abundance during the entire winter.

Pea coal is a drug at the present and is going into stock. There is no large accumulation of domestic sizes at the loading ports and there is little local demand, yet prices have held well. In some cases chestnut has sold lower than either stove or egg. Of the three stove may be said to be the leader.

Export inquiries calling for broken and steamboat coal receive little attention. The broken output is being absorbed on gas-house and manufacturing contracts and steamboat is unprofitable to produce.

Following are the average quotations af the week:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.95		$5.00	
Egg	5.20	$4.70@5.20	5.25	$4.75@5.25
Stove	5.20	4.90@5.20	5.25	4.75@5.25
Chestnut	5.45	4.85@5.45	5.50	5.05@5.50
Pea	3.50	2.70@2.95	3.50	2.75@3.00
Buckwheat	2.75	2.00@2.25	2.80	2.05@2.30
Rice	2.25	1.70@1.85	2.30	1.75@1.90
Barley	1.75	1.45@1.70	1.80	1.50@1.75

PHILADELPHIA

Anthracite continues dull, although some sizes are stronger. Cheap coals not so active, and pea shows slight tendency to tighten. Collections extremely poor. Bituminous quiet, but slack somewhat scarce. Exports continue to increase.

Anthracite—While the shutting down of the collieries, especially those of the individuals, is all that has kept the trade from being thoroughly demoralized for the past three or four weeks, this cessation of mining is being felt and there is probably less very cheap coal in the market than for some time, excepting chestnut, sales of even the smallest quantity of this still being reported at the April price. We know of one recent sale of 1200 tons of stove and 1800 tons of chestnut at April rates, the latter size making the order attractive; shipments on this order are to be made at the seller's convenience.

Broken and the steam sizes are being absorbed, while egg and stove are still causing little trouble, especially as it is reported that shipments to the New England market are improving. The pea coal situation is progressing rather favorably, although the individuals show little disposition to allow the large companies to secure the business at their price of $2 and tax. The former's price has advanced 10 or 15c. per ton in many instances, but is the same amount off what is now practically accepted as circular—the $2 rate. One of the reasons for the slightly improved business is the amount of coal being bought by various institutions in and around Philadelphia. This seems to be the season for laying in their supply.

The demurrage bills are coming in from the railroads for cars that were held at the scales pending disposition, and the shippers realize more than ever just what a dull siege they have been going through. While the smaller operators have been great sufferers in this respect, it is known that at least one of the largest companies has been penalized thousands of dollars. There are no "free lists" these days.

It is understood that considerable coal is being stored at Port Richmond piers for reconsignment when business braces up. This costs the shippers 5c. per ton to dump, 10c. per ton to pick up and 1c. per ton per month for storage.

Collections remain poor and probably will continue so until fall. A careful canvass of the trade shows that few can boast of any improvement. The circular prices, to which the state tax of 2½c. per ton should be added, are as follows:

	Line	Tide		Line	Tide
Broken	$3.40	$4.65	Pea	$2.50	$3.25
Egg	3.65	4.90	Buckwheat	1.25	2.25
Stove	3.90	4.90	Rice	.85	1.75
Chestnut	4.05	5.15	Barley	.50	1.50

Bituminous—The only noticeable feature of the market the past week was the tightening of slack coals. This was probably due to lack of demand for the three-quarter sizes and as a consequence had a tendency to raise the price of slack from five to ten cents a ton. Outside of this slight stir the market still seems to be marking time, although some quarters report a continuation of the increase in tonnage noted last week.

The trade is now looking toward fall when a real boost is expected. In the meanwhile the export business continues in increasing volume, especially so since the British Government has issued its Orders in Council prohibiting any exports at all effective Sept. 1, and the inquiries are now coming in, in greater numbers than usual. In this work the Government itself is assisting to some extent through our consular agents abroad, whose reports are printed and forwarded to the various mining interests. There is hardly an American consul who does not weekly report of opportunities to secure coal business.

The Commissioners of Navigation in their monthly report announce the shipment of 171,127 tons of bituminous coal to foreign shores as compared with 59,855 tons last year. Shipments to coastwise points amounted to 259,788 tons as against 266,270 tons in July of last year.

The current prices are as follows:

Georges Creek Big Vein	$1.65@1.75	Fairmont gas, mine-run	$1.15@1.25
South Fork Miller Vein	1.50@1.60	Fairmont gas, slack	.70@ .80
Clearfield (ordinary)	1.00@1.20	Fairmont lump, ordinary	.85@ .95
Somerset (ordinary)	1.00@1.15	Fairmont mine-run	.75@ .80
West Va. Freeport	.85@ .95	Fairmont slack	50@ .60

BALTIMORE

A slow improvement noted here. Export movement holds good. Anthracite dealers pushing in delayed deliveries.

There can no longer be a doubt but that business conditions are improving. There is a better line of inquiry, less haggling for bottom prices, and an increasing demand on contracts. There is still much to be desired but there is a decidedly better tone.

The remarkable export movement holds up in good shape. During July a total of 251,485 tons was loaded as cargo coal for foreign ports. For the first six workings days of August a total of 54,856 tons was put in foreign bottoms as cargo fuel, in addition to 7010 for bunker use. Prospects are that August or September will exceed July movement, the banner month, when 309,000 tons was sent out on export.

Anthracite men are showing more life and some fair orders are coming in mainly for early fall delivery. In the meantime that part of the trade is pushing in delayed deliveries wherever the opportunity offers so as to be free for the fall rush.

HAMPTON ROADS

Export shipments to Italy continue heavy. Coastwise movement fair. No change in prices. Dumpings for month of July reach the enormous figure of 1,562,330 tons, breaking all former records.

The movement from Tidewater piers during the week has not been as heavy as expected but there have been a number of large cargoes loaded for both coastwise and foreign ports. There is practically no change in prices although the demand continues heavy for export coal. The accumulation on the railroad yards is still somewhat light and a number of the shippers are having difficulty getting coal forward fast enough to take care of vessels promptly on arrival.

With the total dumping of the three piers at Hampton Roads amounting to 1,562,330 tons for the month of July, all previous records for heavy dumpings were broken. These figures are about 125,000 tons above those for June, which was the record month. As is usually the case the Norfolk & Western Ry. dumped more coal than the other two roads combined and while both the Chesapeake & Ohio and the Virginian showed an increase over their June figures the Norfolk & Western showed a slight decrease. The movement over the Norfolk & Western piers amounted to 825,910 tons, the Virginian 300,190 tons and the Chesapeake & Ohio 436,230 tons. Of the total July movement the largest percentage of the export coal was taken by Italy, a greater part of this coal being for the railways and navy.

Railroad Tonnages—Dumpings over the local piers for the past several weeks compare as follows:

	Week Ending				
Railroad	Aug. 7	July 10	July 17	July 24	July 31
Norfolk & Western	135,357	174,822	180,090	197,913	188,593
Chesapeake & Ohio	110,861	76,397	116,862	96,627	84,018
Virginian	64,397	57,467	78,710	86,523	39,335
Totals	310,515	308,686	375,662	381,063	311,949

OCEAN FREIGHTS

Plate freights are practically the same as a week ago and a number of charters were effected during this interval at or about recent quotations. Mediterranean freights are firmer owing to the increased demand for steamers for grain; Cuban and West Indian freights are also firmer on account of the scarcity of tonnage available for this business.

The freight market is now quotable as follows:

To	Rate	To	Rate
Havana	$2.75@3.25	Bermuda	**$3.00**
Cardenas or Sagua	3.00@3.50	Vera Cruz	3.25@3.75
Cienfuegos	3.25@3.50	Tampico	3.25@3.75
Port au Spain, Trinidad	3.50	Rio	8.40@8.64
St. Lucia	3.25@3.50	Santos*	8.40@8.88
St. Thomas	3.00	Montevideo	8.16
Barbados	3.50	Buenos Aires or La Plata	†8.16@8.24
Kingston	3.00@3.50	Rosario	8.40@8.64
Curacao	3.25	West Coast of Italy	9.36@9.60
Santiago	3.25@3.50	Barcelona**	8.64@8.88
Guantanamo	3.25@3.50	Valparaiso or Callao	6.50@7.00
Demerara	4.50@5.00	Marseilles	8.88@9.12

Note—Rates noted in **bold face** type are only approximate.

* Consignees paying dockage dues. ** Spanish dues for account. † Quotations on Plate coal by British steamers. Neutral steamers are more difficult to obtain and the rates are always higher. Neutral owners prefer Buenos Aires.

W. W. Battie & Co.'s Coal Trade Freight Report.

Note—Charters for Italy, France and Spain read: "Lay days to commence on steamer's arrival at or off port of discharge. 24c. per net register ton per day demurrage."

OCEAN CHARTERS

The following charters have been reported from various sources during the past week:

PHILADELPHIA

LAKE MARKETS

PITTSBURGH

Demand slightly increased and sentiment decidedly better, with contract prices a shade stiffer. Operations at 50 to 60% of capacity.

There has been a slightly heavier demand for coal, in the aggregate, but there is still plenty of free coal in the market and prices for prompt shipment are not sensibly advanced. The consumption of the steel trade is large and has increased somewhat even in the past week, while as the mills get into smoother running order and approach the cold weather it is likely the coal consumption of the industry will pass all records.

General business shows an improvement, and the local coal trade has become decidedly more hopeful as to the future, and somewhat stiffer in its views as to contract prices. The lake movement continues light and it is now doubted whether there will be any substantial increase in the rate of shipping at any time in the remainder of the season. The Pittsburgh district continues to turn out coal at between 50 and 60% of capacity. The demand on the Connellsville district for export coal is about the same as formerly.

Pittsburgh district prices for prompt coal remain substantially as follows: Slack, 50@55c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district. On contract to Apr. 1 mine-run is $1.05@1.15 and slack about 95c.

BUFFALO

Bituminous improving very slowly. No improvement in sight in anthracite. Some promised near the end of the month.

Bituminous—There is a steady increase in the demand, but it comes slow. The fall trade is expected to be good, though the promise is not very positive yet. Some of the Allegheny Valley operators are now running half time and others are complaining of unsold coal on track. The shippers agree that the demand comes in strong some days and then drops off almost entirely. There are a good many iron furnaces, some of them idle for years, that are starting up and they will force a general activity if they go on.

There is a perceptible improvement in the slack market. This was occasionally selling as low as 30c. a ton awhile ago, and now it sometimes brings 75c. This means that the very low figure is gone and will not return unless the market weakens again. Bituminous is still quotable at $2.70 for best Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack. Allegheny Valley sizes are 25c. below Pittsburgh. The slack has not been quite as strong lately as Pittsburgh slack, but it is reckoned on a par with it in price generally.

Anthracite—At present the Upper-Lake docks are not eager for cargoes, but the shippers are putting them in wherever they find room. The amount loaded here for the week again shows an increase, being 122,850 tons, which is a fair amount for midsummer. Some of the shipping docks are more active than they have been for a long time. It will be sometime before the city anthracite trade is active. Dealers have turned their attention to other business so far as possible and will let the trade take care of itself till fall.

COLUMBUS

Trade shows a little more activity in both domestic and steam lines. More stocking and retailers are buying to take care of the demand. Prices unchanged.

A slight improvement is reported during the past week. This is especially so in domestic circles where trade is increasing in volume. The tone of the market appears to be better all along the line and coal men generally believe that future prospects are brighter.

In steam lines there is also an improvement as manufacturing is growing better. Requisitions for manufacturing plants are larger and there is a tendency among purchasing agents to increase stocks. Railroads are taking a fair amount of fuel as the freight movement is increasing. Buying off the open market is still a rule in certain sections but some of the consumers are now showing a disposition to contract though only a few contracts are expiring. One of the best features is the absence of extremely low prices as was the case several months ago.

Threshing in rural sections is now at its height which means a large consumption of coal. Rural dealers have been hurrying up orders as they are selling more coal than usual. The wheat and oats harvests are unusually big.

Many of the larger domestic consumers in the cities are laying in their winter's supply of fuel and retail trade is active. There is a better demand because of the failure of natural gas in previous winters and householders are returning more and more to the use of coal.

The Lake trade is not very active as there is still a large quantity on the docks at the upper ports. The movement to the interior is slow. Many of the larger Lake producers are not taking any part in the trade as they do not wish to invest any more money.

The anthracite trade is more active in central Ohio territory. Many of the shippers report an increase of fully 50% in the demand as compared with previous seasons. This is especially true of certain residence sections of the larger cities.

Prices in the Ohio fields are as follows:

	Hocking	Pomeroy	Kanawha	Eastern Ohio
Rescreened lump	$1.45	$1.50		
Inch and a quarter	1.35	1.35	$1.30	$1.25
Three-quarter inch	1.25	1.25	1.25	....
Nut	1.15	1.25	1.15	....
Mine-run	1.05	1.10	1.05	1.00
Nut, pea and slack	.65	.70	.65	.60
Coarse slack	.55	.60	.55	.50

Mines have been working at about the following percentages of full capacity:

District	Week Ended July 17	July 24	July 31	Aug. 7	District	Week Ended July 17	July 24	July 31	Aug. 7
Hocking	25	25	15	25	Cambridge	35	25	30	30
Jackson	25	20	20	20	Masillon	30	25	25	25
Pomeroy	40	40	35	25	Eastern O.	50	55	50	30
Crooksville	20	20	20	30	Average	32	30	29	30

TOLEDO

Both steam and domestic markets slightly better. Crops injured by heavy rains.

The general improvement in the demand for coal continues though it is not extensive. The steam trade is showing some awakening although buying is very conservative. Many large concerns continue picking up bargain coal. There has been no indication here of any congestion nor does there seem to be any possibility of such a contingency. The heavy rains of the past two weeks has affected the crops noticeably.

The Lake movement is lighter than it was and it has at no time this season been up to normal. Pocahontas coal is still in good demand but it is claimed that there is some shading of the increased August prices.

CINCINNATI

Domestic business slightly improved, although buying is still in small volume. Steam demand dull.

While the movement of the prepared grades is not up to normal, there has been a slight increase during the past week. Poor credit conditions among domestic consumers are probably responsible in part for slow buying by retailers, but stocks are so low that there must be a steady increase in buying from this quarter. The Lake trade is lagging behind normal. The improved domestic situation has not helped the domestic market and the additional screenings have been difficult to place. Consumption among manufacturers in this section is not what it should be.

LOUISVILLE

Slight activity due to some delayed buying. Prices firmer, though no higher.

A considerable improvement is noted in the Kentucky field, though principally as to the volume of business done rather than in prices. This is the natural increase which could not well be delayed longer and which in normal years is closed up before now.

Prices continue virtually unchanged, block ranging from $1.25 to $2, according to quality, etc., though it is said that there is more being sold on the higher levels than heretofore. Nut and slack is showing no variation of note.

COKE

CONNELLSVILLE

Prompt furnace coke has slumped further and contract quotations have become nominal. Iron and steel conditions improved, but Connellsville coke market evidently affected by continued erection of byproduct ovens. Production and shipments increased.

The general tone of the coke market has softened further. The surplus stocks already mentioned have not been dissipated by a decrease in production, as was expected would occur, and prompt furnace coke has been a drug on the market, being freely offered at $1.50 while it is possible that even this price has been shaded in some instances. Nominal asking prices on contract furnace coke are unchanged, but there has been no serious test as inquiry has amounted to practically nothing.

The operators are still convinced that there will be a heavy demand later, and fancy prices by the close of the year, based on the increasingly favorable developments in the iron and steel markets, but they have been expecting an improvement in coke for a long time without encountering tangible results. It is certainly anomalous that Connellsville coke should remain so low, when the steel mills are operating practically at capacity, and a firm pig-iron market has turned in the past fortnight into a sharply advancing one.

The only explanation is that byproduct coke has entered the situation so largely as to make it improbable, in the minds of buyers, that Connellsville coke can become scarce. Corrigan, McKinney & Co. last week signed a contract for 200 Koppers byproduct ovens, to be erected as rapidly as possible at the firm's site in Cleveland, where two merchant furnaces are in operation and two more, with a steel plant, are under construction, to be finished early in the new year. The 200 ovens are to supply all four of the blast furnaces.

The Connellsville coke market stands as follows, contract furnace quotations being practically nominal: Prompt furnace, $1.50; contract furnace to Oct. 1, $1.75; to Jan. 1, $1.85@2; prompt foundry, $2.20@2.40; contract foundry, $2.25@2.60, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended July 31 at 377,410 tons, an increase of 10,315 tons, and shipments at 373,182 tons, an increase of 12,230 tons.

Buffalo—There is a continuation of the good feeling in the trade, backed by many reports of a genuine stir in iron and steel. If this continues there will be as much coke called for as the ovens will want to turn out and prices will be firm. The price is advancing and nothing of fair quality can now be had at former quotations. The basis is best 72-hr. Connellsville at $4.30, with stock coke $3.35.

Chicago—Gas house coke is quiet, but byproduct egg, stove and nut have been in steady demand at good prices. Foundry coke has assumed a more determined stand, and prices are well maintained. Quotations are as follows: Byproduct, $4.65@5.10; Connellsville, $4.75; Wise County, $4.65@4.75; gas coke, $3.75@3.90, furnace, $4.85.

MIDDLE WESTERN

GENERAL REVIEW

Western situation quiet and shipments delayed by rainy weather. Confidence expressed in immediate future. Smokeless coals still virile. Western steam sizes slow. Anthracite dull.

The midsummer demand has not bettered this week. Continuous rainfalls are proving detrimental to a normal absorption of tonnage and have delayed threshing. Roads in the country districts are in such a condition that hauling cannot be done. About three weeks of hot dry weather is now needed. The backwardness of harvesting in the northwest is also causing delayed movement to that section.

But despite adverse weather conditions, there is some improvement on a small scale. Steel and manufacturing plants which take a considerable amount of coal are showing more activity; many steel plants in this territory are now operating to capacity, and allied manufacturing lines are showing sympathetic improvement. Evidently heavy movement of both grain and coal will occur simultaneously this year, and this may cause a serious congestion. The steam trade, however, is still behind the domestic.

The Chicago market is absolutely bare of consignment coal, which shows a healthy state of affairs. Screenings are if anything lower than last week, averaging between 65c. and 70c., with some shipments made at 60c. It is felt that the improvement shown in the industrial situation and settlement of building trade strikes in Chicago, will serve to strengthen the screenings market very shortly. An advance in the prices of domestic sizes became effective with many operators Aug. 1.

An increase is noted in the number of small orders which seems to indicate awakening interest on the part of the little consumer. In view of the general draggy conditions this summer, prices have remained remarkably steady. Although the demand is quiet, it is well established that there are very small stocks throughout the country districts, and as soon as the buying season once gets in full swing, there can hardly be any question but that the market will improve quickly.

CHICAGO

Price advances have little effect. Indiana grades especially slow. Anthracite heavy and no decision expected on the new rates for some time.

The marking up of 10c. per ton on Southern Illinois coarse sizes effective Aug. 1 has had but little apparent effect as yet. Carterville operators are also asking $1.60 for lump and egg, and $1.65 for No. 1 washed, while most of the operators in Williamson County are seeking to obtain $1.50, with a good many shipments going forward at from $1.35 to $1.40. Screenings are ranging around 65c. to 70c., and if fine coal continues downward, many Southern Illinois operators will probably store screenings on the ground pending a better outlook. The Saline County mines are running about half time, with no change in prices, and domestic shipments are rather slow.

No changes have been announced in Springfield district prices. Railroad tonnage for these mines has been somewhat below the minimum the last two weeks. Domestic lump shipments have been very slow, but screenings have gone forward in steady volume at prices ranging around 60 to 70c.

The demand for Indiana coal in this market is below normal and less shipments are going to Northwestern points. It was expected that there would be a revival of buying early in August, but it has not appeared. Domestic buying is slow, and the dealers have shown no tendency to place storage orders of any consequence as yet.

Pocahontas and New River smokeless coals are still very strong and active, although sales agents expected a lull in the demand. Lump and egg are firm at $2.25, and mine-run, $1.40. Splint is firmer.

Pennsylvania smokeless is being sold freely at July prices, but it is rumored a new circular will shortly be issued raising quotations.

Hocking lump is moving very slowly. There is a large tonnage of these coals at upper lake ports. Prices are fairly well maintained in the face of the adverse conditions.

The keen competition for tonnage by the Kentucky shippers causes sales at most any price, and the situation still continues unhealthy. Lump coal is sold all the way from $1.25 to $1.90, but the range is not so wide on other sizes.

It is said that the Interstate Commerce Commission will not make a decision as to the reasonableness of the 25c. advance in anthracite rates to Chicago until the case of the general anthracite rates and practices has been made public. Anthracite is very slow, and all-rail shippers to Chicago are absorbing the 25c. advance in freight rates, making no change in Chicago delivered prices, in order to compete with the docks. Buying at the end of July was of little moment, but there are some reports to the effect that the middle of August will see a considerable number of orders placed from the Chicago district and Ilinois points. Many inquiries have been made of wholesalers here regarding the effect the rate advance would have on prices, and asking for advice as to whether or not stocking should be done in August.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

Anthracite shipments for July and the first seven months of 1914-15 were as follows:

	July 1915	July 1914	7 Months 1915	7 Months 1914
Phila. & Reading	839,554	831,965	6,252,825	6,863,613
Lehigh Valley	1,024,611	1,026,225	7,324,459	7,181,300
Cent. R.R. of N.J.	597,992	708,891	4,396,841	5,097,978
Del. Lack. & West	542,775	826,771	5,111,383	5,425,277
Del. & Hudson	697,803	671,682	4,501,595	4,087,557
Pennsylvania	369,550	406,760	3,339,504	3,623,848
Erie	660,010	717,201	4,407,092	4,707,228
Ont. & Western	201,910	202,362	1,195,810	1,350,845
	4,934,205	5,391,857	36,529,509	38,337,646

Stocks at Tidewater July 31 were 636,384 tons.

SAULT STE. MARIE

Anthracite shipments through the Sault Ste. Marie Canals for July amounted to 315,374 tons and bituminous 1,759,178 tons.

THE CAR SITUATION

The total surplus of idle coal cars as of Aug. 10 was 74,488 and the shortage 414.

I. C. C. No. 6429—Parlin & Orendorff Co. vs. Cleveland, Cincinnati, Chicago & St. Louis R.R. Co., Et al.

Carload rate of $1.60 per ton on coke from Indianapolis, Ind., to Canton, Ill., not found unreasonable or unjustly discriminatory. Complaint dismissed.

Investigation and Suspension Docket No. 525—Coal rates from Illinois Mines to Omaha, Neb, and other points.

Proposed increase, from $2.05 to $2.25 per net ton, in the rate on bituminous coal from points on the Southern Railway in the Belleville district in Illinois to Omaha, Neb., and points grouped therewith, found to have been justified.

I. C. C. No. 7408—Reeves Coal Co., vs. Pere Marquette R.R. Co., et al.

A shipment of bituminous coal en route from La Follette, Tenn., to Vermilion, S. D., was ordered reconsigned to Ghent, Minn. Defendants failed to effect the reconsignment and higher charges were collected than would have accrued if complainant's instructions had been followed. Reparation awarded.

FOREIGN MARKETS

GREAT BRITAIN

July 30—The attention of the coal industry during the past week has been concentrated upon the Government's legislative efforts to limit prices, the chief new feature of which has been the decision of Mr. Runciman, at the eleventh hour, to partly include existing contracts within the scope of the act, after repeatedly declaring that he could consider nothing of the kind. No doubt the measure will cause much dissatisfaction in various ways, but the whole industry will doubtless be relieved to find that it knows the worst. The passage of the bill, which received the Royal assent yesterday, will at least enable traders to realize their actual position under the new measure and afford a basis upon which much business, which was suspended pending definite knowledge as to the intentions of the Government, can now be completed.—"The Iron and Coal Trades Review."

July 29—Business is virtually at a standstill as colliery owners are unable to accept fresh orders for prompt delivery. Colliery outputs are limited and as the authorities are taking a large proportion of the production, there is no prospect of a change for some little time. The following are the nominal quotations:

Best Welsh steam	Nominal	Best Monmouthshires	$6.96@7.20
Best seconds	Nominal	Seconds	6.72@6.96
Seconds	$6.96@7.20	Best Cardiff smalls	5.37@5.64
Best dry coals	6.72@7.20	Cargo smalls	4.44@4.80

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is much restricted owing to the scarcity of coal. Rates are nominally as follows:

Gibraltar	$3.36	Naples	$3.96	St. Vincent	$4.32
Marseilles	3.48	Alexandria	4.20	Rio de Janeiro	5.52
Algiers	3.89	Port Said	4.08	Monte Video	5.28
Genoa	3.90	Las Palmas	4.08	River Plate	5.52

FINANCIAL

St. Louis Rocky Mountain & Pacific Co.

(Seventh Annual Report—Year ended June 30, 1914.)

President J. van Houten reports for the year ended Sept. 15 as follows:

Results—The gross earnings were $2,457,178 [showing an increase of $217,694]; net earnings, $823,517. After deducting fixed charges, reserves for depreciation, etc., there is a net income for the year of $229,180.

Reduction of Liabilities—The company paid to the sinking fund Apr. 1, 1914, 3c. per ton on all coal mined during the preceding year, with which the trustee purchased and retired $47,000 bonds. Two-thirds of this amount was voluntarily paid in, as the mortgage requires the payment of only 1c. per ton of coal mined.

Improvements and Betterments—The disbursements during the year for improvements, betterments, additions, equipment, etc., at all the mines aggregated $109,886, of which $55,710 went for electrical equipment and power plants.

Sale of Railway—Change in Mortgage—The bondholders have been advised by circular of the plan of the directors (a) to sell the property of the St. Louis Rocky Mountain & Pacific Ry. to Atchison, Topeka & Santa Fé Ry. Co. for $3,000,000 Atchison 4% first mortgage gold bonds (a first lien on the property sold), and $50,000 in cash; and (b) to amend the gold mortgage of July 1, 1905, in a manner to enable the sale, to increase the annual sinking-fund payment to 3c. per ton of coal mined instead of 1c., and also to terminate the authority to issue additional bonds for extensions or betterments of the railway.

Electric Power—Your board has contracted with the Trinidad Electric Transmission Ry. & Gas Co. for all of the power used at your mines at a figure, which will not only enable us to make some saving in operating cost, but will also diminish the cost of opening new mines from time to time, as it will do away with the necessity of building individual power plants.

Dividends—The regular 5% for the year was paid on the preferred stock and 1% was paid on the common stock.

Outlook—The condition of our properties is satisfactory in every way. The market for coal in the Southwestern portion of the United States showed some improvement, and for coke a substantial increase over previous year, but there was almost a complete suspension of shipments to smelters, railroads and other customers in Mexico on account of the war and unsettled conditions in that country.

INCOME ACCOUNT FOR YEARS ENDING JUNE 30

	1913–14	1912-13	1911-12	1910-11

a The St. Louis Rocky Mountain & Pacific Ry. Co. is being operated by the Atchison, Topeka & Santa Fe Ry. under an option to purchase prior to July 1, 1915, the consideration being $3,000,000 4% bonds of A. T. & S. F. Co., payable as of Aug. 1, 1913; also a cash payment of $50,000 for materials and supplies on hand Aug. 1, 1913.

Note—For previous annual report of the company see Vol. V, p. 924.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

+Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared.

No.	Purchaser	City	State	Tonnage	Page
1012	Geo. M. Kellogg Co.	Pleasant Hill	Mo.	20 (cars)e	243
1034	Board of Education	Youngstown	Ohio	5,000	243
1043	L. A. Budlong Co.	Chicago	Ill.	12(cars)	116
1048	Colin Gardner Paper Co.	Middletown	Ohio	50,000	116
1123	Indiana State Sch. of Deaf	Indianapolis	Ind.	4,000a	158
1198	Ohio B. Administration	Columbus	Ohio	20,000	244

1210	The County Government	Buffalo	Minn.	100a	245

a Indicates bituminous. [2] Per month.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

1021—Kansas City, Mo.—The Western Sash & Door Co. announce that they will not contract as previously noted (p. 77). Address, F. J. Huttig, Western Sash & Door Co., Independence Rd. & White Ave., Kansas City, Mo.

1050—Kansas City, Mo.—Baker & Lockwood advise that no definite time has been set for letting this contract (p. 116), and that they may confine their purchases to the open market. Address Pur. Agt. C. R. Summerville, Baker & Lockwood, Wyandotte and 6th St., Kansas City, Mo.

+1051—Zanesville, Ohio—This contract (p. 116) will be let to local dealers who are able to make deliveries to the school buildings as required. Address Clk. C. J. Weaver, Bd. of Edu., Zanesville, Ohio.

+1058—Plymouth, Mass.—Bids have been received on this contract (p. 116), which provide for furnishing the county commissioners with coal, as follows:

	Lehigh Egg Coal	Pocahontas or Equal Grade
E. P. Reed Lumber Co., No. Abington	$6.40@6.60	$4.95
D. H. Craig, Plymouth	6.65	4.25
James Millar & Co., Plymouth	6.95	...
E. M. Alden Co., 94 Milk St., Boston	6.45@6.65	4.20

No notice has been received of any award as yet. Address County Comr. Lyman P. Thomas, Plymouth, Mass.

1060—Louisville, Ky.—This contract (p. 116), which provides for furnishing B. F. Avery & Sons with six months' supply of nut and slack coal, will not be awarded until about Aug. 15. Address Pur. Agt. J. W. Roelker, B. F. Avery & Sons, Louisville, Ky.

+1068—New York, N. Y.—All the bids on this contract (pp. 117, 243) have been rejected and new bids requested, which were opened Aug. 13. The amount of tonnage involved has been reduced from 3000 gross tons of egg coal to 1500 tons. Address Dock. Comr. R. A. C. Smith, Pier A, North River, New York.

+1125—Columbus, Ohio—All the bids on this contract (p. 158), which provides for furnishing the Department of Public Safety with 1250 tons of the best quality lump coal, have been rejected because of the reduction in freight rates of 15c. on the Hocking Valley Ry., which it is believed will affect the cost of the coal here. The new bids have been readvertised for and will be opened Aug. 17. The bids received on the present schedule were as follows: General Hocking Fuel Co., Columbus, West Virginia mine-run, $1.60; Hatton, Brown & Co., Columbus, Logan nut and slack, $1.45; Logan mine-run, $1.71; John M. Taylor Coal Co., Columbus, Hocking mine-run, $1.55; National Coal Co., Cleveland, Cambridge Hocking mine-run, $1.70; Victoria Coal Co., Columbus, Hocking nut, pea and slack, $1.23; Hocking mine-run, $1.53; New York Coal Co., Columbus, Hocking mine-run, $1.65; Moreland Coke Co., Pittsburgh, West Virginia mine-run, $1.58; Fletcher, Willaims Coal Co., Columbus, West Virginia nut, pea and slack, $1.12; West Virginia mine-run, $1.45; Elk Coal Co., Columbus, Cambridge Hocking, mine-run, $1.44; Hocking mine-run, $1.48; E. A. Cole & Co., Columbus, West Virginia mine-run, $1.64; Hocking mine-run, $1.64. Address Dir. of Public Safety B. L. Bargar, City Hall, Columbus, Ohio.

+1143—Spokane, Wash.—Bids on this contract (p. 199), which provides for furnishing coal for Lewis and Clark and North Central High Schools and Boulevard Park School were received until 7:30 p.m., Aug. 9. A certified check for $100 was required with each bid. Address Secy. E. A. Thomas, Bd. of Edu., Spokane, Wash.

+1146—Wichita, Kan.—This contract (p. 199), which provides for furnishing the local Board of Education with approximately 2500 tons of bituminous and semibituminous coal will be awarded Aug. 16. Address Clk. J. L. Leland, Bd. of Edu., City Hall, Wichita, Kan.

New Business

+1233—Dickinson, N. D.—The School Board at this place received bids until noon Aug. 10 for furnishing 500 tons of either mine-run or screened lignite coal, to be delivered at the local school buildings during the ensuing year. The successful bidder will be required to furnish a bond for $200. Address Clk. L. R. Merritt, Bd. of Edu. Dickinson, N. D.

1234—Kansas City, Mo.—The Consumers Bread Co. at this place consumes about 150 tons of coal per month, which they are at present buying in the open market, but are willing to consider a proposition for contracting. Cherokee slack coal is used. Address Pres. B. Howard Smith, Consumers Bread Co., Orear-Leslie Bldg., Kansas City, Mo.

1235—Chicago, Ill.—The American Linseed Co., of South Chicago, will contract about Sept. 15 for their annual requirements of coal, involving approximately 15,000 tons. Illinois or Indiana mine-run coal is used, and the contract will extend over one year. Address Purchasing Agent, American Linseed Co., South Chicago, Ill.

1236—Kansas City, Kan.—The packing house of Sulzberger & Sons at this place will not enter into a contract this year, but are willing to consider propositions to furnish their fuel requirements. They consume about 200 tons of slack coal per day. Address Purchasing Agent, Sulzberger & Sons, Kansas City, Kan.

+1237—Hamilton, Ohio—The Municipal Light and Power Plant at this place usually contracts some time in September for their annual requirements of coal, amounting to from 10,000 to 15,000 tons. Nut and slack grades are required and the usual price is $1.80 per ton. Address J. O'Toole, Municipal Light and Water Plant, Hamilton, Ohio.

+1238—Delaware, Ohio—The Board of Education for Delaware Township will receive sealed bids for furnishing coal required for various school buildings during the ensuing year until 8 p.m., Aug. 14. Bids are requested on Hocking, West Virginia, or Sunday Creek forked coal. Address Clk. E. E. Moeller, Delaware Township, Bd. of Edu. Delaware, Ohio.

+1239—Brookings, S. D.—The Board of County Commissioners, will receive bids until 2 p.m., Sept. 7, for furnishing 100 tons of bituminous, and 20 tons of anthracite coal. Address County Audr. F. H. Ripley, Bd. of County Comrs. Brookings, S. D.

+1240—Bellwood, Penn.—The Board of Education of Bellwood received sealed bids until 8 p.m., Aug. 6, for furnishing approximately 200 tons of bituminous mine-run coal to be delivered to the local school as required during the ensuing year. Address, Secy., E. N. Root, Bd. of School Dirs., School Dist. of Bellwood, Bellwood, Penn.

1241—Kansas City, Mo.—The Atlas Oats Co. at this place is buying coal in the open market, and will probably continue doing so, but is willing to consider a proposition covering two cars of Cherokee lump or nut coal per week. Address Purchasing Agent, Atlas Oats Co., 8th and Santa Fé St., Kansas City, Mo.

+1242—Jamestown, N. D.—The county government will receive bids until 2 p.m., Sept. 1, for furnishing 150 tons of lignite and 75 tons of smokeless. Bids should be submitted f.o.b. cars at Jamestown, and also delivered in bins at the court house. A bid on 20 tons of anthracite stove coal will also be received. Address County Auditor, Jamestown, N. D.

1243—Crystal Falls, Mich.—The Municipal Light and Water Plant at this place usually contracts some time in September for annual requirements of coal amounting to about 150 tons. Furnace coal is used almost exclusively, and the usual price is $8.25 per ton. Address City Clk. W. J. Gribble, Crystal Falls, Mich.

+1244—Delaware, Ohio—The county commissioners received sealed bids up to noon, Aug. 9, for furnishing 240 tons of 3-in. coal and 40 tons of washed nut, f.o.b. cars at Leonardsburg, Ohio. Address County Audr. W. D. Aldrich, Leonardsburg, Ohio.

+1245—Missoula, Mont.—The Board of Education at this place received sealed bids until 10 a.m., Aug. 13, for furnishing between 250 and 300 tons of coal to the high school building or gymnasium as may be required during the ensuing year. Address Secy. A. J. Violette, Bd. of Trustees, County High School, Missoula, Mont.

+1246—Fairmont, N. D.—The School Board here received bids until noon, Aug. 10, for furnishing two carloads of stove coal, one to be delivered in August and the other in January. Address Clk. F. E. Crafts, Bd. of Edu., Fairmont, N. D.

+1247—Jacksonville, Ill.—The Board of Education here received sealed bids until noon, Aug. 10, for furnishing coal to the public schools during the ensuing year. Mine-run and 3-in. lump are required. Address Clk. R. L. Pyatt, Bd. of Edu., Jacksonville, Ill.

+1248—Lake Park, Minn.—The Board of Education will receive bids until 6 p.m., Aug. 16, for furnishing 60 tons of Hocking Valley lump coal to be delivered on or before Sept. 1. Address Secy. Kristofer Delager, Bd. of Edu., Lake Park, Minn.

+1249—Ellwood City, Penn.—The Board of Education received sealed bids until 8 p.m., Aug. 13, for furnishing three-quarter lump, mine-run, pea and slack coal, to be delivered to the local schools as follows: Lawrence, 125 tons; Central school, 100 tons; West End, 50 tons; Circle, 50 tons; North Side, 40 tons. Address Secy. W. J. Moore, Bd. of Edu., Ellwood City, Penn.

+1250—Falls City, Neb.—The Board of Education received bids until Aug. 12 for furnishing 250 tons of steam coal for the high school and 125 tons of screened lump for the other buildings, 75 tons of lump coal to be delivered immediately and 50 tons the first of the year. Address Secy. F. Brecht, Bd. of Edu., Falls City, Neb.

1251—Redfield, Iowa—The Independent School District will receive bids until 2 p.m., Aug. 16, for furnishing approximately 100 tons of coal, one carload to be delivered by Sept. 15 and the balance as required. Address Clk. R. V. Seaman, Independent School District, Redfield, Iowa.

1252—Minot, N. D.—Sealed bids were received until 2 p.m., Aug. 10, for furnishing lignite coal to Schools Nos. 1, 2, 3 and 4 of the Burlington School District No. 7. Address Clk. W. E. Gross, Burlington School District No. 7, Minot, N. D.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

+No 691—Watervliet, N. Y.—This contract (Vol. 7, pp. 877, 1083), which provides for furnishing the Watervliet Arsenal with coal during the year ending June 30, has been awarded to the **Peterson & Parker Coal Co.,** Troy, N. Y., on the following basis: Bituminous steam, $3.50; anthracite pea, $3.95; buckwheat No. 1, $3.20 and No. 2, $2.40. Address Col. W. W. Gibson, Ordnance Dept., United States Army, Watervliet Arsenal, Watervliet, N. Y.

+No. 801—Henderson, Ky.—This contract (Vol. 7, pp. 1005, 1126, Vol. 8, p. 198), which provides for furnishing the local electric light station with approximately 9000 tons of pea and slack coal has been awarded to **R. A. Powell** of the St. Bernard Mining Co., at 85c. per ton. Address Supt. L. P. Hite, Municipal Light Station, Henderson, Ky.

+No. 821—Cranston, R. I.—This contract (Vol. 7, p. 1049, Vol. 8, p. 243), which provides for furnishing the local city government with approximately 1000 tons of white ash egg and stove coal has been awarded to the **Robert E. Smith Co.** and the **Eastern Coal Co.,** both of whom bid $6.36 per ton. H. C. Banows & Sons bid $6.74 per ton and the United Coal Co., $6.65 per ton. Address Deputy City Clk. L. A. Smith, Jr., City Hall, Cranston, R I.

+848—Chicago, Ill.—This contract (Vol. 7, p. **1049,** Vol. 8, p. 198), which provides for furnishing the Board of Education with its fuel requirements during the ensuing year has been awarded as follows:
